Though I have often spoke of that mean conception of our art which confines it to mere imitation, I must add, that it may be narrowed to such a mere matter of experiment, as to exclude from it the application of science, which alone gives dignity and compass to any art. But to find proper foundations for science is neither to narrow or to vulgarize it; and this is sufficiently exemplified in the success of experimental philosophy. It is the false system of reasoning, grounded on a partial view of things, against which I would most earnestly guard you. And I do it the rather, because those narrow theories, so coincident with the poorest and most miserable practice, and which are adopted to give it countenance, have not had their origin in the poorest minds, but in the mistakes, or possibly in the mistaken interpretations, of great and commanding authorities. We are not therefore in this case misled by feeling, but by false speculation.

When such a man as Plato speaks of painting as only an imitative art, and that our pleasure proceeds from observing and acknowledging the truth of the imitation, I think he misleads us by a partial theory.[37] It is in this poor, partial, and so far, false, view of the art, that Cardinal Bembo[38] has chosen to distinguish even Raphael himself, whom our enthusiasm honors with the name of divine. The same sentiment is adopted by Pope in his epitaph on Sir Godfrey Kneller,[39] and he turns the panegyric solely on imitation, as it is a sort of deception.

I shall not think my time misemployed, if by any means I may contribute to confirm your opinion of what ought to be the object of your pursuit; because, though the best critics must always have exploded this strange idea, yet I know that there is a disposition towards a perpetual recurrence to it, on account of its simplicity and superficial plausibility. For this reason I shall beg leave to lay before you a few thoughts on this subject; to throw out some hints that may lead your minds to an opinion (which I take to be the truth), that painting is not only to be considered as an imitation, operating by deception, but that it is, and ought to be, in many points of view, and strictly speaking, no imitation at all of external nature. Perhaps it ought to be as far removed from the vulgar idea of imitation, as the refined civilized state in which we live, is removed from a gross state of nature; and those who have not cultivated their imaginations, which the majority of mankind certainly have not, may be said, in regard to arts, to continue in this state of nature. Such men will always prefer imitation to that excellence which is addressed to another faculty that they do not possess; but these are not the persons to whom a painter is to look, any more than a judge of morals and manners ought to refer controverted points upon those subjects to the opinions of people taken from the banks of the Ohio, or from New Holland.

It is the lowest style only of arts, whether of painting, poetry, or music, that may be said, in the vulgar sense, to be naturally pleasing. The higher efforts of those arts, we know by experience, do not affect minds wholly uncultivated. This refined taste is the consequence of education and habit; we are born only with a capacity of entertaining this refinement, as we are born with a disposition to receive and obey all the rules and regulations of society; and so far it may be said to be natural to us, and no further.

What has been said, may shew the artist how necessary it is, when he looks about him for the advice and criticism of his friends, to make some distinction of the character, taste, experience, and observation in this art, of those, from whom it is received. An ignorant uneducated man may, like Apelles' critic, be a competent judge of the truth of the representation of a sandal;[40] or to go somewhat higher, like Molière's[41] old woman, may decide upon what is nature, in regard to comic humor; but a critic in the higher style of art, ought to possess the same refined taste, which directed the artist in his work.

To illustrate this principle by a comparison with other arts, I shall now produce some instances to shew, that they, as well as our own art, renounce the narrow idea of nature, and the narrow theories derived from that mistaken principle, and apply to that reason only which informs us not what imitation is, a natural representation of a given object, but what it is natural for the imagination to be delighted with. And perhaps there is no better way of acquiring this knowledge, than by this kind of analogy: each art will corroborate and mutually reflect the truth on the other. Such a kind of juxtaposition may likewise have this use, that whilst the artist is amusing himself in the contemplation of other arts, he may habitually transfer the principles of those arts to that which he professes; which ought to be always present to his mind, and to which everything is to be referred.

---

[37] *Republic* (above, page 31).

[38] Pietro Bembo (1470–1547), author and churchman.

[39] Sir Godfrey Kneller (1646–1723), English painter. Reynolds narrowly reads lines from Pope as praising imitation: "... whose art of Nature, and whose pictures thought"; "Living, great Nature fear'd he might outvie/Her works...."

[40] Burke (above, page 336), and Johnson (above, page 359).

[41] Molière (Jean Baptiste Poquelin, 1622–1673), French dramatist.

So far is art from being derived from, or having any immediate intercourse with, particular nature as its model, that there are many arts that set out with a professed deviation from it.

This is certainly not so exactly true in regard to painting and sculpture. Our elements are laid in gross common nature, an exact imitation of what is before us: but when we advance to the higher state, we consider this power of imitation, though first in the order of acquisition, as by no means in the scale of perfection.

Poetry addresses itself to the same faculties and the same dispositions as painting, though by different means. The object of both is to accommodate itself to all the natural propensities and inclinations of the mind. The very existence of poetry depends on the license it assumes of deviating from actual nature, in order to gratify natural propensities by other means, which are found by experience full as capable of affording such gratification. It sets out with a language in the highest degree artificial, a construction of measured words, such as never is, nor ever was used by man. Let this measure be what it may, whether hexameter or any other meter used in Latin or Greek—or rhyme, or blank verse varied with pauses and accents, in modern languages—they are all equally removed from nature, and equally a violation of common speech. When this artificial mode has been established as the vehicle of sentiment, there is another principle in the human mind, to which the work must be referred, which still renders it more artificial, carries it still further from common nature, and deviates only to render it more perfect. That principle is the sense of congruity, coherence, and consistency, which is a real existing principle in man; and it must be gratified. Therefore having once adopted a style and a measure not found in common discourse, it is required that the sentiments also should be in the same proportion elevated above common nature, from the necessity of there being an agreement of the parts among themselves, that one uniform whole may be produced.

To correspond therefore with this general system of deviation from nature, the manner in which poetry is offered to the ear, the tone in which it is recited, should be as far removed from the tone of conversation, as the words of which that poetry is composed. This naturally suggests the idea of modulating the voice by art, which I suppose may be considered as accomplished to the highest degree of excellence in the recitative of the Italian opera; as we may conjecture it was in the chorus that attended the ancient drama. And though the most violent passions, the highest distress, even death itself, are expressed in singing or recitative, I would not admit as sound criticism the condemnation of such exhibitions on account of their being unnatural.

If it is natural for our senses, and our imaginations, to be delighted with singing, with instrumental music, with poetry, and with graceful action, taken separately; (none of them being in the vulgar sense natural, even in that separate state); it is conformable to experience, and therefore agreeable to reason as connected with and referred to experience, that we should also be delighted with this union of music, poetry, and graceful action, joined to every circumstance of pomp and magnificence calculated to strike the senses of the spectator. Shall reason stand in the way, and tell us we ought not to like what we know we do like, and prevent us from feeling the full effect of this complicated exertion of art? This is what I would understand by poets and painters being allowed to dare everything; for what can be more daring, than accomplishing the purpose and end of art, by a complication of means, none of which have their archetypes in actual nature?

So far therefore is servile imitation from being necessary, that whatever is familiar, or in any way reminds us of what we see and hear every day, perhaps does not belong to the higher provinces of art, either in poetry or painting. The mind is to be transported, as Shakespeare expresses it, "beyond the ignorant present,"[42] to ages past. Another and a higher order of beings is supposed; and to those beings everything which is introduced into the work must correspond. Of this conduct, under these circumstances, the Roman and Florentine schools afford sufficient examples. Their style by this means is raised and elevated above all others, and by the same means the compass of art itself is enlarged.

We often see grave and great subjects attempted by artists of another school; who, though excellent in the lower class of art, proceeding on the principles which regulate that class, and not recollecting, or not knowing, that they were to address themselves to another faculty of the mind, have become perfectly ridiculous.

---

[42] *Macbeth* I, v: 54–5.

The picture which I have at present in my thoughts is a sacrifice of Iphigenia, painted by Jan Steen,[43] a painter of whom I have formerly had occasion to speak with the highest approbation; and even in this picture, the subject of which is by no means adapted to his genius, there is nature and expression; but it is such expression, and the countenances are so familiar, and consequently so vulgar, and the whole accompanied with such finery of silks and velvet, that one would be almost tempted to doubt, whether the artist did not purposely intend to burlesque his subject.

Instances of the same kind we frequently see in poetry. Parts of Hobbes's[44] translation of Homer are remembered and repeated merely for the familiarity and meanness of their phraseology, so ill corresponding with the ideas which ought to have been expressed, and, as I conceive, with the style of the original.

We may proceed in the same manner through the comparatively inferior branches of art. There are in works of that class, the same distinction of a higher and a lower style; and they take their rank and degree in proportion as the artist departs more, or less, from common nature, and makes it an object of his attention to strike the imagination of the spectator by ways belonging specially to art—unobserved and untaught out of the school of its practice.

If our judgments are to be directed by narrow, vulgar, untaught or rather ill-taught reason, we must prefer a portrait by Denner[45] or any other high finisher, to those of Titian or Van Dyck; and a landskip of Vanderhyde[46] to those of Titian or Rubens; for they are certainly more exact representations of nature.

If we suppose a view of nature represented with all the truth of the camera obscura,[47] and the same scene represented by a great artist, how little and mean will the one appear in comparison of the other, where no superiority is supposed from the choice of the subject. The scene shall be the same, the difference only will be in the manner in which it is presented to the eye. With what additional superiority then will the same artist appear when he has the power of selecting his materials, as well as elevating his style? Like Nicolas Poussin, he transports us to the environs of ancient Rome, with all the objects which a literary education makes so precious and interesting to man: or, like Sebastian Bourdon,[48] he leads us to the dark antiquity of the pyramids of Egypt; or, like Claude Lorrain, he conducts us to the tranquility of Arcadian scenes and fairyland.

Like the history-painter, a painter of landskips in this style and with this conduct, sends the imagination back into antiquity; and, like the poet, he makes the elements sympathize with his subject: whether the clouds roll in volumes like those of Titian or Salvator Rosa,[49] or, like those of Claude, are gilded with the setting sun; whether the mountains have sudden and bold projections, or are gently sloped; whether the branches of his trees shoot out abruptly in right angles from their trunks, or follow each other with only a gentle inclination. All these circumstances contribute to the general character of the work, whether it be of the elegant, or of the more sublime kind. If we add to this the powerful materials of lightness and darkness, over which the artist has complete dominion, to vary and dispose them as he pleases; to diminish, or increase them as will best suit his purpose, and correspond to the general idea of his work: a landskip thus conducted, under the influence of a poetical mind, will have the same superiority over the more ordinary and common views, as Milton's *Allegro* and *Penseroso* have over a cold prosaic narration or description; and such a picture would make a more forcible impression on the mind than the real scenes, were they presented before us.

If we look abroad to other arts, we may observe the same distinction, the same division into two classes, each of them acting under the influence of two different principles, in which the one follows nature, the other varies it, and sometimes departs from it.

The theater, which is said "to hold the mirror up to nature," comprehends both those ideas. The lower kind of comedy, or farce, like the inferior style of painting, the more naturally it is represented, the better; but the higher appears to me to aim no more at imitation, so far as it belongs to anything like deception, or to expect that the spectators should think that the events there represented are really passing before them, than Raphael in his cartoons, or Poussin in his sacraments, expected it to be believed, even for a moment, that what they exhibited were real figures.

For want of this distinction, the world is filled with false criticism. Raphael is praised for naturalness and deception, which he certainly has not accomplished, and as certainly never intended; and our late great actor Garrick, has been as ignorantly praised by his friend Fielding;[50] who doubtless imagined he had hit upon an ingenious device, by introducing in one of his novels (otherwise a work of the highest merit), an ignorant man, mistaking Garrick's representation of a scene in Hamlet, for reality. A very little reflection will convince us, that there is no one circumstance in the whole scene that is of the nature of deception. The merit and excellence of Shakespeare and of Garrick, when they were engaged in such scenes, is of a different and much higher kind. But what adds to the falsity of this intended compliment, is, that the best stage representation appears even more unnatural to a person of such a character, who is supposed never to have seen a play before, than it does to those who have had a habit of allowing for those necessary deviations from nature which the art requires.[51]

---

[43] Jan Steen (1626–1679), Dutch painter.

[44] Thomas Hobbes (1588–1679), English philosopher.

[45] Balthasar Denner (1685–1749), German painter.

[46] Jan van der Heyden (1637–1712), English painter.

[47] A dark enclosure or box that produces an image on a mirror.

[48] Sebastien Bourdon (1616–1671), French painter.

[49] Salvator Rosa (1615–1673), Italian painter.

[50] David Garrick (1717–1779), English actor; Henry Fielding (1707–1754), English novelist.

In theatric representation, great allowances must always be made for the place in which the exhibition is represented; for the surrounding company, the lighted candles, the scenes visibly shifted in your sight; and the language of blank verse, so different from common English; which merely as English must appear surprising in the mouths of Hamlet, and all the court and natives of Denmark. These allowances are made; but their being made puts an end to all manner of deception: and further; we know that the more low, illiterate, and vulgar any person is, the less he will be disposed to make these allowances, and of course to be deceived by any imitation; the things in which the trespass against nature and common probability is made in favor of the theater, being quite within the sphere of such uninformed men.

Though I have no intention of entering into all the circumstances of unnaturalness in theatrical representations, I must observe, that even the expression of violent passion, is not always the most excellent in proportion as it is the most natural: so great terror and such disagreeable sensations may be communicated to the audience, that the balance may be destroyed by which pleasure is preserved, and holds its predominancy in the mind: violent distortion of action, harsh screamings of the voice, however great the occasion, or however natural on such occasion, are therefore not admissible in the theatric art. Many of these allowed deviations from nature arise from the necessity which there is, that everything should be raised and enlarged beyond its natural state; that the full effect may come home to the spectator, which otherwise would be lost in the comparatively extensive space of the theater. Hence the deliberate and stately step, the studied grace of action, which seems to enlarge the dimensions of the actor, and alone to fill the stage. All this unnaturalness, though right and proper in its place, would appear affected and ridiculous in a private room; *quid enim deformius, quam scenam in vitam transferre?*[52]

And here I must observe, and I believe it may be considered as a general rule, that no art can be engrafted with success on another art. For though they all profess the same origin, and to proceed from the same stock, yet each has its own peculiar modes both of imitating nature, and of deviating from it, each for the accomplishment of its own particular purpose. These deviations, more especially, will not bear transplantation to another soil.

If a painter should endeavor to copy the theatrical pomp and parade of dress and attitude, instead of that simplicity, which is not a greater beauty in life, than it is in painting, we should condemn such pictures as painted in the meanest style.

So also gardening, as far as gardening is an art, or entitled to that appellation, is a deviation from nature; for if the true taste consists, as many hold, in banishing every appearance of art, or any traces of the footsteps of man, it would then be no longer a garden. Even though we define it, "Nature to advantage dressed,"[53] and in some sense it is such, and much more beautiful and commodious for the recreation of man; it is however, when so dressed, no longer a subject for the pencil of a landskip-painter, as all landskip-painters know, who love to have recourse to nature herself, and to dress her according to the principles of their own art; which are far different from those of gardening, even when conducted according to the most approved principles, and such as a landskip-painter himself would adopt in the disposition of his own grounds, for his own private satisfaction.

I have brought together as many instances as appear necessary, to make out the several points which I wished to suggest to your consideration in this discourse; that your own thoughts may lead you further in the use that may be made of the analogy of the arts, and of the restraint which a full understanding of the diversity of many of their principles ought to impose on the employment of that analogy.

The great end of all those arts is, to make an impression on the imagination and the feeling. The imitation of nature frequently does this. Sometimes it fails, and something else succeeds. I think therefore the true test of all the arts, is not solely whether the production is a true copy of nature, but whether it answers the end of art, which is to produce a pleasing effect upon the mind.

[51] Johnson (above, page 367).

[52] "For what is more disgraceful than translating what belongs on the stage into life." For another view, see Wilde (below page 713).

[53] Pope, *Essay on Criticism* (above, page 298).

It remains only to speak a few words of architecture, which does not come under the denomination of an imitative art. It applies itself, like music (and I believe we may add poetry) directly to the imagination, without the intervention of any kind of imitation.

There is in architecture, as in painting, an inferior branch of art, in which the imagination appears to have no concern. It does not however acquire the name of a polite and liberal art, from its usefulness, or administering to our wants or necessities, but from some higher principle: we are sure that in the hands of a man of genius it is capable of inspiring sentiment, and of filling the mind with great and sublime ideas.

It may be worth the attention of artists, to consider what materials are in their hands, that may contribute to this end; and whether this art has it not in its power to address itself to the imagination with effect, by more ways than are generally employed by architects.

To pass over the effect produced by that general symmetry and proportion, by which the eye is delighted, as the ear is with music, architecture certainly possesses many principles in common with poetry and painting. Among those which may be reckoned as the first, is, that of affecting the imagination by means of association of ideas. Thus, for instance, as we have naturally a veneration for antiquity, whatever building brings to our remembrance ancient customs and manners, such as the castles of the barons of ancient chivalry, is sure to give this delight. Hence it is that "towers and battlements"[54] are so often selected by the painter and the poet, to make a part of the composition of their ideal landskip; and it is from hence in a great degree, that in the buildings of Vanbrugh,[55] who was a poet as well as an architect, there is a greater display of imagination, than we shall find perhaps in any other; and this is the ground of the effect which we feel in many of his works, notwithstanding the faults with which many of them are justly charged. For this purpose, Vanbrugh appears to have had recourse to some principles of the Gothic architecture; which, not so ancient as the Grecian, is more so to our imagination, with which the artist is more concerned than with absolute truth.

The barbaric splendor of those Asiatic buildings, which are now publishing by a member of this Academy, may possibly, in the same manner, furnish an architect, not with models to copy, but with hints of composition and general effect, which would not otherwise have occurred.

It is, I know, a delicate and hazardous thing (and as such I have already pointed it out), to carry the principles of one art to another, or even to reconcile in one object the various modes of the same art, when they proceed on different principles. The sound rules of the Grecian architecture are not to be lightly sacrificed. A deviation from them, or even an addition to them, is like a deviation or addition to, or from, the rules of other arts, fit only for a great master, who is thoroughly conversant in the nature of man, as well as all combinations in his own art.

It may not be amiss for the architect to take advantage sometimes of that to which I am sure the painter ought always to have his eyes open, I mean the use of accidents; to follow when they lead, and to improve them, rather than always to trust to a regular plan. It often happens that additions have been made to houses, at various times, for use or pleasure. As such buildings depart from regularity, they now and then acquire something of scenery by this accident, which I should think might not unsuccessfully be adopted by an architect, in an original plan, if it does not too much interfere with convenience. Variety and intricacy is a beauty and excellence in every other of the arts which address the imagination; and why not in architecture?

The forms and turnings of the streets of London, and other old towns, are produced by accident, without any original plan or design; but they are not always the less pleasant to the walker or spectator, on that account. On the contrary, if the city had been built on the regular plan of Sir Christopher Wren,[56] the effect might have been, as we know it is in some new parts of the town, rather unpleasing; the uniformity might have produced weariness, and a slight degree of disgust.

I can pretend to no skill in the detail of architecture. I judge now of the art, merely as a painter. When I speak of Vanbrugh, I mean to speak of him in the language of our art. To speak then of Vanbrugh in the language of a painter, he had originality of invention, he understood light and shadow, and had great skill in composition. To support his principal object, he produced his second and third groups or masses; he perfectly understood in his art what is the most difficult in ours, the conduct of the background, by which the design and invention is set off to the greatest advantage. What the background is in painting, in architecture is the real ground on which the building is erected; and no architect took greater care than he that his work should not appear crude and hard: that is, it did not abruptly start out of the ground without expectation or preparation.

This is a tribute, which a painter owes to an architect who composed like a painter; and was defrauded of the due reward of his merit by the wits of his time, who did not understand the principles of composition in poetry better than he; and who knew little, or nothing, of what he understood perfectly, the general ruling principles of architecture and painting. His fate was that of the great Perrault;[57] both were the objects of the petulant sarcasms of factious men of letters; and both have left some of the fairest ornaments which to this day decorate their several countries; the façade of the Louvre, Blenheim, and castle Howard.

[54] John Milton (1608–1674), *L'Allegro*, 77.

[55] Sir John Vanbrugh (1664–1726), English architect and dramatist.

[56] Sir Christopher Wren (1632–1723), English architect and astronomer.

Upon the whole, it seems to me, that the object and intention of all the arts is to supply the natural imperfection of things, and often to gratify the mind by realizing and embodying what never existed but in the imagination.

It is allowed on all hands, that facts, and events, however they may bind the historian, have no dominion over the poet or the painter. With us, history is made to bend and conform to this great idea of art. And why? Because these arts, in their highest province, are not addressed to the gross senses, but to the desires of the mind, to that spark of divinity which we have within, impatient of being circumscribed and pent up by the world which is about us. Just so much as our art has of this, just so much of dignity, I had almost said of divinity, it exhibits; and those of our artists who possessed this mark of distinction in the highest degree, acquired from thence the glorious appellation of divine.

---

[57] Claude Perrault (1613–1688), French architect.

Immanuel Kant

1724–1804

Kant's three famous critiques, those of *Pure Reason, Practical Reason,* and *Judgment,* are expressions of his critical philosophy, based on the transcendental employment of our cognitive faculties. By "transcendental" Kant does not imply transcendence of the phenomenal world, as in Plato, but rather an account of all knowledge that is occupied not so much with objects as with the mode of our knowledge insofar as this mode of knowledge is possible *a priori.* Kant's critical project, which he described as a "Copernican Revolution in Philosophy," thereby hinges on the discovery or deduction of universal concepts that govern the operation of the faculties of reason, understanding, and judgment.

Writing after the *Critique of Pure Reason,* Kant remarked that he had been "awakened from his dogmatic slumbers" by the skepticism of David Hume, which called into question even the idea of cause and effect. Kant's "critical" turn, accordingly, consists in asking the radical question of how it is possible for us to have knowledge of any kind instead of debating any particular claims to knowledge. While this makes Kant notoriously difficult to read since he is endeavoring to explicate not things we think about but the concepts without which we could not think at all, the language of his own arguments necessarily relies on the very concepts he would explain. Kant, however, did not develop any sustained theory of language, nor any theory of symbolic mediation, both problems taken up in various ways by his subsequent followers and critics, notably, von Humboldt (below, page 523) and Cassirer (below, page 1016) on the continent, and Coleridge (below, page 493), and C. S. Peirce (below, page 652) in England and America.

His *Critique of Judgment* as the third and final component of the Critical Philosophy has always presented unusual problems. Read thematically, it can be taken as primarily a discourse on the aesthetic and more particularly, on the concepts of the beautiful and the sublime. In the context of the other critiques, however, *Critique of Judgment* both draws upon and complicates the epistemological position he expounded in the *Critique of Pure Reason.* There he proposed the existence of the "manifold of sensation," the raw data that is then collected and synthesized through the creative power of the sensibility. The sensibility abstracts from the manifold, formulating the world intellectually according to time and space, the *a priori* forms of "inner" and "outer" sense. Kant argues that we can never know directly "things in themselves"; all we perceive are appearances, intelligible to us only as they conform to our ideas of time and space. At a higher level, further removed from direct sensation, the understanding comes into play and schematizes our sensible experience according to logical "categories"—unity, plurality, totality, substance, causation, and so on. These categories are the *a priori* concepts of the understanding, not derived or inferred from experience but the very concepts without which experience itself would be unintelligible to us. Just as the sensibility is limited by the forms of space and time, the understanding cannot think outside of the categories, even though it is the faculty of knowledge par excellence. The faculty of Reason stands in need of a critique because it is inherently prone to claim knowledge concerning God, Freedom, and Immortality (the "Ideas of Reason") that cannot be established or determined but inevitably leads to contradictions or antinomies. The role of Reason, therefore, is not to produce knowledge but to regulate and guide the Understanding toward its fullest and most unified employment.

Judgment for Kant is the power of cognitive decision, or "thinking the particular as contained under the universal," but his problem is to ascertain first if there is an *a priori* concept or principle for judgment itself, and secondly to determine what it is. Kant separates judgments into two kinds, the "determinant," applying to instances in which the universal is given and the task is to determine if the particular fits under it; and the "reflective," applying to cases where the particular is given for which a universal (if there is one) is to be found. This simple distinction, however, has the potential to severely disturb the edifice of Kant's Critical Philosophy, since it shifts the focus away from the determinant judgment (where Understanding legislates) to the reflective judgment, where discovery, invention, or creation take precedence—subjects that are accorded only the most rudimentary treatment in the *Critique of Pure Reason.* The dominant topics of the third critique, the aesthetic and the teleological judgment, are both reflective, not determinant.

From this point of view, the problems of the beautiful and the sublime, the natural focus of literary and aesthetic commentary, divide quite sharply from Kant's problem, which is to find in our own constitution the ground for an *a priori* principle that is legislative for the faculty of judgment itself. His solution lies in the concept of purposiveness, whether it pertains to human productions (the aesthetic) or the productions of nature (the teleological).

When Kant treats aesthetic purposiveness somewhat paradoxically as purpose without purpose, what is at stake is the idea that any concept of an object which contains, as Kant puts it, "the ground of the actuality of the object," identifies a purpose. That is, we conceive of objects by considering how they are created or made, positing an intelligence or understanding compatible with our own, and only then do we think that we understand the object in question. He therefore defines the "*purposiveness* of [the] form" as "the agreement of a thing with that constitution of things which is only possible according to purposes."[1] Here, Kant returns without comment to the classical problem in Aristotle of *telos* or "final cause," but locates it as an *a priori* principle of judgment, not a property or observable characteristic of things, be they natural or artificial. We understand just what we can bring into agreement with the idea of a world of intentional creation.

When Kant turns to aesthetic judgments, he identifies two kinds, those of the beautiful and those of the sublime. Neither type can be called objective or logical. Both are subjective, but Kant declares that a true aesthetic judgment has subjective universality; that is, one makes it only if one is willing honestly to think that others should also make it. Feelings of sheer pleasure and pain are distinguished from aesthetic judgments, for the former are subjective and individual (some people may like beets, some may not), while the latter, though subjective, are universal. Such judgments Kant characterizes as "disinterested" because they are not referable to one's own feelings of pleasure, pain, prejudice, or personal interest.

Kant argues that in order to find an object beautiful we need therefore not have a concept of how by some idealized standard it is to be used or ought to be used. To make that kind of judgment is to refer the object to how well it measures up to some preconceived and therefore external ideal or purpose and thus to make a judgment other than aesthetic. Instead, as he indicates in section 9 of the "Analytic of the Beautiful," our attention should attend to how something is *made,* since the pleasure of the aesthetic judgment follows and does not precede the judgment itself. Therefore each aesthetic judgment is by necessity singular. One can declare a certain rose to be beautiful, but to say that all roses are beautiful is to make a determinative judgment or logical generalization based on what has been a series of singular aesthetic ones.

---

[1] *Critique of Judgment,* J. H. Bernard, trans., p. 17.

Clearly the notion of accuracy implied by the Platonic idea of imitation is, for Kant, irrelevant to aesthetic judgment; and the notion of the external idea of beauty that Plato proposes is self-contradictory. All neoclassical external canons of beauty are likewise not aesthetic judgments. Thus Kant's aesthetic theory is perhaps a more radical departure from the tradition of the theory of art and literature than even his epistemology is for philosophy.

In Kant's theorizing we can observe a shift of the problem of the subjective from the situation worried about by the followers of Locke (for example, Hume, above, page 322) toward concern with the internality of the work of art itself. Subjectivity is not abandoned, but the concept of subjective universality and disinterest turns consideration of aesthetic experience toward concern with the work's internal purpose rather than any external purposes it may be put to fulfilling. Even though Kant ultimately refers all experience of art back to the viewer, listener, or reader, he insists that we must talk about the work's beauty *as if* that beauty is determinable independent of us and *as if* the work is an object apart from us with its own being. This being is exactly what Plato's Ion (above, page 10) failed to assert against Socrates's relentless questioning.

The sublime differs from the beautiful. There are two forms of it, the mathematical and the dynamical. The former is concerned with size, the latter with power. The beautiful implies form and boundary, while the sublime implies either infinite size or overwhelming power, that which is "absolutely great." To our imagination, the sublime object is formless and beyond cognition. We take pleasure in the sublime experience even as we recognize our fear, because we see in the experience that we possess a faculty of mind that surpasses all sense. Thus what we really experience as sublime in such situations is our own sublimity or boundlessness of soul. The sublime does not lead to the disinterested contemplative feeling of the beautiful. Rather, it produces depth of feeling that yet also is free of sheer pain and pleasure, though it must overcome the former before experiencing the latter. Thus the sublime object can finally also be regarded as possessing internal purposiveness and our response to it ultimate disinterest.

Critique of Judgment is without question the most influential work of aesthetic theory ever written. It has generated many followers; most of those with other views on the subject have found it necessary to argue with Kant. In modern criticism, Kantian tendencies may be observed in the New Criticism in America, represented below by Ransom (page 953) and Brooks (page 1035).

Among the most useful translations of Kant's works are *Critique of Judgment,* translated by J. H. Bernard, second edition, revised (1951); *Prolegomena to Any Future Metaphysics,* translated by Paul Carus (1902); *Critique of Pure Reason,* translated by Norman Kemp Smith, revised edition (1933); *Critique of Practical Reason,* translated by Lewis W.

Beck (1949); and *Observations on the Feelings of the Beautiful and Sublime,* translated by J. T. Goldthwaite (1960). A new uniform edition under the general editorship of Paul Guyer, however, is in progress from Cambridge University Press. Among the great number of studies of Kant, some of the most useful are Norman Kemp Smith, *A Commentary on Kant's* Critique of Pure Reason, second edition, revised (1929); René Wellek, *Immanuel Kant in England* (1931); H. N. Lee, "Kant's Theory of Aesthetics," P. F. Strawson, *The Bounds of Sense: An Essay on Kant's Critique of Pure Reason* (1966); Jonathan Bennett, *Kant's Analytic* (1966), and *Kant's Dialectic* (1974); Ted Cohen and Paul Guyer, eds., *Essays in Kant's Aesthetics* (1982); Gary Banham, *Kant and the Ends of Aesthetics* (2000); Rodolphe Gauché, *The Idea of Form: Rethinking Kant's Aesthetics* (2003).

Critique of Judgment

from

Introduction

IV. Of Judgment as a Faculty Legislating a Priori

Judgment in general is the faculty of thinking the particular as contained under the universal. If the universal (the rule, the principle, the law) be given, the judgment which subsumes the particular under it (even if, as transcendental judgment, it furnishes, *a priori,* the conditions in conformity with which subsumption under that universal is alone possible) is *determinant.* But if only the particular be given for which the universal has to be found, the judgment is merely *reflective.*

The determinant judgment only subsumes under universal transcendental laws given by the understanding; the law is marked out for it, *a priori,* and it has therefore no need to seek a law for itself in order to be able to subordinate the particular in nature to the universal. But the forms of nature are so manifold, and there are so many modifications of the universal transcendental natural concepts left undetermined by the laws given, *a priori,* by the pure understanding—because these only concern the possibility of a nature in general (as an object of sense)—that there must be laws for these [forms] also. These, as empirical, may be contingent from the point of view of *our* understanding; and yet, if they are to be called laws (as the concept of a nature requires), they must be regarded as necessary in virtue of a principle of the unity of the manifold, though it be unknown to us. The reflective judgment, which is obliged to ascend from the particular in nature to the universal, requires on that account a principle that it cannot borrow from experience, because its function is to establish the unity of all empirical principles under higher ones, and hence to establish the possibility of their systematic subordination. Such a transcendental principle, then, the reflective judgment can only give as a law from and to itself. It cannot derive it from outside (because then it would be the determinant judgment); nor can it prescribe it to nature, because reflection upon the laws of nature adjusts itself by nature, and not nature by the conditions according to which we attempt to arrive at a concept of it which is quite contingent in respect of nature.

This principle can be no other than the following: As universal laws of nature have their ground in our understanding, which prescribes them to nature (although only according to the universal concept of it as nature), so particular empirical laws, in respect of what is in them left undetermined by these universal laws, must be considered in accordance with such a unity as they would have if an understanding (although not our understanding) had furnished them to our cognitive faculties, so as to make possible a system of experience according to particular laws of nature. Not as if, in this way, such an understanding must be assumed as actual (for it is only our reflective judgment to which this idea serves as a principle—for reflecting, not for determining); but this faculty thus gives a law only to itself, and not to nature.

Now the concept of an object, so far as it contains the ground of the actuality of this object, is the *purpose;* and the agreement of a thing with that constitution of things which is only possible according to purposes is called the *purposiveness* of its form. Thus the principle of judgment, in respect of the form of things of nature under empirical laws generally, is the *purposiveness of nature* in its variety. That is, nature is represented by means of this concept as if an understanding contained the ground of the unity of the variety of its empirical laws.

Kant's *Kritik der Urteilskraft* was first published in 1790. The text is from the second edition, revised, of the translation by J. H. Bernard (New York: Hafner Publishing Co., Inc., 1951).

The purposiveness of nature is therefore a particular concept, *a priori*, which has its origin solely in the reflective judgment. For we cannot ascribe to natural products anything like a reference of nature in them to purposes; we can only use this concept to reflect upon such products in respect of the connection of phenomena which is given in them according to empirical laws. This concept is alo quite different from practical purposiveness (in human art or in morals), though it is certainly thought according to the analogy of these last.

First Book

Analytic of the Beautiful

First Moment

Of the Judgment of Taste,[1] According to Quality

I. The Judgment of Taste Is Aesthetical

In order to distinguish whether anything is beautiful or not, we refer the representation, not by the understanding to the object for cognition, but by the imagination (perhaps in conjunction with the understanding) to the subject and its feeling of pleasure or pain. The judgment of taste[2] is therefore not a judgment of cognition, and is consequently not logical but aesthetical, by which we understand that whose determining ground can be *no other than subjective.* Every reference of representations, even that of sensations, may be objective (and then it signifies the real [element] of an empirical representation), save only the reference to the feeling of pleasure and pain, by which nothing in the object is signified, but through which there is a feeling in the subject as it is affected by the representation.

To apprehend a regular, purposive building by means of one's cognitive faculty (whether in a clear or a confused way of representation) is something quite different from being conscious of this representation as connected with the sensation of satisfaction. Here the representation is altogether referred to the subject and to its feeling of life, under the name of the feeling of pleasure or pain. This establishes a quite separate faculty of distinction and of judgment, adding nothing to cognition, but only comparing the given representation in the subject with the whole faculty of representations, of which the mind is conscious in the feeling of its state. Given representations in a judgment can be empirical (consequently, aesthetical); but the judgment which is formed by means of them is logical, provided they are referred in the judgment to the object. Conversely, if the given representations are rational, but are referred in a judgment simply to the subject (to its feeling), the judgment is so far always aesthetical.

II. The Satisfaction Which Determines the Judgment of Taste Is Disinterested

The satisfaction which we combine with the representation of the existence of an object is called "interest." Such satisfaction always has reference to the faculty of desire, either as its determining ground or as necessarily connected with its determining ground. Now when the question is if a thing is beautiful, we do not want to know whether anything depends or can depend on the existence of the thing, either for myself or for anyone else, but how we judge it by mere observation (intuition or reflection). If anyone asks me if I find that palace beautiful which I see before me, I may answer: I do not like things of that kind which are made merely to be stared at. Or I can answer like that Iroquois sachem, who was pleased in Paris by nothing more than by the cook shops. Or again, after the manner of Rousseau,[3] I may rebuke the vanity of the great who waste the sweat of the people on such superfluous things. In fine, I could easily convince myself that if I found myself on an uninhabited island without the hope of ever again coming among men, and could conjure up just such a splendid building by my mere wish, I should not even give myself the trouble if I had a sufficiently comfortable hut. This may all be admitted and approved, but we are not now talking of this. We wish only to know if this mere representation of the object is accompanied in me with satisfaction, however indifferent I may be as regards the existence of the object of this representation. We easily see that, in saying it is *beautiful* and in showing that I have taste, I am concerned, not with that in which I depend on the existence of the object, but with that which I make out of this representation in myself. Everyone must admit that a judgment about beauty, in which the least interest mingles, is very partial and is not a pure judgment of taste. We must not be in the least prejudiced in favor of the existence of the things, but be quite indifferent in this respect, in order to play the judge in things of taste.

---

[1] [Kant] The definition of "taste" which is laid down here is that it is the faculty of judging of the beautiful. But the analysis of the judgments of taste must show what is required in order to call an object beautiful. The moments to which this judgment has regard in its reflection I have sought in accordance with the guidance of the logical functions of judgment (for in a judgment of taste a reference to the understanding is always involved). I have considered the moment of quality first because the aesthetical judgment upon the beautiful first pays attention to it.

[2] A significant predecessor on the question of taste is Hume (above, page 322).

[3] Jean Jacques Rousseau (1712–1778), French philosopher.

We cannot, however, better elucidate this proposition, which is of capital importance, than by contrasting the pure disinterested[4] satisfaction in judgments of taste with that which is bound up with an interest, especially if we can at the same time be certain that there are no other kinds of interest than those which are to be now specified.

IV. The Satisfaction in the Good Is Bound Up with Interest

Whatever by means of reason pleases through the mere concept is *good.* That which pleases only as a means we call *good for something* (the useful), but that which pleases for itself is *good in itself.* In both there is always involved the concept of a purpose, and consequently the relation of reason to the (at least possible) volition, and thus a satisfaction in the *presence* of an object or an action, i.e. some kind of interest.

In order to find anything good, I must always know what sort of a thing the object ought to be, i.e. I must have a concept of it. But there is no need of this to find a thing beautiful. Flowers, free delineations, outlines intertwined with one another without design and called conventional foliage, have no meaning, depend on no definite concept, and yet they please. The satisfaction in the beautiful must depend on the reflection upon an object, leading to any concept (however indefinite), and it is thus distinguished from the pleasant, which rests entirely upon sensation.

* * *

V. Comparison of the Three Specifically Different Kinds of Satisfaction

The pleasant and the good have both a reference to the faculty of desire, and they bring with them, the former a satisfaction pathologically conditioned (by impulses, stimuli), the latter a pure practical satisfaction which is determined not merely by the representation of the object but also by the represented connection of the subject with the existence of the object. It is not merely the object that pleases, but also its existence. On the other hand, the judgment of taste is merely *contemplative;* i.e., it is a judgment which, indifferent as regards the existence of an object, compares its character with the feeling of pleasure and pain. But this contemplation itself is not directed to concepts; for the judgment of taste is not a cognitive judgment (either theoretical or practical), and thus is not *based* on concepts, nor has its concepts as its *purpose.*

The pleasant, the beautiful, and the good designate then three different relations of representations to the feeling of pleasure and pain, in reference to which we distinguish from one another objects or methods of representing them. And the expressions corresponding to each, by which we mark our complacency in them, are not the same. That which *gratifies* a man is called *pleasant:* that which merely *pleases* him is *beautiful;* that which is *esteemed* or *approved* by him, i.e. that to which he accords an objective worth, is *good.* Pleasantness concerns irrational animals also, but beauty only concerns men, i.e. animal, but still rational, beings—not merely qua rational (e.g. spirits), but qua animal also—and the good concerns every rational being in general. This is a proposition which can only be completely established and explained in the sequel. We may say that, of all these three kinds of satisfaction, that of taste in the beautiful is alone a disinterested and *free* satisfaction; for no interest, either of sense or of reason, here forces our assent. Hence we may say of satisfaction that it is related in the three aforesaid cases to *inclination,* to *favor,* or to *respect.* Now *favor* is the only free satisfaction. An object of inclination and one that is proposed to our desire by a law of reason leave us no freedom in forming for ourselves anywhere an object of pleasure. All interest presupposes or generates a want, and, as the determining ground of assent, it leaves the judgment about the object no longer free.

As regards the interest of inclination in the case of the pleasant, everyone says that hunger is the best sauce, and everything that is eatable is relished by people with a healthy appetite; and thus a satisfaction of this sort shows no choice directed by taste. It is only when the want is appeased that we can distinguish which of many men has or has not taste. In the same way there may be manners (conduct) without virtue, politeness without good will, decorum without modesty, etc. For where the moral law speaks there is no longer, objectively, a free choice as regards what is to be done; and to display taste in its fulfillment (or in judging of another's fulfillment of it) is something quite different from manifesting the moral attitude of thought. For this involves a command and generates a want, while moral taste only plays with the objects of satisfaction, without attaching itself to one of them.

---

[4] [Kant] A judgment upon an object of satisfaction may be quite *disinterested,* but yet very *interesting,* that is, not based upon an interest, but bringing an interest with it; of this kind are all pure moral judgments. Judgments of taste, however, do not in themselves establish any interest. Only in society is it *interesting* to have taste; the reason of this will be shown in the sequel. (Another way of considering this in part is to say that to be disinterested is not to be uninterested. Indeed disinterest implies a certain interest.)

Explanation of the Beautiful Resulting from the First Moment

Taste is the faculty of judging of an object or a method of representing it by an *entirely disinterested* satisfaction or dissatisfaction. The object of such satisfaction is called *beautiful.*[5]

Second Moment

Of the Judgment of Taste, According to Quantity

VI. The Beautiful Is That Which Apart from Concepts Is Represented as the Object of a Universal Satisfaction

This explanation of the beautiful can be derived from the preceding explanation of it as the object of an entirely disinterested satisfaction. For the fact of which everyone is conscious, that the satisfaction is for him quite disinterested, implies in his judgment a ground of satisfaction for all men. For since it does not rest on any inclination of the subject (nor upon any other premeditated interest), but since the person who judges feels himself quite *free* as regards the satisfaction which he attaches to the object, he cannot find the ground of this satisfaction in any private conditions connected with his own subject, and hence it must be regarded as grounded on what he can presuppose in every other person. Consequently he must believe that he has reason for attributing a similar satisfaction to everyone. He will therefore speak of the beautiful as if beauty were a characteristic of the object and the judgment logical (constituting a cognition of the object by means of concepts of it), although it is only aesthetical and involves merely a reference of the representation of the object to the subject. For it has this similarity to a logical judgment that we can presuppose its validity for all men. But this universality cannot arise from concepts; for from concepts there is no transition to the feeling of pleasure or pain (except in pure practical laws, which bring an interest with them such as is not bound up with the pure judgment of taste). Consequently the judgment of taste, accompanied with the consciousness of separation from all interest, must claim validity for every man, without this universality depending on objects. That is, there must be bound up with it a title to subjective universality.

VII. Comparison of the Beautiful with the Pleasant and the Good by Means of the Above Characteristic

As regards the pleasant, everyone is content that his judgment, which he bases upon private feeling and by which he says of an object that it pleases him, should be limited merely to his own person. Thus he is quite contented that if he says, "Canary wine is pleasant," another man may correct his expression and remind him that he ought to say, "It is pleasant *to me.*" And this is the case not only as regards the taste of the tongue, the palate, and the throat, but for whatever is pleasant to anyone's eyes and ears. To one, violet color is soft and lovely; to another, it is washed-out and dead. One man likes the tone of wind instruments, another that of strings. To strive here with the design of reproving as incorrect another man's judgment which is different from our own, as if the judgments were logically opposed, would be folly. As regards the pleasant, therefore, the fundamental proposition is valid: *everyone has his own taste* (the taste of sense).

The case is quite different with the beautiful. It would (on the contrary) be laughable if a man who imagined anything to his own taste thought to justify himself by saying: "This object (the house we see, the coat that person wears, the concert we hear, the poem submitted to our judgment) is beautiful *for me.*" For he must not call it *beautiful* if it merely pleases him. Many things may have for him charm and pleasantness—no one troubles himself at that—but if he gives out anything as beautiful, he supposes in others the same satisfaction; he judges not merely for himself, but for everyone, and speaks of beauty as if it were a property of things. Hence he says "the *thing* is beautiful"; and he does not count on the agreement of others with this his judgment of satisfaction, because he has found this agreement several times before, but he *demands* it of them. He blames them if they judge otherwise and he denies them taste, which he nevertheless requires from them. Here, then, we cannot say that each man has his own particular taste. For this would be as much as to say that there is no taste whatever, i.e. no aesthetical judgment which can make a rightful claim upon everyone's assent.

---

[5] [Bernard] Ueberweg points out (*History of Philosophy* Volume II, page 528, English translation) that Mendelssohn had already called attention to the disinterestedness of our satisfaction in the beautiful. "It appears," says Mendelssohn, "to be a particular mark of the beautiful, that it is contemplated with quiet satisfaction, that it pleases, even though it be not in our possession, and even though we be never so far removed from the desire to put it to our use." But, of course, as Ueberweg remarks, Kant's conception of disinterestedness extends far beyond the idea of merely not desiring to possess the object.

At the same time we find as regards the pleasant that there is an agreement among men in their judgments upon it in regard to which we deny taste to some and attribute it to others, by this not meaning one of our organic senses, but a faculty of judging in respect of the pleasant generally. Thus we say of a man who knows how to entertain his guests with pleasures (of enjoyment for all the senses), so that they are all pleased, "he has taste." But here the universality is only taken comparatively; and there emerge rules which are only *general* (like all empirical ones), and not *universal,* which latter the judgment of taste upon the beautiful undertakes or lays claim to. It is a judgment in reference to sociability, so far as this rests on empirical rules. In respect of the good it is true that judgments make rightful claim to validity for everyone; but the good is represented only *by means of a concept* as the object of a universal satisfaction, which is the case neither with the pleasant nor with the beautiful.

* * *

VIII. The Universality of the Satisfaction Is Represented in a Judgment of Taste Only as Subjective

This particular determination of the universality of an aesthetical judgment, which is to be met with in a judgment of taste, is noteworthy, not indeed for the logician, but for the transcendental philosopher. It requires no small trouble to discover its origin, but we thus detect a property of our cognitive faculty which without this analysis would remain unknown.

First, we must be fully convinced of the fact that in a judgment of taste (about the beautiful) the satisfaction in the object is imputed to *everyone,* without being based on a concept (for then it would be the good). Further, this claim to universal validity so essentially belongs to a judgment by which we describe anything as *beautiful* that, if this were not thought in it, it would never come into our thoughts to use the expression at all, but everything which pleases without a concept would be counted as pleasant. In respect of the latter, everyone has his own opinion; and no one assumes in another agreement with his judgment of taste, which is always the case in a judgment of taste about beauty. I may call the first the taste of sense, the second the taste of reflection, so far as the first lays down mere private judgments and the second judgments supposed to be generally valid (public), but in both cases aesthetical (not practical) judgments about an object merely in respect of the relation of its representation to the feeling of pleasure and pain. Now here is something strange. As regards the taste of sense, not only does experience show that its judgment (of pleasure or pain connected with anything) is not valid universally, but everyone is content not to impute agreement with it to others (although actually there is often found a very extended concurrence in these judgments). On the other hand, the taste of reflection has its claim to the universal validity of its judgments (about the beautiful) rejected often enough, as experience teaches, although it may find it possible (as it actually does) to represent judgments which can demand this universal agreement. In fact it imputes this to everyone for each of its judgments of taste, without the persons that judge disputing as to the possibility of such a claim, although in particular cases they cannot agree as to the correct application of this faculty.

Here we must, in the first place, remark that a universality which does not rest on concepts of objects (not even on empirical ones) is not logical but aesthetical; i.e. it involves no objective quantity of the judgment, but only that which is subjective. For this I use the expression *general validity,* which signifies the validity of the reference of a representation, not to the cognitive faculty, but to the feeling of pleasure and pain for every subject. (We can avail ourselves also of the same expression for the logical quantity of the judgment, if only we prefix "objective" to "universal validity," to distinguish it from that which is merely subjective and aesthetical.)

A judgment with *objective universal validity* is also always valid subjectively; i.e. if the judgment holds for everything contained under a given concept, it holds also for everyone who represents an object by means of this concept. But from a *subjective universal validity,* i.e. aesthetical and resting on no concept, we cannot infer that which is logical because that kind of judgment does not extend to the object. But, therefore, the aesthetical universality which is ascribed to a judgment must be of a particular kind, because it does not unite the predicate of beauty with the concept of the object, considered in its whole logical sphere, and yet extends it to the whole sphere of judging persons.

In respect of logical quantity, all judgments of taste are *singular* judgments. For because I must refer the object immediately to my feeling of pleasure and pain, and that not by means of concepts, they cannot have the quantity of objective generally valid judgments. Nevertheless, if the singular representation of the object of the judgment of taste, in accordance with the conditions determining the latter, were transformed by comparison into a concept, a logically universal judgment could result therefrom. E.g., I describe by a judgment of taste the rose that I see as beautiful. But the judgment which results from the comparison of several singular judgments, "Roses in general are beautiful," is no longer described simply as aesthetical, but as a logical judgment based on an aesthetical one. Again the judgment, "The rose is pleasant" (to use) is, although aesthetical and singular, not a judgment of taste but of sense. It is distinguished from the former by the fact that the judgment of taste carries with it an *aesthetic quantity* of universality, i.e. of validity for everyone, which cannot be found in a judgment about the pleasant. It is only judgments about the good which, although they also determine satisfaction in an object, have logical and not merely aesthetical universality, for they are valid of the object as cognitive of it, and thus are valid for everyone.

If we judge objects merely according to concepts, then all representation of beauty is lost. Thus there can be no rule according to which anyone is to be forced to recognize anything as beautiful. We cannot press [upon others] by the aid of any reasons or fundamental propositions our judgment that a coat, a house, or a flower is beautiful. People wish to submit the object to their own eyes, as if the satisfaction in it depended on sensation; and yet, if we then call the object beautiful, we believe that we speak with a universal voice, and we claim the assent of everyone, although on the contrary all private sensation can only decide for the observer himself and his satisfaction.

We may see now that in the judgment of taste nothing is postulated but such a *universal voice,* in respect of the satisfaction without the intervention of concepts, and thus the *possibility* of an aesthetical judgment that can, at the same time, be regarded as valid for everyone. The judgment of taste itself does not *postulate* the agreement of everyone (for that can only be done by a logically universal judgment because it can adduce reasons); it only *imputes* this agreement to everyone, as a case of the rule in respect of which it expects, not confirmation by concepts, but assent from others. The universal voice is, therefore, only an idea (we do not yet inquire upon what it rests). It may be uncertain whether or not the man who believes that he is laying down a judgment of taste is, as a matter of fact, judging in conformity with that idea; but that he refers his judgment thereto, and consequently that it is intended to be a judgment of taste, he announces by the expression "beauty." He can be quite certain of this for himself by the mere consciousness of the separating off everything belonging to the pleasant and the good from the satisfaction which is left; and this is all for which he promises himself the agreement of everyone—a claim which would be justifiable under these conditions, provided only he did not often make mistakes, and thus lay down an erroneous judgment of taste.

IX. Investigation of the Question Whether in the Judgment of Taste the Feeling of Pleasure Precedes or Follows the Judging of the Object

The solution of this question is the key to the critique of taste, and so is worthy of all attention.

If the pleasure in the given object precedes, and it is only its universal communicability that is to be acknowledged in the judgment of taste about the representation of the object, there would be a contradiction. For such pleasure would be nothing different from the mere pleasantness in the sensation, and so in accordance with its nature could have only private validity, because it is immediately dependent on the representation through which the object *is given.*

Hence it is the universal capability of communication of the mental state in the given representation which, as the subjective condition of the judgment of taste, must be fundamental and must have the pleasure in the object as its consequent. But nothing can be universally communicated except cognition and representation, so far as it belongs to cognition. For it is only thus that this latter can be objective, and only through this has it a universal point of reference, with which the representative power of everyone is compelled to harmonize. If the determining ground of our judgment as to this universal communicability of the representation is to be merely subjective, i.e. is conceived independently of any concept of the object, it can be nothing else than the state of mind, which is to be met with in the relation of our representative powers to each other, so far as they refer a given representation to *cognition in general.*

The cognitive powers, which are involved by this representation, are here in free play, because no definite concept limits them to a definite rule of cognition. Hence the state of mind in this representation must be a feeling of the free play of the representative powers in a given representation with reference to a cognition in general. Now a representation by which an object is given that is to become a cognition in general requires *imagination* for the gathering together the manifold of intuition, and *understanding* for the unity of the concept uniting the representations. This state of *free play* of the cognitive faculties in a representation by which an object is given must be universally communicable, because cognition, as the determination of the object with which given representations (in whatever subject) are to agree, is the only kind of representation which is valid for everyone.

The subjective universal communicability of the mode of representation in a judgment of taste, since it is to be possible without presupposing a definite concept, can refer to nothing else than the state of mind in the free play of the imagination and the understanding (so far as they agree with each other, as is requisite for *cognition in general*). We are conscious that this subjective relation, suitable for cognition in general, must be valid for everyone, and thus must be universally communicable, just as if it were a definite cognition, resting always on that relation as its subjective condition.

This merely subjective (aesthetical) judging of the object, or of the representation by which it is given, precedes the pleasure in the same and is the ground of this pleasure in the harmony of the cognitive faculties; but on that universality of the subjective conditions for judging of objects is alone based the universal subjective validity of the satisfaction bound up by us with the representation of the object that we call beautiful.

That the power of communicating one's state of mind, even though only in respect of the cognitive faculties, carries a pleasure with it, this we can easily show from the natural propension of man toward sociability (empirical and psychological). But this is not enough for our design. The pleasure that we feel is, in a judgment of taste, necessarily imputed by us to everyone else, as if, when we call a thing beautiful, it is to be regarded as a characteristic of the object which is determined in it according to concepts, though beauty, without a reference to the feeling of the subject, is nothing by itself. But we must reserve the examination of this question until we have answered that other—if and how aesthetical judgments are possible *a priori.*

We now occupy ourselves with the easier question, in what way we are conscious of a mutual subjective harmony of the cognitive powers with one another in the judgment of taste—is it aesthetically by mere internal sense and sensation, or is it intellectually by the consciousness of our designed activity, by which we bring them into play?

If the given representation which occasions the judgment of taste were a concept uniting understanding and imagination in the judging of the object, into a cognition of the object, the consciousness of this relation would be intellectual (as in the objective schematism of the judgment of which the *Critique*[6] treats). But then the judgment would not be laid down in reference to pleasure and pain, and consequently would not be a judgment of taste. But the judgment of taste, independently of concepts, determines the object in respect of satisfaction and of the predicate of beauty. Therefore that subjective unity of relation can only make itself known by means of sensation. The excitement of both faculties (imagination and understanding) to indeterminate but yet, through the stimulus of the given sensation, harmonious activity, viz. that which belongs to cognition in general, is the sensation whose universal communicability is postulated by the judgment of taste. An objective relation can only be thought, but yet, so far as it is subjective according to its conditions, can be felt in its effect on the mind; and, of a relation based on no concept (like the relation of the representative powers to a cognitive faculty in general), no other consciousness is possible than that through the sensation of the effect, which consists in the more lively play of both mental powers (the imagination and the understanding) when animated by mutual agreement. A representation which, as individual and apart from comparison with others, yet has an agreement with the conditions of universality which it is the business of the understanding to supply, brings the cognitive faculties into that proportionate accord which we require for all cognition, and so regard as holding for everyone who is determined to judge by means of understanding and sense in combination (i.e. for every man).

Explanation of the Beautiful Resulting from the Second Moment

The *beautiful* is that which pleases universally without requiring a concept.

Third Moment

Of Judgments of Taste, According to the Relation of the Purposes Which Are Brought Into Consideration in Them

* * *

XI. The Judgment of Taste Has Nothing at Its Basis but the Form of the Purposiveness of an Object (or of Its Mode of Representation)

Every purpose, if it be regarded as a ground of satisfaction, always carries with it an interest—as the determining ground of the judgment—about the object of pleasure. Therefore no subjective purpose can lie at the basis of the judgment of taste. But also the judgment of taste can be determined by no representation of an objective purpose, i.e. of the possibility of the object itself in accordance with principles of purposive combination, and consequently by no concept of the good, because it is an aesthetical and not a cognitive judgment. It therefore has to do with no *concept* of the character and internal or external possibility of the object by means of this or that cause, but merely with the relation of the representative powers to one another, so far as they are determined by a representation.

Now this relation in the determination of an object as beautiful is bound up with the feeling of pleasure, which is declared by the judgment of taste to be valid for everyone; hence a pleasantness merely accompanying the representation can as little contain the determining ground of the judgment as the representation of the perfection of the object and the concept of the good can. Therefore it can be nothing else than the subjective purposiveness in the representation of an object without any purpose (either objective or subjective), and thus it is the mere form of purposiveness in the representation by which an object is *given* to us, so far as we are conscious of it, which constitutes the satisfaction that we without a concept judge to be universally communicable; and, consequently, this is the determining ground of the judgment of taste.

---

[6] [Bernard] *Critique of Rure Reason,* "Analytic," Book II, Chapter 1.

* * *

XIII. The Pure Judgment of Taste Is Independent of Charm and Emotion

Every interest spoils the judgment of taste and takes from its impartiality, especially if the purposiveness is not, as with the interest of reason, placed before the feeling of pleasure but grounded on it. This last always happens in an aesthetical judgment upon anything, so far as it gratifies or grieves us. Hence judgments so affected can lay no claim at all to a universally valid satisfaction, or at least so much the less claim, in proportion as there are sensations of this sort among the determining grounds of taste. That taste is always barbaric which needs a mixture of *charms* and *emotions* in order that there may be satisfaction, and still more so if it make these the measure of its assent.

Nevertheless charms are often not only taken account of in the case of beauty (which properly speaking ought merely to be concerned with form) as contributory to the aesthetical universal satisfaction, but they are passed off as in themselves beauties; and thus the matter of satisfaction is substituted for the form. This misconception, however, which like so many others, has something true at its basis, may be removed by a careful determination of these concepts.

A judgment of taste on which charm and emotion have no influence (although they may be bound up with the satisfaction in the beautiful)—which therefore has as its determining ground merely the purposiveness of the form—is a *pure judgment of taste.*

XIV. Elucidation by Means of Examples

Aesthetical judgments can be divided just like theoretical (logical) judgments into empirical and pure. The first assert pleasantness or unpleasantness; the second assert the beauty of an object or of the manner of representing it. The former are judgments of sense (material aesthetical judgments); the latter as formal are alone strictly judgments of taste.

A judgment of taste is therefore pure only so far as no merely empirical satisfaction is mingled with its determining ground. But this always happens if charm or emotion have any share in the judgment by which anything is to be described as beautiful.

Now here many objections present themselves which, fallaciously, put forward charm not merely as a necessary ingredient of beauty, but as alone sufficient to justify a thing's being called beautiful. A mere color, e.g. the green of a grass plot, a mere tone (as distinguished from sound and noise), like that of a violin, are by most people described as beautiful in themselves, although both seem to have at their basis merely the matter of representations, viz. simply sensation, and therefore only deserve to be called pleasant. But we must at the same time remark that the sensations of colors and of tone have a right to be regarded as beautiful only in so far as they are *pure.* This is a determination which concerns their form and is the only element of these representations which admits with certainty of universal communicability; for we cannot assume that the quality of sensations is the same in all subjects, and we can hardly say that the pleasantness of one color or the tone of one musical instrument is judged preferable to that of another in the same way by everyone.

If we assume with Euler[7] that colors are isochronous vibrations *(pulsus)* of the ether, as sounds are of the air in a state of disturbance, and—what is the most important—that the mind not only perceives by sense the effect of these in exciting the organ, but also perceives by reflection the regular play of impressions (and thus the form of the combination of different representations)—which I very much doubt—then colors and tone cannot be reckoned as mere sensations, but as the formal determination of the unity of a manifold of sensations, and thus as beauties.

But "pure" in a simple mode of sensation means that its uniformity is troubled and interrupted by no foreign sensation, and it belongs merely to the form; because here we can abstract from the quality of that mode of sensation (abstract from the colors and tone, if any, which it represents). Hence all simple colors, so far as they are pure, are regarded as beautiful; composite colors have not this advantage because, as they are not simple, we have no standard for judging whether they should be called pure or not.

---

[7] Leonhard Euler (1707–1783), Swiss mathematician and physicist.

But as regards the beauty attributed to the object on account of its form, to suppose it to be capable of augmentation through the charm of the object is a common error and one very prejudicial to genuine, uncorrupted, well-founded taste. We can doubtless add these charms to beauty, in order to interest the mind by the representation of the object, apart from the bare satisfaction received, and thus they may serve as a recommendation of taste and its cultivation, especially when it is yet crude and unexercised. But they actually do injury to the judgment of taste if they draw attention to themselves as the grounds for judging of beauty. So far are they from adding to beauty that they must only be admitted by indulgence as aliens, and provided always that they do not disturb the beautiful form in cases when taste is yet weak and unexercised.

In painting, sculpture, and in all the formative arts—in architecture and horticulture, so far as they are beautiful arts—the *delineation* is the essential thing; and here it is not what gratifies in sensation but what pleases by means of its form that is fundamental for taste. The colors which light up the sketch belong to the charm; they may indeed enliven the object for sensation, but they cannot make it worthy of contemplation and beautiful. In most cases they are rather limited by the requirements of the beautiful form, and even where charm is permissible it is ennobled solely by this.

Every form of the objects of sense (both of external sense and also mediately of internal) is either *figure* or *play*. In the latter case it is either play of figures (in space, viz. pantomime and dancing) or the mere play of sensations (in time). The *charm* of colors or of the pleasant tones of an instrument may be added, but the *delineation* in the first case and the composition in the second constitute the proper object of the pure judgment of taste. To say that the purity of colors and of tones, or their variety and contrast, seem to add to beauty does not mean that they supply a homogeneous addition to our satisfaction in the form because they are pleasant in themselves; but they do so because they make the form more exactly, definitely, and completely, intuitible, and besides, by their charm excite the representation, while they awaken and fix our attention on the object itself.

Even what we call "ornaments" *[parerga]*, i.e. those things which do not belong to the complete representation of the object internally as elements, but only externally as complements, and which augment the satisfaction of taste, do so only by their forms; as, for example, the frames of pictures or the draperies of statues or the colonnades of palaces. But if the ornament does not itself consist in beautiful form, and if it is used as a golden frame is used, merely to recommend the painting by its *charm*, it is then called *finery* and injures genuine beauty.

Emotion, that is, a sensation in which pleasantness is produced by means of a momentary checking and a consequent more powerful outflow of the vital force, does not belong at all to beauty. But sublimity [with which the feeling of emotion is bound up] requires a different standard of judgment from that which is at the foundation of taste; and thus a pure judgment of taste has for its determining ground neither charm nor emotion—in a word, no sensation as the material of aesthetical judgment.

XV. The Judgment of Taste Is Quite Independent of the Concept of Perfection

Objective purposiveness can only be cognized by means of the reference of the manifold to a definite purpose, and therefore only through a concept. From this alone it is plain that the beautiful, the judging of which has at its basis a merely formal purposiveness, i.e. a purposiveness without purpose, is quite independent of the concept of the good, because the latter presupposes an objective purposiveness, i.e. the reference of the object to a definite purpose.

Objective purposiveness is either external, i.e. the *utility*, or internal, i.e. the *perfection* of the object. That the satisfaction in an object, on account of which we call it beautiful, cannot rest on the representation of its utility is sufficiently obvious from the two preceding sections; because in that case it would not be an immediate satisfaction in the object, which is the essential condition of a judgment about beauty. But objective internal purposiveness, i.e. perfection, comes nearer to the predicate of beauty; and it has been regarded by celebrated philosophers[8] as the same as beauty, with the proviso, *if it is thought in a confused way*. It is of the greatest importance in a critique of taste to decide whether beauty can thus actually be resolved into the concept of perfection.

To judge of objective purposiveness we always need, not only the concept of a purpose, but (if that purposiveness is not to be external utility but internal) the concept of an internal purpose which shall contain the ground of the internal possibility of the object. Now as a purpose in general is that whose *concept* can be regarded as the ground of the possibility of the object itself; so, in order to represent objective purposiveness in a thing, the concept of *what sort of thing it is to be* must come first. The agreement of the manifold in it with this concept (which furnishes the rule for combining the manifold) is the *qualitative perfection* of the thing. Quite different from this is *quantitative* perfection, the completeness of a thing after its kind, which is a mere concept of magnitude (of totality).[9] In this *what the thing ought to be* is conceived as already determined, and it is only asked if it has *all* its requisites. The formal element in the representation of a thing, i.e. the agreement of the manifold with a unity (it being undetermined what this ought to be), gives to cognition no objective purposiveness whatever. For since abstraction is made of this unity as *purpose* (what the thing ought to be), nothing remains but the subjective purposeness of the representations in the mind of the intuiting subject. And this, although it furnishes a certain purposiveness of the representative state of the subject, and so a facility of apprehending a given form by the imagination, yet furnishes no perfection of an object, since the object is not here conceived by means of the concept of a purpose. For example, if in a forest I come across a plot of sward around which trees stand in a circle and do not then represent to myself a purpose, viz that it is intended to serve for country dances, not the least concept of perfection is furnished by the mere form. But to represent to oneself a formal *objective* purposiveness without purpose, i.e. the mere form of a *perfection* (without any matter and without the *concept* of that with which it is accordant, even if it were merely the idea of conformity to law in general), is a veritable contradiction.

---

[8] [Bernard] Kant probably refers here to [Alexander] Baumgarten (1714–1762), who was the first writer to give the name of aesthetics to the philosophy of taste. He defined beauty as "perfection apprehended through the senses." Kant is said to have used as a textbook at lectures a work by Meier, a pupil of Baumgarten's, on the subject.

Now the judgment of taste is an aesthetical judgment, i.e. such as rests on subjective grounds, the determining ground of which cannot be a concept, and consequently cannot be the concept of a definite purpose. Therefore by means of beauty, regarded as a formal subjective purposiveness, there is in no way thought a perfection of the object, as a purposiveness alleged to be formal but which is yet objective. And thus to distinguish between the concepts of the beautiful and the good as if they were only different in logical form, the first being a confused, the second a clear concept of perfection, but identical in content and origin, is quite fallacious. For then there would be no *specific* difference between them, but a judgment of taste would be as much a cognitive judgment as the judgment by which a thing is described as good; just as when the ordinary man says that fraud is unjust he bases his judgment on confused grounds, while the philosopher bases it on clear grounds, but both on identical principles of reason. I have already, however, said that an aesthetical judgment is unique of its kind and gives absolutely no cognition (not even a confused cognition) of the object; this is only supplied by a logical judgment. On the contrary, it simply refers the representation, by which an object is given, to the subject, and brings to our notice no characteristic of the object, but only the purposive form in the determination of the representative powers which are occupying themselves therewith. The judgment is called aesthetical just because its determining ground is not a concept, but the feeling (of internal sense) of that harmony in the play of the mental powers, so far as it can be felt in sensation. On the other hand, if we wish to call confused concepts and the objective judgment based on them aesthetical, we will have an understanding judging sensibly or a sense representing its objects by means of concepts both of which are contradictory. The faculty of concepts, be they confused or clear, is the understanding; and although understanding has to do with the judgment of taste as an aesthetical judgment (as it has with all judgments), yet it has to do with it, not as a faculty by which an object is cognized, but as the faculty which determines the judgment and its representation (without any concept) in accordance with its relation to the subject and the subject's internal feeling, in so far as this judgment may be possible in accordance with a universal rule.

XVI. The Judgment of Taste, by Which an Object Is Declared to Be Beautiful Under the Condition of a Definite Concept, Is Not Pure

There are two kinds of beauty: free beauty *(pulchritudo vaga)*, or merely dependent beauty *(pulchritudo adhaerens)*. The first presupposes no concept of what the object ought to be; the second does presuppose such a concept and the perfection of the object in accordance therewith. The first is called the (self-subsistent) beauty of this or that thing; the second, as dependent upon a concept (conditioned beauty), is ascribed to objects which come under the concept of a particular purpose.

Flowers are free natural beauties. Hardly anyone but a botanist knows what sort of a thing a flower ought to be; and even he, though recognizing in the flower the reproductive organ of the plant, pays no regard to this natural purpose if he is passing judgment on the flower by taste. There is, then, at the basis of this judgment no perfection of any kind, no internal purposiveness, to which the collection of the manifold is referred. Many birds (such as the parrot, the hummingbird, the bird of paradise) and many sea shells are beauties, in themselves, which do not belong to any object determined in respect of its purpose by concepts, but please freely and in themselves. So also delineations *à la grecque,* foliage for borders or wall papers, mean nothing in themselves; they represent nothing—no object under a definite concept—and are free beauties. We can refer to the same class what are called in music fantasies (i.e. pieces without any theme), and in fact all music without words.

---

[9] [Bernard] Cf. Preface to the *Metaphysical Elements of Ethics*, p. v: "The word *perfection* is liable to many misconceptions. It is sometimes understood as a concept belonging to transcendental philosophy; viz. the concept of the *totality* of the manifold, which, taken together, constitutes a thing; sometimes, again, it is understood as belonging to teleology, so that it signifies the agreement of the characteristics of a thing with a *purpose*. Perfection in the former sense might be called *quantitative* (material), in the latter *qualitative* (formal) perfection.

In the judging of a free beauty (according to the mere form), the judgment of taste is pure. There is presupposed no concept of any purpose which the manifold of the given object is to serve, and which therefore is to be represented in it. By such a concept the freedom of the imagination which disports itself in the contemplation of the figure would be only limited.

But human beauty (i.e. of a man, a woman, or a child), the beauty of a horse, or a building (be it church, palace, arsenal, or summer house), presupposes a concept of the purpose which determines what the thing is to be, and consequently a concept of its perfection; it is therefore adherent beauty. Now as the combination of the pleasant (in sensation) with beauty, which properly is only concerned with form, is a hindrance to the purity of the judgment of taste, so also is its purity injured by the combination with beauty of the good (viz. that manifold which is good for the thing itself in accordance with its purpose).

We could add much to a building which would immediately please the eye if only it were not to be a church. We could adorn a figure with all kinds of spirals and light but regular lines, as the New Zealanders do with their tattooing, if only it were not the figure of a human being. And again this could have much finer features and a more pleasing and gentle cast of countenance provided it were not intended to represent a man, much less a warrior.

Now the satisfaction in the manifold of a thing in reference to the internal purpose which determines its possibility is a satisfaction grounded on a concept; but the satisfaction in beauty is such as presupposes no concept, but is immediately bound up with the representation through which the object is given (not through which it is thought). If now the judgment of taste in respect of the beauty of a thing is made dependent on the purpose in its manifold, like a judgment of reason, and thus limited, it is no longer a free and pure judgment of taste.

It is true that taste gains by this combination of aesthetical with intellectual satisfaction, inasmuch as it becomes fixed; and though it is not universal, yet in respect to certain purposively determined objects it becomes possible to prescribe rules for it. These, however, are not rules of taste, but merely rules for the unification of taste with reason, i.e. of the beautiful with the good, by which the former becomes available as an instrument of design in respect of the latter. Thus the tone of mind which is self-maintaining and of subjective universal validity is subordinated to the way of thinking which can be maintained only by painful resolve, but is of objective universal validity. Properly speaking, however, perfection gains nothing by beauty, or beauty by perfection; but when we compare the representation by which an object is given to us with the object (as regards what it ought to be) by means of a concept, we cannot avoid considering along with it the sensation in the subject. And thus when both states of mind are in harmony our *whole faculty* of representative power gains.

A judgment of taste, then, in respect of an object with a definite internal purpose, can only be pure if either the person judging has no concept of this purpose or else abstracts from it in his judgment. Such a person, although forming an accurate judgment of taste in judging of the object as free beauty, would yet by another who considers the beauty in it only as a dependent attribute (who looks to the purpose of the object) be blamed and accused of false taste, although both are right in their own way—the one in reference to what he has before his eyes, the other in reference to what he has in his thought. By means of this distinction we can settle many disputes about beauty between judges of taste, by showing that the one is speaking of free, the other of dependent, beauty—that the first is making a pure, the second an applied, judgment of taste.

XVII. Of the Ideal of Beauty

There can be no objective rule of taste which shall determine by means of concepts what is beautiful. For every judgment from this source is aesthetical; i.e. the feeling of the subject, and not a concept of the object, is its determining ground. To seek for a principle of taste which shall furnish, by means of definite concepts, a universal criterion of the beautiful is fruitless trouble, because what is sought is impossible and self-contradictory. The universal communicability of sensation (satisfaction or dissatisfaction) without the aid of a concept—the agreement, as far as is possible, of all times and peoples as regards this feeling in the representation of certain objects—this is the empirical criterion, although weak and hardly sufficing for probability, of the derivation of a taste, thus confirmed by examples, from the deep-lying general grounds of agreement in judging of the forms under which objects are given.

Hence we consider some products of taste as *exemplary.* Not that taste can be acquired by imitating others, for it must be an original faculty. He who imitates a model shows no doubt, in so far as he attains to it, skill; but only shows taste in so far as he can judge of this model itself.[10] It follows from hence that the highest model, the archetype of taste, is a mere idea, which everyone must produce in himself and according to which he must judge every object of taste, every example of judgment by taste, and even the taste of everyone. *Idea* properly means a rational concept, and *ideal* the representation of an individual being, regarded as adequate to an idea.[11] Hence that archetype of taste, which certainly rests on the indeterminate idea that reason has of a maximum, but which cannot be represented by concepts but only in an individual presentation, is better called the ideal of the beautiful. Although we are not in possession of this, we yet strive to produce it in ourselves. But it can only be an ideal of the imagination, because it rests on a presentation and not on concepts, and the imagination is the faculty of presentation. How do we arrive at such an ideal of beauty? A priori, or empirically? Moreover, what species of the beautiful is susceptible of an ideal?

First, it is well to remark that the beauty for which an ideal is to be sought cannot be *vague* beauty, but is *fixed* by a concept of objective purposiveness; and thus it cannot appertain to the object of a quite pure judgment of taste, but to that of a judgment of taste which is in part intellectual. That is, in whatever grounds of judgment an ideal is to be found, an idea of reason in accordance with definite concepts must lie at its basis, which determines a priori the purpose on which the internal possibility of the object rests. An ideal of beautiful flowers, of a beautiful piece of furniture, of a beautiful view, is inconceivable. But neither can an ideal be represented of a beauty dependent on definite purposes, e.g. of a beautiful dwelling house, a beautiful tree, a beautiful garden, etc.; presumably because their purpose is not sufficiently determined and fixed by the concept, and thus the purposiveness is nearly as free as in the case of *vague* beauty. The only being which has the purpose of its existence in itself is *man,* who can determine his purposes by reason; or, where he must receive them from external perception, yet can compare them with essential and universal purposes and can judge this their accordance aesthetically. This *man* is, then, alone of all objects in the world, susceptible of an ideal of *beauty,* as it is only *humanity* in his person, as an intelligence, that is susceptible of the ideal of *perfection.*

But there are here two elements. *First,* there is the aesthetical *normal idea,* which is an individual intuition (of the imagination), representing the standard of our judgment upon man as a thing belonging to a particular animal species. *Secondly,* there is the *rational idea* which makes the purposes of humanity, so far as they cannot be sensibly represented the principle for judging of a figure through which, as their phenomenal effect, those purposes are revealed. The normal idea of the figure of an animal of a particular race must take its elements from experience. But the greatest purposiveness in the construction of the figure that would be available for the universal standard of aesthetical judgment upon each individual of this species—the image which is as it were designedly at the basis of nature's technique, to which only the whole race and not any isolated individual is adequate—this lies merely in the idea of the judging subject. And this, with its proportions as an aesthetical idea, can be completely presented *in concreto* in a model. In order to make intelligible in some measure (for who can extract her whole secret from nature?) how this comes to pass, we shall attempt a psychological explanation.

We must remark that, in a way quite incomprehensible by us, the imagination cannot only recall on occasion the signs for concepts long past, but can also reproduce the image of the figure of the object out of an unspeakable number of objects of different kinds or even of the same kind. Further, if the mind is concerned with comparisons, the imagination can, in all probability, actually, though unconsciously, let one image glide into another; and thus, by the concurrence of several of the same kind, come by an average, which serves as the common measure of all. Everyone has seen a thousand full-grown men. Now if you wish to judge of their normal size, estimating it by means of comparison, the imagination (as I think) allows a great number of images (perhaps the whole thousand) to fall on one another. If I am allowed to apply here the analogy of optical presentation, it is in the space where most of them are combined and inside the contour, where the place is illuminated with the most vivid colors, that the *average size* is cognizable, which, both in height and breadth, is equally far removed from the extreme bounds of the greatest and smallest stature. And this is the stature of a beautiful man. (We could arrive at the same thing mechanically by adding together all thousand magnitudes, heights, breadths, and thicknesses, and dividing the sum by a thousand. But the imagination does this by means of a dynamical effect, which arises from the various impressions of such figures on the organ of internal sense.) If now, in a similar way, for this average man we seek the average head, for this head the average nose, etc., such figure is at the basis of the normal idea in the country where the comparison is instituted. Thus necessarily under these empirical conditions a Negro must have a different normal idea of the beauty of the human figure from a white man, a Chinaman a different normal idea from a European, etc. And the same is the case with the model of a beautiful horse or dog (of a certain breed). This *normal idea* is not derived from proportions gotten from experience [and regarded] *as definite rules,* but in accordance with it rules for judging become in the first instance possible. It is the image for the whole race, which floats among all the variously different intuitions of individuals, which nature takes as archetype in her productions of the same species, but which appears not to be fully reached in an individual case. It is by no means the whole *archetype of beauty* in the race, but only the form constituting the indispensable condition of all beauty, and thus merely *correctness* in the mental presentation of the race. It is, like the celebrated *Doryphorus* of Polycletus,[12] the *rule* (Myron's *Cow*[13] might also be used thus for its kind). It can therefore contain nothing specifically characteristic, for otherwise it would not be the *normal idea* for the race. Its presentation pleases, not by its beauty, but merely because it contradicts no condition, under which alone a thing of this kind can be beautiful. The presentation is merely correct.[14]

---

[10] [Kant] Models of taste as regards the arts of speech must be composed in a dead and learned language. The first in order that they may not suffer that change which inevitably comes over living languages, in which noble expressions become flat, common ones antiquated, and newly created ones have only a short circulation. The second because learned languages have a grammar which is subject to no wanton change of fashion, but the rules of which are preserved unchanged.

[11] [Bernard] This distinction between an *idea* and an *ideal,* as also the further contrast between ideals of the reason and ideals of the imagination, had already been given by Kant in the *Critique of Pure Reason,* "Dialectic," Book II, Chapter 3, Section 1.

We must yet distinguish the *normal idea* of the beautiful from the *ideal,* which latter, on grounds already alleged, we can only expect in the *human* figure. In this the ideal consists in the expression of the *moral,* without which the object would not please universally and thus positively (not merely negatively in an accurate presentation). The visible expression of moral ideas that rule men inwardly can indeed only be gotten from experience; but to make its connection with all which our reason unites with the morally good in the idea of the highest purposiveness—goodness of heart, purity, strength, peace, etc.—visible as it were in bodily manifestation (as the effect of that which is internal) requires a union of pure ideas of reason with great imaginative power even in him who wishes to judge of it, still more in him who wishes to present it. The correctness of such an ideal of beauty is shown by its permitting no sensible charm to mingle with the satisfaction in the object, and yet allowing us to take a great interest therein. This shows that a judgment in accordance with such a standard can never be purely aesthetical, and that a judgment in accordance with an ideal of beauty is not a mere judgment of taste.

Explanation of the Beautiful Derived from This Third Moment

Beauty is the form of the *purposiveness* of an object, so far as this is perceived in it *without any representation of a purpose.*[15]

Fourth Moment

Of the Judgment of Taste, According to the Modality of the Satisfaction in the Object

XVIII. What the Modality in a Judgment of Taste Is

I can say of every representation that it is at least *possible* that (as a cognition) it should be bound up with a pleasure. Of a representation that I call *pleasant* I say that it *actually* excites pleasure in me. But the *beautiful* we think as having a *necessary* reference to satisfaction. Now this necessity is of a peculiar kind. It is not a theoretical objective necessity, in which case it would be cognized *a priori* that everyone *will feel* this satisfaction in the object called beautiful by me. It is not a practical necessity, in which case, by concepts of a pure rational will serving as a rule for freely acting beings, the satisfaction is the necessary result of an objective law and only indicates that we absolutely (without any further design) ought to act in a certain way. But the necessity which is thought in an aesthetical judgment can only be called exemplary, i.e. a necessity of the assent of *all* to a judgment which is regarded as the example of a universal rule that we cannot state. Since an aesthetical judgment is not an objective cognitive judgment, this necessity cannot be derived from definite concepts and is therefore not apodictic. Still less can it be inferred from the universality of experience (of a complete agreement of judgments as to the beauty of a certain object). For not only would experience hardly furnish sufficiently numerous vouchers for this, but also, on empirical judgments, we can base no concept of the necessity of these judgments.

---

[12] [Bernard] Polycletus of Argos flourished about 430 B.C. His statue of the *Spearbearer* (Doryphorus) afterward became known as the *Canon,* because in it the artist was supposed to have embodied a perfect representation of the ideal of the human figure.

[13] [Bernard] This was a celebrated statue executed by Myron, a Greek sculptor contemporary with Polycletus.

[14] [Kant] It will be found that a perfectly regular countenance, such as a painter might wish to have for a model, ordinarily tells us nothing because it contains nothing characteristic, and therefore rather expresses the idea of the race than the specific traits of a person. The exaggeration of a characteristic of this kind, that is, such as does violence to the normal idea (the purposiveness of the race) is called *caricature.* Experience also shows that these quite regular countenances commonly indicate internally only a mediocre man, presumably (if it may be assumed that external nature expresses the proportions of internal) because, if no mental disposition exceeds that proportion which is requisite in order to constitute a man free from faults, nothing can be expected of what is called *genius,* in which nature seems to depart from the ordinary relations of mental powers on behalf of some special one.

[15] [Kant] It might be objected to this explanation that there are things in which we see a purposive form without cognizing any purpose in them, like the stone implements often gotten from old sepulchral tumuli with a hole in them, as if for a handle. These, although they plainly indicate by their shape a purposiveness of which we do not know the purpose, are nevertheless not described as beautiful. But if we regard a thing as a work of art, that is enough to make us admit that its shape has reference to some design and definite purpose. And hence there is no immediate satisfaction in the contemplation of it. On the other hand a flower, for instance a tulip, is regarded as beautiful because in perceiving it we find a certain purposiveness which, in our judgment, is referred to no purpose at all.

XIX. The Subjective Necessity, Which We Ascribe to the Judgment of Taste, Is Conditioned

The judgment of taste requires the agreement of everyone, and he who describes anything as beautiful claims that everyone *ought* to give his approval to the object in question and also describe it as beautiful. The *ought* in the aesthetical judgment is therefore pronounced in accordance with all the data which are required for judging, and yet is only conditioned. We ask for the agreement of everyone else, because we have for it a ground that is common to all; and we could count on this agreement, provided we were always sure that the case was correctly subsumed under that ground as rule of assent.

XX. The Condition of Necessity Which a Judgment of Taste Asserts I the Idea of a Common Sense

If judgments of taste (like cognitive judgments) had a definite objective principle, then the person who lays them down in accordance with this latter would claim an unconditioned necessity for his judgment. If they were devoid of all principle, like those of the mere taste of sense, we would not allow them in thought any necessity whatever. Hence they must have a subjective principle which determines what pleases or displeases only by feeling and not by concepts, but yet with universal validity. But such a principle could only be regarded as a *common sense,* which is essentially different from common understanding which people sometimes call common sense *(sensus communis);* for the latter does not judge by feeling but always by concepts, although ordinarily only as by obscurely represented principles.

Hence it is only under the presupposition that there is a common sense (by which we do not understand an external sense, but the effect resulting from the free play of our cognitive powers)—it is only under this presupposition, I say, that the judgment of taste can be laid down.

XXI. Have We Ground for Presupposing a Common Sense?

Cognitions and judgments must, along with the conviction that accompanies them, admit of universal communicability; for otherwise there would be no harmony between them and the object, and they would be collectively a mere subjective play of the representative powers, exactly as scepticism desires. But if cognitions are to admit of communicability, so must also the state of mind—i.e. the accordance of the cognitive powers with a cognition generally and that proportion of them which is suitable for a representation (by which an object is given to us) in order that a cognition may be made out of it—admit of universal communicability. For without this as the subjective condition of cognition, cognition as an effect could not arise. This actually always takes place when a given object by means of sense excites the imagination to collect the manifold, and the imagination in its turn excites the understanding to bring about a unity of this collective process in concepts. But this accordance of the cognitive powers has a different proportion according to the variety of the objects which are given. However, it must be such that this internal relation, by which one mental faculty is excited by another, shall be generally the most beneficial for both faculties in respect of cognition (of given objects); and this accordance can only be determined by feeling (not according to concepts). Since now this accordance itself must admit of universal communicability, and consequently also our feeling of it (in a given representation), and since the universal communicability of a feeling presupposes a common sense, we have grounds for assuming this latter. And this common sense is assumed without relying on psychological observations, but simply as the necessary condition of the universal communicability of our knowledge, which is presupposed in every logic and in every principle of knowledge that is not sceptical.

XXII. The Necessity of the Universal Agreement That Is Thought in a Judgment of Taste Is a Subjective Necessity, Which Is Represented as Objective Under the Presupposition of a Common Sense

In all judgments by which we describe anything as beautiful, we allow no one to be of another opinion, without, however, grounding our judgment on concepts, but only on our feeling, which we therefore place at its basis, not as a private, but as a common feeling. Now this common sense cannot be grounded on experience, for it aims at justifying judgments which contain an *ought.* It does not say that everyone *will* agree with my judgment, but that he *ought.* And so common sense, as an example of whose judgment I here put forward my judgment of taste and on account of which I attribute to the latter an *exemplary* validity, is a mere ideal norm, under the supposition of which I have a right to make into a rule for everyone a judgment that accords therewith, as well as the satisfaction in an object expressed in such judgment. For the principle which concerns the agreement of different judging persons, although only subjective, is yet assumed as subjectively universal (an idea necessary for everyone), and thus can claim universal assent (as if it were objective) provided we are sure that we have correctly subsumed [the particulars] under it.

This indeterminate norm of a common sense is actually presupposed by us, as is shown by our claim to lay down judgments of taste. Whether there is in fact such a common sense, as a constitutive principle of the possibility of experience, or whether a yet higher principle of reason makes it only into a regulative principle for producing in us a common sense for higher purposes; whether, therefore, taste is an original and natural faculty or only the idea of an artificial one yet to be acquired, so that a judgment of taste with its assumption of a universal assent in fact is only a requirement of reason for producing such harmony of sentiment; whether the ought, i.e. the objective necessity of the confluence of the feeling of any one man with that of every other, only signifies the possibility of arriving at this accord, and the judgment of taste only affords an example of the application of this principle—these questions we have neither the wish nor the power to investigate as yet; we have now only to resolve the faculty of taste into its elements in order to unite them at last in the idea of a common sense.

Explanation of the Beautiful Resulting from the Fourth Moment

The *beautiful* is that which without any concept is cognized as the object of a *necessary* satisfaction.

Second Book

Analytic of the Sublime

XXIII. Transition from the Faculty Which Judges of the Beautiful to That Which Judges of the Sublime

The beautiful and the sublime[16] agree in this that both please in themselves. Further, neither presupposes a judgment of sense nor a judgment logically determined, but a judgment of reflection. Consequently the satisfaction belonging to them does not depend on a sensation, as in the case of the pleasant, nor on a definite concept, as in the case of the good; but it is nevertheless referred to concepts, although indeterminate ones. And so the satisfaction is connected with the mere presentation of the object or with the faculty of presentation, so that in the case of a given intuition this faculty or the imagination is considered as in agreement with the *faculty of concepts* of understanding or reason, regarded as promoting these latter. Hence both kinds of judgments are *singular,* and yet announce themselves as universally valid for every subject; although they lay claim merely to the feeling of pleasure, and not to any cognition of the object.

But there are also remarkable differences between the two. The beautiful in nature is connected with the form of the object, which consists in having definite boundaries. The sublime, on the other hand, is to be found in a formless object, so far as in it or by occasion of it *boundlessness* is represented, and yet its totality is also present to thought. Thus the beautiful seems to be regarded as the presentation of an indefinite concept of understanding, the sublime as that of a like concept of reason. There the satisfaction in the one case is bound up with the representation of *quality,* in the other with that of *quantity.* And the latter satisfaction is quite different in kind from the former, for this [the beautiful] directly brings with it a feeling of the furtherance of life, and thus is compatible with charms and with the play of the imagination. But the other the feeling of the sublime is a pleasure that arises only indirectly; viz. it is produced by the feeling of a momentary checking of the vital powers and a consequent stronger outflow of them, so that it seems to be regarded as emotion—not play, but earnest in the exercise of the imagination. Hence it is incompatible with physical charm; and as the mind is not merely attracted by the object but is ever being alternately repelled, the satisfaction in the sublime does not so much involve the positive pleasure as admiration or respect, which rather deserves to be called negative pleasure.

But the inner and most important distinction between the sublime and beautiful is, certainly, as follows. (Here, as we are entitled to do, we only bring under consideration in the first instance the sublime in natural objects, for the sublime of art is always limited by the conditions of agreement with nature.) Natural beauty (which is independent) brings with it a purposiveness in its form by which the object seems to be, as it were, preadapted to our judgment, and thus constitutes in itself an object of satisfaction. On the other hand, that which excites in us, without any reasoning about it, but in the mere apprehension of it, the feeling of the sublime may appear, as regards its form, to violate purpose in respect of the judgment, to be unsuited to our presentative faculty, and as it were to do violence to the imagination; and yet it is judged to be only the more sublime.

---

[16] Kant had read Burke on the sublime and beautiful (above, page 333), and strove to go beyond Burke's relatively simplistic views, especially of the sublime.

Now we may see from this that, in general, we express ourselves incorrectly if we call any *object of nature* sublime, although we can quite correctly call many objects of nature beautiful. For how can that be marked by an expression of approval which is apprehended in itself as being a violation of purpose? All that we can say is that the object is fit for the presentation of a sublimity which can be found in the mind, for no sensible form can contain the sublime properly so-called. This concerns only ideas of the reason which, although no adequate presentation is possible for them, by this inadequateness that admits of sensible presentation are aroused and summoned into the mind. Thus the wide ocean, disturbed by the storm, cannot be called sublime. Its aspect is horrible; and the mind must be already filled with manifold ideas if it is to be determined by such an intuition to a feeling itself sublime, as it is incited to abandon sensibility and to busy itself with ideas that involve higher purposiveness.

Independent natural beauty discovers to us a technique of nature which represents it as a system in accordance with laws, the principle of which we do not find in the whole of our faculty of understanding. That principle is the principle of purposiveness, in respect of the use of our judgment in regard to phenomena, which requires that these must not be judged as merely belonging to nature in its purposeless mechanism, but also as belonging to something analogous to art. It therefore actually extends, not indeed our cognition of natural objects, but our concept of nature, which is now not regarded as mere mechanism but as art. This leads to profound investigations as to the possibility of such a form. But in what we are accustomed to call sublime there is nothing at all that leads to particular objective principles and forms of nature corresponding to them; so far from it that, for the most part, nature excites the ideas of the sublime in its chaos or in its wildest and most irregular disorder and desolation, provided size and might are perceived. Hence, we see that the concept of the sublime is not nearly so important or rich in consequences as the concept of the beautiful; and that, in general, it displays nothing purposive in nature itself, but only in that possible use of our intuitions of it by which there is produced in us a feeling of a purposiveness quite independent of nature. We must seek a ground external to ourselves for the beautiful of nature, but seek it for the sublime merely in ourselves and in our attitude of thought, which introduces sublimity into the representation of nature. This is a very needful preliminary remark, which quite separates the ideas of the sublime from that of a purposiveness of *nature* and makes the theory of the sublime a mere appendix to the aesthetical judging of that purposiveness, because by means of it no particular form is represented in nature, but there is only developed a purposive use which the imagination makes of its representation.

XXIV. Of the Divisions of an Investigation into the Feeling of the Sublime

* * *

But the analysis of the sublime involves a division not needed in the case of the beautiful, viz. a division into the *mathematically* and the *dynamically sublime.*

For the feeling of the sublime brings with it as its characteristic feature a *movement* of the mind bound up with the judging of the object, while in the case of the beautiful taste presupposes and maintains the mind in *restful* contemplation. Now this movement ought to be judged as subjectively purposive (because the sublime pleases us), and thus it is referred through the imagination either to the *faculty of cognition* or *of desire.* In either reference the purposiveness of the given representation ought to be judged only in respect of this *faculty* (without purpose or interest), but in the first case it is ascribed to the object as a *mathematical* determination of the imagination, in the second as *dynamical.* And hence we have this twofold way of representing the sublime.

A. Of the Mathematically Sublime

XXV. Explanation of the Term Sublime

We call that *sublime* which is *absolutely great.* But to be great and to be a great something are quite different concepts (*magnitudo* and *quantitas*). In like manner to say simply *(simpliciter)* that anything is *great* is quite different from saying that it is *absolutely great (absolute, non comparative magnum).* The latter is *what is great beyond all comparison.* What now is meant by the expression that anything is great or small or of medium size? It is not a pure concept of understanding that is thus signified; still less is it an intuition of sense; and just as little is it a concept of reason, because it brings with it no principle of cognition. It must therefore be a concept of judgment or derived from one, and a subjective purposiveness of the representation in reference to the judgment must lie at its basis. That anything is a magnitude *(quantum)* may be cognized from the thing itself, without any comparison of it with other things, viz. if there is a multiplicity of the homogeneous constituting one thing. But to cognize *how great* it is always requires some other magnitude as a measure. But because the judging of magnitude depends, not merely on multiplicity (number), but also on the magnitude of the unit (the measure), and since, to judge of the magnitude of this latter again requires another as measure with which it may be compared, we see that the determination of the magnitude of phenomena can supply no absolute concept whatever of magnitude, but only a comparative one.

If now I say simply that anything is great, it appears that I have no comparison in view, at least none with an objective measure, because it is thus not determined at all how great the object is. But although the standard of comparison is merely subjective, yet the judgment nonetheless claims universal assent; "this man is beautiful" and "he is tall" are judgments, not limited merely to the judging subject, but, like theoretical judgments, demanding the assent of everyone.

In a judgment by which anything is designated simply as great, it is not merely meant that the object has a magnitude, but that this magnitude is superior to that of many other objects of the same kind, without, however, any exact determination of this superiority. Thus there is always at the basis of our judgment a standard which we assume as the same for everyone; this, however, is not available for any logical (mathematically definite) judging of magnitude, but only for aesthetical judging of the same, because it is a merely subjective standard lying at the basis of the reflective judgment upon magnitude. It may be empirical, as, e.g., the average size of the men known to us, of animals of a certain kind, trees, houses, mountains, etc. Or it may be a standard given a priori which, through the defects of the judging subject, is limited by the subjective conditions of presentation *in concreto,* as, e.g., in the practical sphere, the greatness of a certain virtue or of the public liberty and justice in a country, or, in the theoretical sphere, the greatness of the accuracy or the inaccuracy of an observation or measurement that has been made, etc.

Here it is remarkable that, although we have no interest whatever in an object—i.e. its existence is indifferent to us—yet its mere size, even if it is considered as formless, may bring a satisfaction with it that is universally communicable and that consequently involves the consciousness of a subjective purposiveness in the use of our cognitive faculty. This is not indeed a satisfaction in the object (because it may be formless), as in the case of the beautiful, in which the reflective judgment finds itself purposively determined in reference to cognition in general, but a satisfaction in the extension of the imagination by itself.

If (under the above limitation) we say simply of an object "it is great," this is no mathematically definite judgment, but a mere judgment of reflection upon the representation of it, which is subjectively purposive for a certain use of our cognitive powers in the estimation of magnitude; and we always then bind up with the representation a kind of respect, as also a kind of contempt, for what we simply call "small." Further, the judging of things as great or small extends to everything, even to all their characteristics; thus we describe beauty as great or small. The reason of this is to be sought in the fact that whatever we present in intuition according to the precept of the judgment (and thus represent aesthetically) is always a phenomenon, and thus a quantum.

But if we call anything, not only great, but absolutely great in every point of view (great beyond all comparison), i.e. sublime, we soon see that it is not permissible to seek for an adequate standard of this outside itself, but merely in itself. It is a magnitude which is like itself alone. It follows hence that the sublime is not to be sought in the things of nature, but only in our ideas; but in which of them it lies must be reserved for the "Deduction."

The foregoing explanation can be thus expressed: *the sublime is that in comparison with which everything else is small.* Here we easily see that nothing can be given in nature, however great it is judged by us to be, which could not, if considered in another relation, be reduced to the infinitely small; and conversely there is nothing so small which does not admit of extension by our imagination to the greatness of a world if compared with still smaller standards. Telescopes have furnished us with abundant material for making the first remark, microscopes for the second. Nothing, therefore, which can be an object of the senses is, considered on this basis, to be called sublime. But because there is in our imagination a striving toward infinite progress and in our reason a claim for absolute totality, regarded as a real idea, therefore this very inadequateness for that idea in our faculty for estimating the magnitude of things of sense excites in us the feeling of a supersensible faculty. And it is not the object of sense, but the use which the judgment naturally makes of certain objects on behalf of this latter feeling that is absolutely great, and in comparison every other use is small. Consequently it is the state of mind produced by a certain representation with which the reflective judgment is occupied, and not the object, that is to be called sublime.

We can therefore append to the preceding formulas explaining the sublime this other: *the sublime is that, the mere ability to think which shows a faculty of the mind surpassing every standard of sense.*

XXVI. Of That Estimation of the Magnitude of Natural Things Which Is Requisite for the Idea of the Sublime

* * *

Nature is . . . sublime in those of its phenomena whose intuition brings with it the idea of its infinity. This last can only come by the inadequacy of the greatest effort of our imagination to estimate the magnitude of an object. But now, in mathematical estimation of magnitude, the imagination is equal to providing a sufficient measure for every object, because the numerical concepts of the understanding, by means of progression, can make any measure adequate to any given magnitude. Therefore it must be the *aesthetical* estimation of magnitude in which the effort toward comprehension surpasses the power of the imagination. Here it is felt that we can comprehend in a whole of intuition the progressive apprehension, and at the same time we perceive the inadequacy of this faculty, unbounded in its progress, for grasping and using any fundamental measure available for the estimation of magnitude with the easiest application of the understanding. Now the proper unchangeable fundamental measure of nature is its absolute whole, which, regarding nature as a phenomenon, would be infinity comprehended. But since this fundamental measure is a self-contradictory concept (on account of the impossibility of the absolute totality of an endless progress), that magnitude of a natural object on which the imagination fruitlessly spends its whole faculty of comprehension must carry our concept of nature to a supersensible substrate (which lies at its basis and also at the basis of our faculty of thought). As this, however, is great beyond all standards of sense, it makes us judge as *sublime,* not so much the object, as our own state of mind in the estimation of it.

Therefore, just as the aesthetical judgment in judging the beautiful refers the imagination in its free play to the *understanding*, in order to harmonize it with the *concepts* of the latter in general (without any determination of them), so does the same faculty, when judging a thing as sublime, refer itself to the *reason,* in order that it may subjectively be in accordance with its *ideas* (no matter what they are)—i.e. that it may produce a state of mind conformable to them and compatible with that brought about by the influence of definite (practical) ideas upon feeling.

We hence see also that true sublimity must be sought only in the mind of the subject judging, not in the natural object the judgment upon which occasions this state. Who would call sublime, e.g., shapeless mountain masses piled in wild disorder upon one another with their pyramids of ice, or the gloomy, raging sea? But the mind feels itself raised in its own judgment if, while contemplating them without any reference to their form, and abandoning itself to the imagination and to the reason—which, although placed in combination with the imagination without any definite purpose, merely extends it—it yet finds the whole power of the imagination inadequate to its ideas.

Examples of the mathematically sublime of nature in mere intuition are all the cases in which we are given, not so much a larger numerical concept, as a large unit for the measure of the imagination (for shortening the numerical series). A tree, the height of which we estimate with reference to the height of a man, at all events gives a standard for a mountain; if this were a mile high, it would serve as unit for the number expressive of the earth's diameter, so that the latter might be made intuitible. The earth's diameter would supply a unit for the known planetary system; this again for the Milky Way; and the immeasurable number of Milky Way systems called nebulae, which presumably constitute a system of the same kind among themselves, lets us expect no bounds here. Now the sublime in the aesthetical judging of an immeasurable whole like this lies, not so much in the greatness of the number of units, as in the fact that in our progress we ever arrive at yet greater units. To this the systematic division of the universe contributes, which represents every magnitude in nature as small in its turn, and represents our imagination with its entire freedom from bounds, and with it nature, as a mere nothing in comparison with the ideas of reason if it is sought to furnish a presentation which shall be adequate to them.

XXVII. Of the Quality of the Satisfaction in Our Judgments upon the Sublime

The feeling of our incapacity to attain to an idea *which is a law for us* is *respect.* Now the idea of the comprehension of every phenomenon that can be given us in the intuition of a whole is an idea prescribed to us by a law of reason, which recognizes no other measure, definite, valid for everyone, and invariable, than the absolute whole. But our imagination, even in its greatest efforts, in respect of that comprehension which we expect from it of a given object in a whole of intuition (and thus with reference to the presentation of the idea of reason) exhibits its own limits and inadequacy, although at the same time it shows that its destination is to make itself adequate to this idea regarded as a law. Therefore the feeling of the sublime in nature is respect for our own destination, which, by a certain subreption, we attribute to an object of nature (conversion of respect for the idea of humanity in our own subject into respect for the object). This makes intuitively evident the superiority of the rational determination of our cognitive faculties to the greatest faculty of our sensibility.

The feeling of the sublime is therefore a feeling of pain arising from the want of accordance between the aesthetical estimation of magnitude formed by the imagination and the estimation of the same formed by reason. There is at the same time a pleasure thus excited, arising from the correspondence with rational ideas of this very judgment of the inadequacy of our greatest faculty of sense, insofar as it is a law for us to strive after these ideas. In fact it is for us a law (of reason) and belongs to our destination to estimate as small, in comparison with ideas of reason, everything which nature, regarded as an object of sense, contains that is great for us; and that which arouses in us the feeling of this supersensible destination agrees with that law. Now the greatest effort of the imagination in the presentation of the unit for the estimation of magnitude indicates a reference to something *absolutely great,* and consequently a reference to the law of reason, which bids us take this alone as our highest measure of magnitude. Therefore the inner perception of the inadequacy of all sensible standards for rational estimation of magnitude indicates a correspondence with rational laws; it involves a pain, which arouses in us the feeling of our supersensible destination, according to which it is purposive and therefore pleasurable to find every standard of sensibility inadequate to the ideas of understanding.

The mind feels itself *moved* in the representation of the sublime in nature, while in aesthetical judgments about the beautiful it is in *restful* contemplation. This movement may (especially in its beginnings) be compared to a vibration, i.e. to a quickly alternating attraction toward, and repulsion from, the same object. The transcendent (toward which the imagination is impelled in its apprehension of intuition) is for the imagination like an abyss in which it fears to lose itself; but for the rational idea of the supersensible it is not transcendent, but in conformity with law to bring about such an effort of the imagination, and consequently here there is the same amount of attraction as there was of repulsion for the mere sensibility. But the judgment itself always remains in this case only aesthetical, because, without having any determinate concept of the object at its basis, it merely represents the subjective play of the mental powers (imagination and reason) as harmonious through their very contrast. For just as imagination and *understanding,* in judging of the beautiful, generate a subjective purposiveness of the mental powers by means of their harmony, so [in this case] imagination and *reason* do so by means of their conflict. That is, they bring about a feeling that we possess pure self-subsistent reason, or a faculty for the estimation of magnitude, whose superiority can be made intuitively evident only by the inadequacy of that faculty (imagination) which is itself unbounded in the presentation of magnitudes (of sensible objects).

* * *

B. Of the Dynamically Sublime in Nature

XXVIII. Of Nature Regarded as Might

Might is that which is superior to great hindrances. It is called *dominion* if it is superior to the resistance of that which itself possesses might. Nature, considered in an aesthetical judgment as might that has no dominion over us, is *dynamically sublime.*

If nature is to be judged by us as dynamically sublime, it must be represented as exciting fear (although it is not true conversely that every object which excites fear is regarded in our aesthetical judgment as sublime). For in aesthetical judgments (without the aid of concepts) superiority to hindrances can only be judged according to the greatness of the resistance. Now that which we are driven to resist is an evil and, if we do not find our faculties a match for it, is an object of fear. Hence nature can be regarded by the aesthetical judgment as might, and consequently as dynamically sublime, only so far as it is considered an object of fear.

But we can regard an object as *fearful* without being afraid *of* it, viz. if we judge of it in such a way that we merely *think* a case in which we would wish to resist it and yet in which all resistance would be altogether vain. Thus the virtuous man fears God without being afraid of him, because to wish to resist him and his commandments he thinks is a case that he need not apprehend. But in every such case that he thinks as not impossible, he cognizes him as fearful.

He who fears can form no judgment about the sublime in nature, just as he who is seduced by inclination and appetite can form no judgment about the beautiful. The former flies from the sight of an object which inspires him with awe, and it is impossible to find satisfaction in a terror that is seriously felt. Hence the pleasurableness arising from the cessation of an uneasiness is *a state of joy.* But this, on account of the deliverance from danger which is involved, is a state of joy when conjoined with the resolve that we shall no more be exposed to the danger; we cannot willingly look back upon our sensations of danger; much less seek the occasion for them again.

Bold, overhanging, and, as it were, threatening rocks; clouds piled up in the sky, moving with lightning flashes and thunder peals; volcanoes in all their violence of destruction; hurricanes with their track of devastation; the boundless ocean in a state of tumult; the lofty waterfall of a mighty river, and such like—these exhibit our faculty of resistance as insignificantly small in comparison with their might. But the sight of them is the more attractive, the more fearful it is, provided only that we are in security; and we willingly call these objects sublime, because they raise the energies of the soul above their accustomed height and discover in us a faculty of resistance of a quite different kind, which gives us courage to measure ourselves against the apparent almightiness of nature.

Now, in the immensity of nature and in the insufficiency of our faculties to take in a standard proportionate to the aesthetical estimation of the magnitude of its *realm,* we find our own limitation, although at the same time in our rational faculty we find a different, nonsensuous standard, which has that infinity itself under it as a unity, in comparison with which everything in nature is small, and thus in our mind we find a superiority to nature even in its immensity. And so also the irresistibility of its might, while making us recognize our own physical impotence, considered as beings of nature, discloses to us a faculty of judging independently of and a superiority over nature, on which is based a kind of self-preservation entirely different from that which can be attacked and brought into danger by external nature. Thus humanity in our person remains unhumiliated, though the individual might have to submit to this dominion. In this way nature is not judged to be sublime in our aesthetical judgments in so far as it excites fear, but because it calls up that power in us (which is not nature) of regarding as small the things about which we are solicitous (goods, health, and life), and of regarding its might (to which we are no doubt subjected in respect of these things) as nevertheless without any dominion over us and our personality to which we must bow where our highest fundamental propositions, and their assertion or abandonment, are concerned. Therefore nature is here called sublime merely because it elevates the imagination to a presentation of those cases in which the mind can make felt the proper sublimity of its destination, in comparison with nature itself.

* * *

Sublimity . . . does not reside in anything of nature, but only in our mind, insofar as we can become conscious that we are superior to nature within, and therefore also to nature without us (so far as it influences us). Everything that excites this feeling in us, e.g. the *might* of nature which calls forth our forces, is called then (although improperly) sublime. Only by supposing this idea in ourselves and in reference to it are we capable of attaining to the idea of the sublimity of that Being which produces respect in us, not merely by the might that it displays in nature, but rather by means of the faculty which resides in us of judging it fearlessly and of regarding our destination as sublime in respect of it.

XLIX. Of the Faculties of the Mind That Constitute Genius

We say of certain products of which we expect that they should at least in part appear as beautiful art, they are without *spirit,*[17] although we find nothing to blame in them on the score of taste. A poem may be very neat and elegant, but without spirit. A history may be exact and well arranged, but without spirit. A festal discourse may be solid and at the same time elaborate, but without spirit. Conversation is often not devoid of entertainment, but it is without spirit; even of a woman we say that she is pretty, an agreeable talker, and courteous, but without spirit. What then do we mean by *spirit?*

Spirit, in an aesthetical sense, is the name given to the animating principle of the mind. But that by means of which this principle animates the soul, the material which it applies to that purpose, is what puts the mental powers purposively into swing, i.e. into such a play as maintains itself and strengthens the mental powers in their exercise.

Now I maintain that this principle is no other than the faculty of presenting *aesthetical ideas.* And by an *aesthetical idea* I understand that representation of the imagination which occasions much thought, without however any definite thought, i.e., any *concept,* being capable of being adequate to it; it consequently cannot be completely compassed and made intelligible by language. We easily see that it is the counterpart (pendant) of a *rational idea,* which conversely is a concept to which no *intuition* (or representation of the imagination) can be adequate.[18]

The imagination (as a productive faculty of cognition) is very powerful in creating another nature, as it were, out of the material that actual nature gives it. We entertain ourselves with it when experience becomes too commonplace, and by it we remold experience, always indeed in accordance with analogical laws, but yet also in accordance with principles which occupy a higher place in reason (laws, too, which are just as natural to us as those by which understanding comprehends empirical nature). Thus we feel our freedom from the law of association (which attaches to the empirical employment of imagination), so that the material supplied to us by nature in accordance with this law can be worked up into something different which surpasses nature.

Such representations of the imagination we may call *ideas,* partly because they at least strive after something which lies beyond the bounds of experience and so seek to approximate to a presentation of concepts of reason (intellectual ideas), thus giving to the latter the appearance of objective reality, but especially because no concept can be fully adequate to them as internal intuitions. The poet ventures to realize to sense, rational ideas of invisible beings, the kingdom of the blessed, hell, eternity, creation, etc.; or even if he deals with things of which there are examples in experience—e.g. death, envy and all vices, also love, fame, and the like—he tries, by means of imagination, which emulates the play of reason in its quest after a maximum, to go beyond the limits of experience and to present them to sense with a completeness of which there is no example in nature. This is properly speaking the art of the poet, in which the faculty of aesthetical ideas can manifest itself in its entire strength. But this faculty, considered in itself, is properly only a talent (of the imagination).

---

[17] [Bernard] In English we would rather say "without soul," but I prefer to translate *Geist* consistently by "spirit," to avoid the confusion of it with *Seele.*[1]

[18] This is a key paragraph. The aesthetical idea as described here gives a philosophical basis for the attack on paraphrase of poems in the New Criticism. See Brooks (below, page 1036).

If now we place under a concept a representation of the imagination belonging to its presentation, but which occasions in itself more thought than can ever be comprehended in a definite concept and which consequently aesthetically enlarges the concept itself in an unbounded fashion, the imagination is here creative, and it brings the faculty of intellectual ideas (the reason) into movement; i.e. by a representation more thought (which indeed belongs to the concept of the object) is occasioned than can in it be grasped or made clear.

Those forms which do not constitute the presentation of a given concept itself but only, as approximate representations of the imagination, express the consequences bound up with it and its relationship to other concepts, are called (aesthetical) *attributes* of an object whose concept as a rational idea cannot be adequately presented. Thus Jupiter's eagle with the lightning in its claws is an attribute of the mighty king of heaven, as the peacock is of his magnificent queen. They do not, like *logical attributes,* represent what lies in our concepts of the sublimity and majesty of creation, but something different, which gives occasion to the imagination to spread itself over a number of kindred representations that arouse more thought than can be expressed in a concept determined by words. They furnish an *aesthetical idea,* which for that rational idea takes the place of logical presentation; and thus, as their proper office, they enliven the mind by opening out to it the prospect into an illimitable field of kindred representations. But beautiful art does this not only in the case of painting or sculpture (in which the term "attribute" is commonly employed); poetry and rhetoric also get the spirit that animates their works simply from the aesthetical attributes of the object, which accompany the logical and stimulate the imagination, so that it thinks more by their aid, although in an undeveloped way, than could be comprehended in a concept and therefore in a definite form of words. For the sake of brevity, I must limit myself to a few examples only.

When the great King in one of his poems expresses himself as follows:

> *Oui, finissons sans trouble et mourons sans regrets,*
> *En laissant l'univers comblé de nos bienfaits.*
> *Ainsi l'astre du jour au bout de sa carrière,*
> *Répand sur l'horizon une douce lumière;*
> *Et les derniers rayons qu'il darde dans les airs,*
> *Sont les derniers soupirs qu'il donne à l'univers;*[19]

he quickens his rational idea of a cosmopolitan disposition at the end of life by an attribute which the imagination (in remembering all the pleasures of a beautiful summer day that are recalled at its close by a serene evening) associates with that representation, and which excites a number of sensations and secondary representations for which no expression is found. On the other hand, an intellectual concept may serve conversely as an attribute for a representation of sense, and so can quicken this latter by means of the idea of the supersensible, but only by the aesthetical element, that subjectively attaches to the concept of the latter, being here employed. Thus, for example, a certain poet says, in his description of a beautiful morning: "The sun arose / As calm from virtue springs." The consciousness of virtue, if we substitute it in our thoughts for a virtuous man, diffuses in the mind a multitude of sublime and restful feelings, and a boundless prospect of a joyful future, to which no expression that is measured by a definite concept completely attains.[20]

In a word, the aesthetical idea is a representation of the imagination associated with a given concept, which is bound up with such a multiplicity of partial representations in its free employment that for it no expression marking a definite concept can be found; and such a representation, therefore, adds to a concept much ineffable thought, the feeling of which quickens the cognitive faculties, and with language, which is the mere letter, binds up spirit also.

---

[19] "Yes, let us end without disorder and die without regrets, / Leaving the universe filled with our blessings. / Thus the day star at the end of its course, / Sheds on the horizon a gentle light; / And the last rays that it beams into the air, / Are the last sighs that it gives to the universe." [Bernard] Barni quotes these lines as occurring in one of Frederick the Great's French poems: "Epître au maréchal Keith, sur les vaines terreurs de la mort et les frayeurs d'une autre vie"; but I have not been able to verify his reference. Kant here translates them into German.

[20] [Kant] Perhaps nothing more sublime was ever said and no sublimer thought ever expressed than the famous inscription on the Temple of Isis (Mother nature): "I am all that is and that was and that shall be, and no mortal has lifted my veil." Segner availed himself of this idea in a *suggestive* vignette prefixed to his *Natural Philosophy,* in order to inspire beforehand the pupil whom he was about to lead into that temple with a holy awe, which should dispose his mind to serious attention.

* * *

LIII. Comparison of the Respective Aesthetical Worth of the Beautiful Arts

Of all the arts *poetry* (which owes its origin almost entirely to genius and will least be guided by precept or example) maintains the first rank. It expands the mind by setting the imagination at liberty and by offering, within the limits of a given concept, amid the unbounded variety of possible forms accordant therewith, that which unites the presentment of this concept with a wealth of thought to which no verbal expression is completely adequate, and so rising aesthetically to ideas. It strengthens the mind by making it feel its faculty—free, spontaneous, and independent of natural determination—of considering and judging nature as a phenomenon in accordance with aspects which it does not present in experience either for sense or understanding, and therefore of using it on behalf of, and as a sort of schema for, the supersensible. It plays with illusion, which it produces at pleasure, but without deceiving by it; for it declares its exercise to be mere play, which however can be purposively used by the understanding. Rhetoric, insofar as this means the art of persuasion, i.e. of deceiving by a beautiful show *(ars oratoria),* and not mere elegance of speech (eloquence and style), is a dialectic which borrows from poetry only so much as is needful to win minds to the side of the orator before they have formed a judgment and to deprive them of their freedom; it cannot therefore be recommended either for the law courts or for the pulpit. For if we are dealing with civil law, with the rights of individual persons, or with lasting instruction and determination of people's minds to an accurate knowledge and a conscientious observance of their duty, it is unworthy of so important a business to allow a trace of any luxuriance of wit and imagination to appear, and still less any trace of the art of talking people over and of captivating them for the advantage of any chance person. For although this art may sometimes be directed to legitimate and praiseworthy designs, it becomes objectionable when in this way maxims and dispositions are spoiled in a subjective point of view, though the action may objectively be lawful. It is not enough to do what is right; we should practice it solely on the ground that it is right. Again, the mere concept of this species of matters of human concern, when clear and combined with a lively presentation of it in examples, without any offense against the rules of euphony of speech or propriety of expression, has by itself for ideas of reason (which collectively constitute eloquence) sufficient influence upon human minds; so that it is not needful to add the machinery of persuasion, which, since it can be used equally well to beautify or to hide vice and error, cannot quite lull the secret suspicion that one is being artfully overreached. In poetry everything proceeds with honesty and candor. It declares itself to be a mere entertaining play of the imagination, which wishes to proceed as regards form in harmony with the laws of the understanding; and it does not desire to steal upon and ensnare the understanding by the aid of sensible presentation.[21]

---

[21] [Kant] I must admit that a beautiful poem has always given me a pure gratification, while the reading of the best discourse, whether of a Roman orator or of a modern parliamentary speaker or of a preacher, has always been mingled with an unpleasant feeling of disapprobation of a treacherous art which means to move men in important matters like machines to a judgment that must lose all weight for them on quiet reflection. Readiness and accuracy in speaking (which taken together constitute rhetoric) belong to beautiful art, but the art of the orator *(ars oratoria),* the art of availing oneself of the weaknesses of men for one's own designs (whether these be well meant or even actually good does not matter), is worthy of no *respect.* Again, this art only reached its highest point, both at Athens and at Rome, at a time when the state was hastening to its ruin and true patriotic sentiment had disappeared. The man who, along with a clear insight into things, has in his power a wealth of pure speech, and who with a fruitful imagination capable of presenting his ideas unites a lively sympathy with what is truly good, is *vir bonus dicendi peritus,* the orator without art but of great impressiveness, as Cicero has it, though he may not always be true to this ideal. [Here Kant draws a distinction between poetry and oratory, in contrast to Plato's identification of both with sophistry (above, page 8).]

Mary Wollstonecraft

1759–1797

Mary Wollstonecraft's *A Vindication of the Rights of Woman* (1792) well deserves its rank as the first great feminist work. It is her most famous work, but not her first or last. She had already published fiction when in 1790 she answered Edmund Burke's *Reflections on the Revolution in France* with her *A Vindication of the Rights of Man* before Thomas Paine wrote his *Rights of Man* (1791–1792). Having associated with Dissenters who supported the French Revolution, she was outraged at Burke's attack and in turn opposed British identification of security of property with liberty, arguing for the breakup of large estates and going on to propose numerous reforms, both economic and social. The book made her well known.

In *A Vindication of the Rights of Woman* she went beyond her Dissenter friends, whose views remained strictly patriarchal. Written in about six weeks, the book was insufficiently revised but nevertheless achieves an effective tone. In general, the fundamental principles enunciated are that the mind does not know sex and that, as Claire Tomalin has remarked "... society is wasting its assets if it retains women in the role of convenient domestic slaves and alluring mistresses, denies them economic independence and encourages them to be docile and attentive to their looks to the exclusion of all else."

Chapter Six, below, of *Vindication* follows a long chapter that discusses a number of writers' attitudes toward female character and education. Wollstonecraft accepts the common theory of the association of ideas set forth in David Hartley's *Observations of Man* (1749) and employed by David Hume in his *Enquiry Concerning Human Understanding.* Her emphasis on the importance of impressions leads her in Chapter Thirteen, Part Two, to attack the sentimental novels of her time for their pernicious influences on women's intellectual development.

Mary Wollstonecraft's works include *Thoughts on the Education of Daughters* (1787); *Original Stories* (1788); *A Vindication of the Rights of Man* (1790); *A Vindication of the Rights of Woman* (1792); *A Historical and Moral View of the Origin and Progress of the French Revolution* (1794); *Letters Written during a Short Residence in Sweden, Norway and Denmark* (1796); and *Posthumous Works* (ed. Godwin, 1798). See Emma Rauschenbusch-Clough, *A Study of Mary Wollstonecraft and the Rights of Woman* (1898); Virgina Woolf, "Mary Wollstonecraft," *The Second Common Reader* (1932); Margaret George, *One Woman's Situation* (1970); Eleanor Flexner, *Mary Wollstonecraft* (1972); Claire Tomalin, *The Life and Death of Mary Wollstonecraft* (1974); Alan Cumming, *Mary Wollstonecraft and Eighteenth Century Theorists* (1980); Jennifer Lorch, *Mary Wollstonecraft: The Making of a Radical Feminist* (1990); Harriet Divine Jump, *Mary Wollstonecraft: Writer* (1994); Eileen Janes Yeo, *Mary Wollstonecraft and Two Hundred Years of Feminisms* (1997); Janet M. Todd, *Mary Wollstonecraft: A Revolutionary Life* (2000); Ashley Tauchert, *Mary Wollstonecraft and the Accent of the Feminine* (2002); Barbara Taylor, *Mary Wollstonecraft and the Feminist Imagination* (2003).

A Vindication of the Rights of Woman

Chapter VI

The Effect Which an Early Association of Ideas Has upon the Character

Educated in the enervating style recommended by the writers on whom I have been animadverting; and not having a chance, from their subordinate state in society, to recover their lost ground, is it surprising that women everywhere appear a defect in nature? Is it surprising, when we consider what a determinate effect an early association of ideas has on the character, that they neglect their understandings, and turn all their attention to their persons?

The great advantages which naturally result from storing the mind with knowledge, are obvious from the following considerations. The association of our ideas is either habitual or instantaneous; and the latter mode seems rather to depend on the original temperature of the mind than on the will. When the ideas, and matters of fact, are once taken in, they lie by for use, till some fortuitous circumstance makes the information dart into the mind with illustrative force, that has been received at very different periods of our lives. Like the lightning's flash are many recollections; one idea assimilating and explaining another, with astonishing rapidity. I do not now allude to that quick perception of truth, which is so intuitive that it baffles research, and makes us at a loss to determine whether it is reminiscence or ratiocination, lost sight of in its celerity, that opens the dark cloud. Over those instantaneous associations we have little power; for when the mind is once enlarged by excursive flights, or profound reflection, the raw materials will, in some degree, arrange themselves. The understanding, it is true, may keep us from going out of drawing when we group our thoughts, or transcribe from the imagination the warm sketches of fancy; but the animal spirits, the individual character, give the colouring. Over this subtile electric fluid,[1] how little power do we possess, and over it how little power can reason obtain! These fine intractable spirits appear to be the essence of genius, and beaming in its eagle eye, produce in the most eminent degree the happy energy of associating thoughts that surprise, delight, and instruct. These are the glowing minds that concentrate pictures for their fellow-creatures; forcing them to view with interest the objects reflected from the impassioned imagination, which they passed over in nature.

I must be allowed to explain myself. The generality of people cannot see or feel poetically, they want fancy, and therefore fly from solitude in search of sensible objects; but when an author lends them his eyes they can see as he saw, and be amused by images they could not select, though lying before them.

Education thus only supplies the man of genius with knowledge to give variety and contrast to his associations; but there is an habitual association of ideas, that grows 'with our growth,'[2] which has a great effect on the moral character of mankind; and by which a turn is given to the mind that commonly remains throughout life. So ductile is the understanding, and yet so stubborn, that the associations which depend on adventitious circumstances, during the period that the body takes to arrive at maturity, can seldom be disentangled by reason. One idea calls up another, its old associate, and memory, faithful to the first impressions, particularly when the intellectual powers are not employed to cool our sensations, retraces them with mechanical exactness.

This habitual slavery, to first impressions, has a more baneful effect on the female than the male character, because business and other dry employments of the understanding, tend to deaden the feelings and break associations that do violence to reason. But females, who are made women of when they are mere children, and brought back to childhood when they ought to leave the go-cart forever, have not sufficient strength of mind to efface the superinductions of art that have smothered nature.

Every thing that they see or hear serves to fix impressions, call forth emotions, and associate ideas, that give a sexual character to the mind. False notions of beauty and

---

A Vindication of the Rights of Woman was first published in London in 1792. It was followed in the same year by the second edition, which is the basis for the text printed here.

[1] [Wollstonecraft] I have sometimes, when inclined to laugh at materialists, asked whether, as the most powerful effects in nature are apparently produced by fluids, the magnetic, &c. the passions might not be fine volatile fluids that embraced humanity, keeping the more refractory elementary parts together—or whether they were simply a liquid fire that pervaded the more sluggish materials, giving them life and heat? [Reference is to the views of Newton and the Associationists who posited a pervasive fluid that carried vibrations to the perceiver.]

[2] Alexander Pope, *Essay on Man* II, 136.

delicacy stop the growth of their limbs and produce a sickly soreness, rather than delicacy of organs; and thus weakened by being employed in unfolding instead of examining the first associations, forced on them by every surrounding object, how can they attain the vigour necessary to enable them to throw off their factitious character?—where find strength to recur to reason and rise superior to a system of oppression, that blasts the fair promises of spring? This cruel association of ideas, which every thing conspires to twist into all their habits of thinking, or, to speak with more precision, of feeling, receives new force when they begin to act a little for themselves; for they then perceive that it is only through their address to excite emotions in men, that pleasure and power are to be obtained. Besides, the books professedly written for their instruction, which make the first impression on their minds, all inculcate the same opinions. Educated then in worse than Egyptian bondage, it is unreasonable, as well as cruel, to upbraid them with faults that can scarcely be avoided, unless a degree of native vigour be supposed, that falls to the lot of very few amongst mankind.

For instance, the severest sarcasms have been levelled against the sex, and they have been ridiculed for repeating 'a set of phrases learnt by rote,'[3] when nothing could be more natural, considering the education they receive, and that their 'highest praise is to obey, unargued'[4]—the will of man. If they be not allowed to have reason sufficient to govern their own conduct—why, all they learn—must be learned by rote! And when all their ingenuity is called forth to adjust their dress, 'a passion for a scarlet coat,'[5] is so natural, that it never surprised me; and, allowing Pope's summary of their character to be just, 'that every woman is at heart a rake,'[6] why should they be bitterly censured for seeking a congenial mind, and preferring a rake to a man of sense?

Rakes know how to work on their sensibility, whilst the modest merit of reasonable men has, of course, less effect on their feelings, and they cannot reach the heart by the way of the understanding, because they have few sentiments in common.

It seems a little absurd to expect women to be more reasonable than men in their *likings,* and still to deny them the uncontrouled use of reason. When do men *fall-in-love* with sense? When do they, with their superiour powers and advantages, turn from the person to the mind? And how can they then expect women, who are only taught to observe behaviour, and acquire manners rather than morals, to despise what they have been all their lives labouring to attain? Where are they suddenly to find judgment enough to weigh patiently the sense of an awkward virtuous man, when his manners, of which they are made critical judges, are rebuffing, and his conversation cold and dull, because it does not consist of pretty repartees, or well turned compliments? In order to admire or esteem any thing for a continuance, we must, at least, have our curiosity excited by knowing, in some degree, what we admire; for we are unable to estimate the value of qualities and virtues above our comprehension. Such a respect, when it is felt, may be very sublime; and the confused consciousness of humility may render the dependent creature an interesting object, in some points of view; but human love must have grosser ingredients; and the person very naturally will come in for its share—and, an ample share it mostly has!

Love is, in a great degree, an arbitrary passion, and will reign, like some other stalking mischiefs, by its own authority, without deigning to reason; and it may also be easily distinguished from esteem, the foundation of friendship, because it is often excited by evanescent beauties and graces, though, to give an energy to the sentiment, something more solid must deepen their impression and set the imagination to work, to make the most fair—the first good.

Common passions are excited by common qualities.—Men look for beauty and the simper of good-humoured docility: women are captivated by easy manners; a gentleman-like man seldom fails to please them, and their thirsty ears eagerly drink the insinuating nothings of politeness, whilst they turn from the unintelligible sounds of the charmer—reason, charm he never so wisely. With respect to superficial accomplishments, the rake certainly has the advantage; and of these females can form an opinion, for it is their own ground. Rendered gay and giddy by the whole tenor of their lives, the very aspect of wisdom, or the severe graces of virtue, must have a lugubrious appearance to them; and produce a kind of restraint from which they and love, sportive child, naturally revolt. Without taste, excepting of the lighter kind, for taste is the offspring of judgment, how can they discover that true beauty and grace must arise from the play of the mind? and how can they be expected to relish in a lover what they do not, or very imperfectly, possess themselves? The sympathy that unites hearts, and invites to confidence, in them is so very faint, that it cannot take fire, and thus mount to passion. No, I repeat it, the love cherished by such minds, must have grosser fewel!

The inference is obvious; till women are led to exercise their understandings, they should not be satirized for their attachment to rakes; or even for being rakes at heart, when it appears to be the inevitable consequence of their education. They who live to please—must find their enjoyments, their happiness, in pleasure! It is a trite, yet true remark, that we never do any thing well, unless we love it for its own sake.

[6] Pope, *Moral Essays* II, 215–6.

Supposing, however, for a moment, that women were, in some future revolution of time, to become, what I sincerely wish them to be, even love would acquire more serious dignity, and be purified in its own fires; and virtue giving true delicacy to their affections, they would turn with disgust from a rake. Reasoning then, as well as feeling, the only province of woman, at present, they might easily guard against exteriour graces, and quickly learn to despise the sensibility that had been excited and hackneyed in the ways of women, whose trade was vice; and allurements, wanton airs. They would recollect that the flame, one must use appropriated expressions, which they wished to light up, had been exhausted by lust, and that the sated appetite, losing all relish for pure and simple pleasures, could only be roused by licentious arts or variety. What satisfaction could a woman of delicacy promise herself in a union with such a man, when the very artlessness of her affection might appear insipid? Thus does Dryden describe the situation,

> ———'Where love is duty, on the female side,
> 'On theirs mere sensual gust, and sought with
> surly pride.'[7]

But one grand truth women have yet to learn, though much it imports them to act accordingly. In the choice of a husband, they should not be led astray by the qualities of a lover—for a lover the husband, even supposing him to be wise and virtuous, cannot long remain.

Were women more rationally educated, could they take a more comprehensive view of things, they would be contented to love but once in their lives; and after marriage calmly let passion subside into friendship—into that tender intimacy, which is the best refuge from care; yet is built on such pure, still affections, that idle jealousies would not be allowed to disturb the discharge of the sober duties of life, or to engross the thoughts that ought to be otherwise employed. This is a state in which many men live; but few, very few women. And the difference may easily be accounted for, without recurring to a sexual character. Men, for whom we are told women were made, have too much occupied the thoughts of women; and this association has so entangled love with all their motives of action; and, to harp a little on an old string, having been solely employed either to prepare themselves to excite love, or actually putting their lessons in practice, they cannot live without love. But, when a sense of duty, or fear of shame, obliges them to restrain this pampered desire of pleasing beyond certain lengths, too far for delicacy, it is true, though far from criminality, they obstinately determine to love, I speak of the passion, their husbands to the end of the chapter—and then acting the part which they foolishly exacted from their lovers, they become abject woers, and fond slaves.

Men of wit and fancy are often rakes; and fancy is the food of love. Such men will inspire passion. Half the sex, in its present infantine state, would pine for a Lovelace;[8] a man so witty, so graceful, and so valiant; and can they *deserve* blame for acting according to principles so constantly inculcated? They want a lover, and protector; and behold him kneeling before them—bravery prostrate to beauty! The virtues of a husband are thus thrown by love into the background, and gay hopes, or lively emotions, banish reflection till the day of reckoning comes; and come it surely will, to turn the sprightly lover into a surly suspicious tyrant, who contemptuously insults the very weakness he fostered. Or, supposing the rake reformed, he cannot quickly get rid of old habits. When a man of abilities is first carried away by his passions, it is necessary that sentiment and taste varnish the enormities of vice, and give a zest to brutal indulgences; but when the gloss of novelty is worn off, and pleasure palls upon the sense, lasciviousness becomes barefaced, and enjoyment only the desperate effort of weakness flying from reflection as from a legion of devils. Oh! virtue, thou art not an empty name! All that life can give—thou givest!

If much comfort cannot be expected from the friendship of a reformed rake of superiour abilities, what is the consequence when he lacketh sense, as well as principles? Verily misery, in its most hideous shape. When the habits of weak people are consolidated by time, a reformation is barely possible; and actually makes the beings miserable who have not sufficient mind to be amused by innocent pleasure; like the tradesman who retires from the hurry of business, nature presents to them only a universal blank; and the restless thoughts prey on the damped spirits.[9] Their reformation, as well as his retirement, actually makes them wretched because it deprives them of all employment, by quenching the hopes and fears that set in motion their sluggish minds.

---

[7] John Dryden, *Palamon and Arcite* III, 231–2.

[8] A character in Samuel Richardson's *Clarissa.*

[9] [Wollstonecraft] I have frequently seen this exemplified in women whose beauty could no longer be repaired. They have retired from the noisy scenes of dissipation; but, unless they become methodists, the solitude of the select society of their family connections of acquaintance, has presented only a fearful void; consequently, nervous complaints, and all the vapourish train of idleness, rendered them quite useless, and far more unhappy, than when they joined the giddy throng.

If such be the force of habit; if such be the bondage of folly, how carefully ought we to guard the mind from storing up vicious associations; and equally careful should we be to cultivate the understanding, to save the poor wight from the weak dependent state of even harmless ignorance. For it is the right use of reason alone which makes us independent of every thing—excepting the unclouded Reason—'Whose service is perfect freedom.'

Chapter XIII

Some Instances of the Folly Which the Ignorance of Women Generates; with Concluding Reflections on the Moral Improvement That a Revolution in Female Manners Might Naturally Be Expected to Produce

There are many follies, in some degree, peculiar to women: sins against reason of commission as well as of omission; but all flowing from ignorance or prejudice, I shall only point out such as appear to be particularly injurious to their moral character. And in animadverting on them, I wish especially to prove, that the weakness of mind and body, which men have endeavoured, impelled by various motives, to perpetuate, prevents their discharging the peculiar duty of their sex: for when weakness of body will not permit them to suckle their children, and weakness of mind makes them spoil their tempers—is woman in a natural state?

* * *

Section II

Another instance of that feminine weakness of character, often produced by a confined education, is a romantic twist of the mind, which has been very properly termed *sentimental.*

Women subjected by ignorance to their sensations, and only taught to look for happiness in love, refine on sensual feelings, and adopt metaphysical notions respecting that passion, which lead them shamefully to neglect the duties of life, and frequently in the midst of these sublime refinements they plump into actual vice.

These are the women who are amused by the reveries of the stupid novelists, who, knowing little of human nature, work up stale tales, and describe meretricious scenes, all retailed in a sentimental jargon, which equally tend to corrupt the taste, and draw the heart aside from its daily duties. I do not mention the understanding, because never having been exercised, its slumbering energies rest inactive, like the lurking particles of fire which are supposed universally to pervade matter.

Females, in fact, denied all political privileges, and not allowed, as married women, excepting in criminal cases, a civil existence, have their attention naturally drawn from the interest of the whole community to that of the minute parts, though the private duty of any member of society must be very imperfectly performed when not connected with the general good. The mighty business of female life is to please, and restrained from entering into more important concerns by political and civil oppression, sentiments become events, and reflection deepens what it should, and would have effaced, if the understanding had been allowed to take a wider range.

But, confined to trifling employments, they naturally imbibe opinions which the only kind of reading calculated to interest an innocent frivolous mind, inspires. Unable to grasp any thing great, is it surprising that they find the reading of history a very dry task, and disquisitions addressed to the understanding intolerably tedious, and almost unintelligible? Thus are they necessarily dependent on the novelist for amusement. Yet, when I exclaim against novels, I mean when contrasted with those works which exercise the understanding and regulate the imagination.—For any kind of reading I think better than leaving a blank still a blank, because the mind must receive a degree of enlargement and obtain a little strength by a slight exertion of its thinking powers; besides, even the productions that are only addressed to the imagination, raise the reader a little above the gross gratification of appetites, to which the mind has not given a shade of delicacy.

This observation is the result of experience; for I have known several notable women, and one in particular, who was a very good woman—as good as such a narrow mind would allow her to be, who took care that her daughters (three in number) should never see a novel. As she was a woman of fortune and fashion, they had various masters to attend them, and a sort of menial governess to watch their footsteps. From their masters they learned how tables, chairs, &c. were called in French and Italian; but as the few books thrown in their way were far above their capacities, or devotional, they neither acquired ideas nor sentiments, and passed their time, when not compelled to repeat *words,* in dressing, quarrelling with each other, or conversing with their maids by stealth, till they were brought into company as marriageable.

Their mother, a widow, was busy in the mean time in keeping up her connections, as she termed a numerous acquaintance, lest her girls should want a proper introduction into the great world. And these young ladies, with minds vulgar in every sense of the word, and spoiled tempers, entered life puffed up with notions of their own consequence, and looking down with contempt on those who could not vie with them in dress and parade.

With respect to love, nature, or their nurses, had taken care to teach them the physical meaning of the word; and, as they had few topics of conversation, and fewer refinements of sentiment, they expressed their gross wishes not in very delicate phrases, when they spoke freely, talking of matrimony.

Could these girls have been injured by the perusal of novels? I almost forgot a shade in the character of one of them; she affected a simplicity bordering on folly, and with a simper would utter the most immodest remarks and questions, the full meaning of which she had learned whilst secluded from the world, and afraid to speak in her mother's presence, who governed with a high hand: they were all educated, as she prided herself, in a most exemplary manner; and read their chapters and psalms before breakfast, never touching a silly novel.

This is only one instance; but I recollect many other women who, not led by degrees to proper studies, and not permitted to choose for themselves, have indeed been overgrown children; or have obtained, by mixing in the world, a little of what is termed common sense: that is, a distinct manner of seeing common occurrences, as they stand detached: but what deserves the name of intellect, the power of gaining general or abstract ideas, or even intermediate ones, was out of the question. Their minds were quiescent, and when they were not roused by sensible objects and employments of that kind, they were low-spirited, would cry, or go to sleep.

When, therefore, I advise my sex not to read such flimsy works, it is to induce them to read something superiour; for I coincide in opinion with a sagacious man, who, having a daughter and niece under his care, pursued a very different plan with each.

The niece, who had considerable abilities, had, before she was left to his guardianship, been indulged in desultory reading. Her he endeavoured to lead, and did lead to history and moral essays; but his daughter, whom a fond weak mother had indulged, and who consequently was averse to every thing like application, he allowed to read novels: and used to justify his conduct by saying that if she ever attained a relish for reading them, he should have some foundation to work upon; and that erroneous opinions were better than none at all.

In fact the female mind has been so totally neglected, that knowledge was only to be acquired from this muddy source, till from reading novels some women of superiour talents learned to despise them.

The best method, I believe, that can be adopted to correct a fondness for novels is to ridicule them: not indiscriminately, for then it would have little effect; but, if a judicious person, with some turn for humour, would read several to a young girl, and point out both by tones, and apt comparisons with pathetic incidents and heroic characters in history, how foolishly and ridiculously they caricatured human nature, just opinions might be substituted instead of romantic sentiments.

In one respect, however, the majority of both sexes resemble, and equally shew a want of taste and modesty. Ignorant women, forced to be chaste to preserve their reputation, allow their imagination to revel in the unnatural and meretricious scenes sketched by the novel writers of the day, slighting as insipid the sober dignity and matron graces of history,[10] whilst men carry the same vitiated taste into life, and fly for amusement to the wanton, from the unsophisticated charms of virtue, and the grave respectability of sense.

Besides, the reading of novels makes women, and particularly ladies of fashion, very fond of using strong expressions and superlatives in conversation: and, though the dissipated artificial life which they lead prevents their cherishing any strong legitimate passion, the language of passion in affected tones slips for ever from their glib tongues, and every trifle produces those phosphoric bursts which only mimick in the dark the flame of passion.

---

[10] [Wollstonecraft] I am not alluding to that superiority of mind which leads to the creation of ideal beauty, when he, surveyed with a penetrating eye, appears a tragi-comedy, in which little can be seen to satisfy the heart without the help of fancy.

William Blake

1757–1827

Although Blake's recent reputation and influence have been considerable, his poetry and other writings were virtually unknown in his day. His reputation then was almost entirely as an engraver. He anticipated the interests of a number of Romantic critics who did not know of his work. In *The Marriage of Heaven and Hell* there is a highly condensed myth of the dissociation of reason and imagination similar to Schiller's in his *Letters on the Aesthetic Education of Man* (below, page 461), though Blake pushes the dissociation farther back in time. His notion of the ancient poets as the makers of language has something in common with Vico's (above, page 317). In his discussion of his painting of Chaucer's Canterbury pilgrims there is a germ of a theory of literary archetypes that influenced the work of Northrop Frye (below, page 1136). This interest, which is closely tied to an interest in myth, is developed in a description he wrote of his painting, now lost, called *The Ancient Britons.* The artist's attention to "minute particulars" is the foundation of his argument with Sir Joshua Reynolds in his often severe annotations to Reynolds's *Discourses* (above, page 394).

Blake's distinction between "vision" (which he sometimes calls "allegory addressed to the intellectual powers") and allegory addressed to the "corporeal understanding" arises from his violent distaste for generalized abstraction as the aim of art and is roughly allied to Romantic distinctions between symbolism and allegory. Most of Blake's criticism is immediately concerned with painting, but it is not improper to apply it generally to literature. His own long poems, *The Four Zoas, Milton,* and *Jerusalem,* carry into practice, indeed include a vision of, the artistic activity he advocates in his prose.

Blake raises numerous other issues connected to those already mentioned. He anticipates to some extent Benedetto Croce's argument that intuition and expression are the same and goes even further toward the view that the creative act is unified: "Invention depends altogether upon execution and organization." He objects strenuously to the empiricist notion in Locke (above, page 281), Burke (above, page 335), and Reynolds that we create only by recombining the simple ideas of sense data into new arrangements. This sort of activity he attributes scornfully to the "daughters of memory," identifying "memory" with the mechanical combination of simple ideas. He believes that man does not come into the world a *tabula rasa.* For him, the opinions of Locke, Burke, and Reynolds lead to allegory addressed to the corporeal understanding, the generalized abstractions that disregard particular experience: "What is general nature? Is there such a thing? Strictly speaking, all knowledge is particular." Blake's idea of universality proceeds from identifying microcosm with macrocosm on the principle of synecdoche, a sophistication of what Vico called "poetic logic" (above, page 319) and Cassirer later (below, page 1016) called "mythical thinking."

The standard edition of Blake's writings is *The Complete Poetry and Prose of William Blake,* edited by David V. Erdman, revised edition (1982). The fullest biography is that of G. E. Bentley, Jr., *Stranger from Paradise* (2001). See Northrop Frye, *Fearful Symmetry* (1947) and his "Blake's Treatment of the Archetype," *English Institute Essays* (1950); David V. Erdman, *Blake: Prophet Against Empire* (1954); W. J. T. Mitchell, *Blake's Composite Art* (1978); Morris Eaves, *Blake's Theory of Art* (1982); Nelson Hilton, *Literal Imagination: Blake's Vision of Words* (1983); Robert N. Essick, *William Blake and the Language of Adam* (1989); Hazard Adams, ed., *Critical Essays on William Blake* (1991); Morris Eaves, ed., *The Cambridge Companion to William Blake* (2003).

from
The Marriage of Heaven and Hell

The ancient poets animated all sensible objects with gods or geniuses, calling them by the names and adorning them with the properties of woods, rivers, mountains, lakes, cities, nations, and whatever their enlarged and numerous senses could perceive.

And particularly they studied the genius of each city and country, placing it under its mental deity.

Till a system was formed, which some took advantage of, and enslaved the vulgar by attempting to realize or abstract the mental deities from their objects: thus began priesthood;

Choosing forms of worship from poetic tales.[1]

And at length they pronounced that the gods had ordered such things.

Thus men forgot that all deities reside in the human breast.

from
Letter to Thomas Butts[1]

Allegory addressed to the intellectual powers, while it is altogether hidden from the corporeal understanding, is my definition of the most sublime poetry; it is also somewhat in the same manner defined by Plato.

Annotations to Reynolds' *Discourses*

Malone's Account of Reynolds' Life and Writings

Page III

[Blake] Invention depends altogether upon execution or organization; as that is right or wrong so is the invention perfect or imperfect. Whoever is set to undermine the execution of art is set to destroy art. Michelangelo's[1] art depends on Michelangelo's execution altogether.

Page XVI

> [Reynolds] I proceeded to copy some of those excellent works. I viewed them again and again. . . . In a short time a new taste and new perceptions began to dawn on me. . . . The truth is, that if these works had really been what I expected, they would have contained beauties superficial and alluring, but by no means such as would have enti-

---

The Marriage of Heaven and Hell was composed and engraved sometime between 1790 and 1793. The excerpt is from Plate 11.

[1] This condensed history of human culture can be compared to Vico's treatment of the development of the culture of the "gentes" (above, page 314) and Schiller's discussion of the dissociation of the intuitive from the speculative (below, page 461).

[1] Thomas Butts (c. 1757–1844 or 1846), patron to Blake. See G. E. Bentley, Jr., "Thomas Butts, White Collar Maecinas," *PMLA* LXXI, 5 (December 1956).

Blake's annotations to Reynolds's *Discourses* were made around 1808 in a copy of *The Works of Sir Joshua Reynolds,* second edition (in three volumes, 1798), edited by Edmond Malone. Blake annotated Malone's introduction and the first eight discourses. The complete texts of *Discourse III* and *Discourse IV* appear above, page 394.

[1] Michelangelo Buonarroti (1475–1564), Italian painter, sculptor, and poet.

> tled them to the great reputation which they have so long and so justly obtained.

All this concession is to prove that genius is acquired, as follows in the next page.

Page XVII

> I am now clearly of opinion, that a relish for the higher excellencies of art is an acquired taste, which no man ever possessed without long cultivation, and great labor . . . we are often ashamed of our apparent dullness; as if it were to be expected that our minds, like tinder, should instantly catch fire from the divine spark of Raphael's genius.

A mock.

Page XIX

> How incapable of producing anything of their own, those are, who have spent most of their time in making finished copies, is an observation well known to all who are conversant with our art.

Finished? What does he mean? Niggling without the correct and definite outline? If he means that copying correctly is a hindrance, he is a liar, for that is the only school to the language of art.

Page XCVIII

> But this disposition to abstractions, to generalizing and classification, is the great glory of the human mind.

To generalize is to be an idiot. To particularize is the alone distinction of merit. General knowledges are those knowledges that idiots possess.

Discourse I

Page 14

> But young men have not only this frivolous ambition of being thought masters of execution, inciting them on one hand, but also their natural sloth tempting them on the other.

Execution is the chariot of genius.

Discourse II

Page 32

> How incapable those are of producing anything of their own, who have spent much of their time in making finished copies, is well known to all who are conversant with our art.

This is most false, for no one can ever design till he has learned the language of art by making many finished copies both of nature and art and of whatever comes in his way from earliest childhood. The difference between a bad artist and a good one is: the bad artist seems to copy a great deal. The good one really does copy a great deal.

Page 33

> The great use in copying, if it be at all useful, should seem to be in learning to color; yet even coloring will never be perfectly attained by servilely copying the model before you.

Contemptible: Servile copying is the great merit of copying.

Page 34

> Following these rules, and using these precautions, when you have clearly and distinctly learned in what good coloring consists, you cannot do better than have recourse to nature herself, who is always at hand, and in comparison of whose true splendor the best colored pictures are but faint and feeble.

Nonsense: Every eye sees differently. As the eye, such the object.

Page 35

> Instead of copying the touches of those great masters, copy only their conceptions. . . . Labor to invent on their general principles and way of

> thinking. . . . how a Michelangelo or Raphael[2] would have treated this subject.

General principles again: Unless you consult particulars you cannot even know or see Michelangelo or Raphael or anything else.

> But as mere enthusiasm will carry you but a little way. . . .

Mere enthusiasm is the all in all! Bacon's philosophy has ruined England. Bacon is only Epicurus over again.[3]

Page 37

> Few have been taught to any purpose who have not been their own teachers.

True.

Page 40

> A facility of drawing, like that of playing upon a musical instrument, cannot be acquired but by an infinite number of acts.

True.

Page 48

> The well-grounded painter . . . is contented that all shall be as great as himself who have undergone the same fatigue. . . .

The man who asserts that there is no such thing as softness in art, and that everything in art is definite and determinate, has not been told this by practice, but by inspiration and vision, because vision is determinate and perfect, and he copies that without fatigue, everything being definite and determinate. Softness is produced alone by comparative strength and weakness in the marking out of the forms. I say these principles could never be found out by the study of nature without con- or innate science.

Discourse III

Page 50

> A work of genius is a work "not to be obtained by the invocation of memory and her siren daughters, but by devout prayer to that eternal spirit, who can enrich with all utterance and knowledge and sends out his seraphim with the hallowed fire of his altar to touch and purify the lips of whom he pleases."
>
> MILTON

The following discourse is particularly interesting to blockheads, as it endeavors to prove that there is no such thing as inspiration and that any man of a plain understanding may by thieving from others become a Michelangelo.

Page 52

> The wish of the genuine painter must be more extensive: instead of endeavoring to amuse mankind with the minute neatness of his imitations, he must endeavor to improve them by the grandeur of his ideas.

Without minute neatness of execution the sublime cannot exist! Grandeur of ideas is founded on precision of ideas.

Page 54

> The moderns are not less convinced than the ancients of this superior power existing in the art; nor less sensible of its effects.

I wish that this was true.

Page 55

> Such is the warmth with which both the ancients and moderns speak of this divine principle of the art;

And such is the coldness with which Reynolds speaks! And such is his enmity.

> . . . enthusiastic admiration seldom promotes knowledge.

---

[2] Raphael Santi (1483–1520), Italian painter.

[3] Sir Francis Bacon (above, page 234). Epicurus (341–270 B.C.), Greek philosopher, founder of Epicureanism.

Enthusiastic admiration is the first principle of knowledge and its last. Now he begins to degrade, to deny and to mock.

> . . . He examines his own mind, and perceives there nothing of that divine inspiration, with which, he is told, so many others have been favored.

The man who on examining his own mind finds nothing of inspiration ought not dare to be an artist; he is a fool and a cunning knave suited to the purposes of evil demons.

Page 56

> He never traveled to heaven to gather new ideas; and he finds himself possessed of no other qualifications than what mere common observation and a plain understanding can confer.

The man who never in his mind and thoughts traveled to heaven is no artist.

Artists who are above a plain understanding are mocked and destroyed by this president of fools.

> But on this, as upon many other occasions, we ought to distinguish how much is to be given to enthusiasm, and how much to reason . . . taking care . . . not to lose . . . that solidity and truth of principle, upon which alone we can reason, and may be enabled to practice.

It is evident that Reynolds wished none but fools to be in the arts and in order to this, he calls all others vague enthusiasts or madmen.

What has reasoning to do with the art of painting?

Page 57

> . . . most people err, not so much from want of capacity to find their object, as from not knowing what object to pursue.

The man who does not know what object to pursue is an idiot.

> This great ideal perfection and beauty are not to be sought in the heavens, but upon the earth.

A lie!

> They are about us, and upon every side of us.

A lie!

> But the power of discovering what is deformed in nature, or in other words, what is particular and uncommon, can be acquired only by experience;

A lie!

Page 58

> . . . and the whole beauty of the art consists, in my opinion, in being able to get above all singular forms, local customs, particularities, and details of every kind.

A folly! Singular and particular detail is the foundation of the sublime.

> All the objects which are exhibited to our view by nature, upon close examination will be found to have their blemishes and defects. The most beautiful forms have something about them like weakness, minuteness, or imperfection.

Minuteness is their whole beauty.

> This idea of the perfect state of nature, which the artist calls the ideal beauty, is the great leading principle by which works of genius are conducted.

Knowledge of ideal beauty is not to be acquired. It is born with us. Innate ideas are in every man, born with him; they are truly himself. The man who says that we have no innate ideas must be a fool and knave, having no conscience or innate science.

Page 60

> Thus it is from a reiterated experience and a close comparison of the objects in nature, that an artist becomes possessed of the idea of that central form . . . from which every deviation is deformity.

One central form composed of all other forms being granted, it does not therefore follow that all other forms are deformity.

All forms are perfect in the poet's mind, but these are not abstracted nor compounded from nature, but are from imagination.

Page 61

> Even the great Bacon treats with ridicule the idea of confusing proportion to rules, or, of producing beauty by selection.

The great Bacon he is called—I call him the little Bacon—says that everything must be done by experiment; his first principle is unbelief, and yet here he says that art must be produced without such method. He is like Sir Joshua, full of self-contradiction and knavery.

> There is a rule, obtained out of general nature, to contradict which is to fall into deformity.

What is general nature? Is there such a thing? What is general knowledge? Is there such a thing? Strictly speaking, all knowledge is particular.

Page 62

> To the principle I have laid down, that the idea of beauty in each species of beings is an invariable one, it may be objected, that in every particular species there are various central forms, which are separate and distinct from each other, and yet are each undeniably beautiful.

Here he loses sight of a central form and gets into many central forms.

Page 63

> It is true, indeed, that these figures are each perfect in their kind, though of different characters and proportions; but still none of them is the representation of an individual, but of a class.

Every class is individual.[4]

> Thus, though the forms of childhood and age differ exceedingly, there is a common form in childhood, and a common form in age, which is the more perfect, as it is more remote from all peculiarities.

There is no end to the follies of this man. Childhood and age are equally belonging to every class.

> . . . though the most perfect forms of each of the general divisions of the human figure are ideal and superior to any individual form of that class, yet the highest perfection of the human figure is not to be found in any one of them. It is not in the *Hercules,* nor in the *Gladiator,* nor in the *Apollo*. . . .

Here he comes again to his central form.

Page 64

> There is, likewise, a kind of symmetry, or proportion, which may properly be said to belong to deformity. A figure lean or corpulent, tall or short, though deviating from beauty, may still have a certain union of the various parts.

The symmetry of deformity is a pretty foolery. Can any man who thinks talk so? Leanness or fatness is not deformity, but Reynolds thought character itself extravagance and deformity. Age and youth are not classes, but properties of each class; so are leanness and fatness.

Page 65

> When the artist has by diligent attention acquired a clear and distinct idea of beauty and symmetry; when he has reduced the variety of nature to the abstract idea. . . .

What folly!

Page 67

> . . . [the painter] must divest himself of all prejudices in favor of his age or country; he must disregard all local and temporary ornaments, and look only on those general habits, which are everywhere and always the same.

---

[4] Here Blake seems to adopt a view like that which Vico attributes to his primitive "giants" and their "poetic logic," above, page 319.

Generalizing in everything, the man would soon be a fool, but a cunning fool.

Page 71

> Albert Dürer, as Vasari[5] has justly remarked, would, probably, have been one of the first painters of his age . . . had he been initiated into those great principles of the art, which were so well understood and practiced by his contemporaries in Italy.

What does this mean, "would have been one of the first painters of his age"? Albert Dürer is, not would have been. Besides, let them look at Gothic figures and Gothic buildings and not talk of Dark Ages or of any age. Ages are all equal. But genius is always above the age.

Page 74

> I should be sorry, if what is here recommended, should be at all understood to countenance a careless or indetermined manner of painting. For though the painter is to overlook the accidental discriminations of nature, he is to exhibit distinctly, and with precision, the general forms of things.

Here he is for determinate and yet for indeterminate. Distinct general form cannot exist. Distinctness is particular, not general.

Page 75

> A firm and determined outline is one of the characteristics of the great style in painting; and let me add, that he who possesses the knowledge of the exact form which every part of nature ought to have, will be fond of expressing that knowledge with correctness and precision in all his works.

A noble sentence! Here is a sentence, which overthrows all his book.

> To conclude; I have endeavored to reduce the idea of beauty to general principles. . . .

. . . Bacon's philosophy makes both statesmen and artists fools and knaves.

Discourse IV

Page 78

The two following discourses are particularly calculated for the setting ignorant and vulgar artists as models of execution in art. Let him who will, follow such advice. I will not. I know that the man's execution is as his conception and no better.

Page 79

> The value and rank of every art is in proportion to the mental labor employed in it, or the mental pleasure produced by it.

Why does he not always allow this?

Page 80

> I have formerly observed that perfect form is produced by leaving out particularities, and retaining only general ideas. . . .

General ideas again!

> Invention in painting does not imply the invention of the subject; for that is commonly supplied by the poet or historian.

All but names of persons and places is invention both in poetry and painting.

Page 82

> . . . the usual and most dangerous error is on the side of minuteness, and therefore I think caution most necessary where most have failed.

Here is nonsense.

Page 83

> The general idea constitutes real excellence. All smaller things, however perfect in their way, are to be sacrificed without mercy to the greater.

---

[5] Albrecht Dürer (1471–1528), German painter and engraver; Giorgio Vasari (1511–1574), biographer of artists.

Sacrifice the parts, what becomes of the whole?

> Even in portraits, the grace, and, we may add, the likeness, consists more in taking the general air, than in observing the exact similitude of every feature.

How ignorant!

Page 86

> A painter of portraits retains the individual likeness; a painter of history shows the man by showing his actions.

If he does not show the man as well as the action, he is a poor artist.

Page 106

> A history painter paints man in general; a portrait painter, a particular man, and consequently a defective model.

A history painter paints the hero, and not man in general, but most minutely in particular.

Page 111

> The errors of genius . . . are pardonable, and none even of the more exalted painters are wholly free of them. . . .

Genius has no error; it is ignorance that is error.

Pages 117–18

> If you mean to preserve the most perfect beauty in its most perfect state, you cannot express the passions, all of which produce distortion and deformity, more or less, in the most beautiful faces.

What nonsense!

Passion and expression is beauty itself. The face that is incapable of passion and expression is deformity itself. Let it be painted and patched and praised and advertised forever, it will only be admired by fools.

Page 119

> We can easily, like the ancients, suppose a Jupiter to be possessed of all those powers and perfections which the subordinate deities were endowed with separately. Yet, when they employed their art to represent him, they confined his character to majesty alone.

False: the ancients were chiefly attentive to complicated and minute discrimination of character; it is the whole of art.

Page 120

> [Pliny wrongfully] observes . . . in a statue . . . three different characters.

Reynolds cannot bear expression.

Discourse VI

Page 154

> We may venture to say, that as art shall advance. . . .

If art was progressive we should have had Michelangelos and Raphaels to succeed and to improve upon each other. But it is not so. Genius dies with its possessor and comes not again till another is born with it.[6]

Page 155

> It must of necessity be, that even works of genius, like every other effect, as they must have their cause, must likewise have their rules.

Identities or things are neither cause nor effect. They are eternal.

---

[6] Elsewhere Blake wrote, "To suppose that art can go beyond the finest specimens of art that are now in the world, is not knowing what art is; it is being blind to the gift of the spirit." The attack on art as progressive is shared by most citics after Blake. It is part of an attempt to distinguish art from science. In Blake and the Romantics it begins with the close identification of the individual artist with his work.

Page 157

> . . . our minds should be habituated to the contemplation of excellence; and that, far from being contented to make such habits the discipline of our youth only, we should to the last moment of our lives, continue a settled intercourse with all the true examples of grandeur. Their inventions are not only the food of our infancy, but the substance which supplies the fullest maturity of our vigor.

Reynolds thinks that man learns all that he knows. I say on the contrary that man brings all that he has or can have into the world with him. Man is born like a garden ready planted and sown. This world is too poor to produce one seed.

Page 180

> Men who although thus bound down by the almost invincible powers of early habits, have still exerted extraordinary abilities within their narrow and confined circle; and have, from the natural vigor of their mind, given a very interesting expression and force and energy to their works.

He who can be bound down is no genius. Genius cannot be bound; it may be rendered indignant and outrageous. "Oppression makes the wise man mad" (Solomon).

Discourse VII

Page 188

The purpose of the following discourse is to prove that taste and genius are not of heavenly origin and that all who have supposed that they are so are to be considered as weak-headed fanatics.

The obligations Reynolds has laid on bad artists of all classes will at all times make them his admirers, but most especially for this discourse, in which it is proved that the stupid are born with faculties equal to other men, only they have not cultivated them because they thought it not worth the trouble.

Page 194

> We will allow a poet to express his meaning, when his meaning is not well known to himself, with a certain degree of obscurity, as it is one source of the sublime.

Obscurity is neither the source of the sublime nor of anything else.

> But when, in plain prose, we gravely talk of courting the muse in shady bowers; waiting the call and inspiration of Genius . . . sagaciously observing how much the wild freedom and liberty of imagination is cramped by attention to established rules . . . we generally rest contented with mere words, or at best entertain notions not only groundless but pernicious.

The ancients and the wisest of the moderns were of the opinion that Reynolds condemns and laughs at.

Page 195

> . . . scarce a poet is to be found . . . who preserved a sound mind in a sound body, and continued practicing his profession to the very last, whose latter works are not as replete with the fire of imagination, as those which were produced in his more youthful days.

As replete, but not more replete.

> To understand literally these metaphors or ideas expressed in poetical language, seems to be equally absurd as to conclude . . .

The ancients did not mean to impose when they affirmed their belief in vision and revelation. Plato was in earnest: Milton was in earnest. They believed that God did visit man really and truly and not as Reynolds pretends.

Page 196

> . . . that because painters sometimes represent poets writing from the dictates of a little winged boy or genius, that this same genius really did inform him in a whisper what he was to write; and that he is himself but a mere machine, unconscious of the operations of his own mind.

How very anxious Reynolds is to disprove and condemn spiritual perception!

Page 197

> It is supposed that their poems are intuitive, that under the name of genius great works are produced, and under the name of taste an exact judgment given, without our knowing why, and without our being under the least obligation to reason, precept, or experience.

Who ever said this?

* * *

Page 198

> . . . I am persuaded, that even among those few who may be called thinkers, the prevalent opinion allows less than it ought to the powers of reason. . . .

The artifice of the Epicurean philosophers is to call all other opinions unsolid and unsubstantial than those which are derived from earth.

> We often appear to differ in sentiments from each other, merely from the inaccuracy of terms.

It is not in terms that Reynolds and I disagree. Two contrary opinions can never by any language be made alike. I say, taste and genius are not teachable or acquirable, but are born with us. Reynolds says the contrary.

Page 199

> . . . we are obliged to take words as we find them; all we can do is to distinguish the things to which they are applied.

This is false; the fault is not in words, but in things. Locke's opinions of words and their fallaciousness are artful opinions and fallacious also.[7]

Page 200

> It is the very same taste which relishes a demonstration in geometry, that is pleased with the resemblance of a picture to an original, and touched with the harmony of music.

Demonstration, similitude and harmony are objects of reasoning. Invention, identity and melody are objects of intuition.

Page 201

> Coloring is true when it is naturally adapted to the eye, from brightness, from softness, from harmony, from resemblance; because these agree with their object, nature, and therefore are true; as true as mathematical demonstration. . . .

God forbid that truth should be confined to mathematical demonstration!

> But beside real, there is also apparent truth, or opinion, or prejudice. With regard to real truth, when it is known, the taste which conforms to it, is, and must be, uniform.

He who does not know truth at sight is unworthy of her notice.

> In proportion as these prejudices are known to be generally diffused, or long received, the taste which conforms to them approaches nearer to certainty, and to a sort of resemblance to real science, even where opinions are found to be no better than prejudices.

Here is a great deal to do to prove that all truth is prejudice, for all that is valuable in knowledge is superior to demonstrative science, such as is weighed or measured.

Page 202

> As these prejudices become more narrow, more local, more transitory, this secondary taste becomes more and more fantastical. . . .

And so he thinks he has proved that genius and inspiration are all a hum.

* * *

> We will take it for granted, that reason is something invariable and fixed in the nature of things. . . .

---

[7] See Locke (above, page 289).

Reason, or a ratio of all we have known, is not the same it shall be when we know more; he therefore takes a falsehood for granted to set out with.

Page 203

> . . . we will conclude, that whatever goes under the name of taste, which we can fairly bring under the dominion of reason, must be considered as equally exempt from change.

Now this is supreme fooling.

> The arts would lie open forever to caprice and casualty, if those who are to judge of their excellencies had no settled principles by which they are to regulate their decisions. . . .

He may as well say that if man does not lay down settled principles, the sun will not rise in the morning.

Page 204

> My notion of nature comprehends not only the forms which nature produces, but also the nature and internal fabric and organization, as I may call it, of the human mind and imagination.

Here is a plain confession that he thinks mind and imagination not to be above the mortal and perishing nature. Such is the end of Epicurean or Newtonian philosophy; it is atheism.

Page 208

> This [Poussin's[8] painting of Perseus with Medusa's head] is undoubtedly a subject of great bustle and tumult, and that the first effect of the picture may correspond to the subject, every principle of composition is violated; there is no principal figure, no principal light, no groups. . . . I remember turning from it with disgust. . . .

Reynolds's eye could not bear characteristic coloring or light and shade.

> This conduct of Poussin I hold to be entirely improper to imitate. A picture should please at first sight. . . .

Please whom? Some men cannot see a picture except in a dark corner.

Page 209

> No one can deny, that violent passions will naturally emit harsh and disagreeable tones. . . .

Violent passions emit the real, good and perfect tones.

Page 214

> If it be objected that Rubens[9] judged ill at first in thinking it necessary to make his work so very ornamental, this puts the question upon new ground.

Here it is called ornamental that the Roman and Bolognian schools may be insinuated not to be ornamental.

Page 215

> Nobody will dispute but some of the best of the Roman or Bolognian schools would have produced a more learned and more noble work.

Learned and noble is ornamental.

> This leads us to another important province of taste, that of weighing the value of the different classes of the art, and of estimating them accordingly.

A fool's balance is no criterion because, though it goes down on the heaviest side, we ought to look what he puts into it.

Page 232

> If a European, when he has cut off his beard, and put false hair on his head, or bound up his own natural hair in regular hard knots, as unlike nature as he can possible make it . . . meets a Cherokee Indian, who has . . . laid on with equal care and attention his yellow and red ocher on particular parts of his forehead and cheeks . . . whoever of these two despises the other for this attention to

---

[8] Nicolas Poussin (1594–1665), French painter.

[9] Peter Paul Rubens (1574–1640), Flemish painter.

> the fashion of his country, whichever first feels himself provoked to laugh, is the barbarian.

Excellent!

Page 242

> In the midst of the highest flights of fancy or imagination, reason ought to preside from first to last. . . .

If this is true, it is a devilish foolish thing to be an artist.

Discourse VIII

Page 244

Burke's *Treatise on the Sublime and Beautiful*[10] is founded on the opinions of Newton and Locke; on this treatise Reynolds has grounded many of his assertions in all his discourses. I read Burke's treatise when very young; at the same time I read Locke on human understanding and Bacon's *Advancement of Learning,*[11] on every one of these books I wrote my opinions, and on looking them over find that my notes on Reynolds in this book are exactly similar. I felt the same contempt and abhorrence then that I do now. They mock inspiration and vision. Inspiration and vision was then, and now is, and I hope will always remain, my element, my eternal dwelling place; how can I then hear it condemned without returning scorn for scorn?

The Canterbury Pilgrims[1]

The characters of Chaucer's pilgrims are the characters which compose all ages and nations: as one age falls, another rises, different to mortal sight, but to immortals only the same; for we see the same characters repeated again and again, in animals, vegetables, minerals, and in men; nothing new occurs in identical existence; accident ever varies, substance can never suffer change nor decay.

Of Chaucer's characters, as described in his *Canterbury Tales,* some of the names or titles are altered by time, but the characters themselves forever remain unaltered, and consequently they are the physiognomies or lineaments of universal human life, beyond which nature never steps. Names alter; things never alter. I have known multitudes of those who would have been monks in the age of monkery, who in this deistical age are deists. As Newton numbered the stars, and as Linneus numbered the plants, so Chaucer numbered the classes of men.

from

A Vision of the Last Judgment

The Last Judgment will be when all those are cast away who trouble religion with questions concerning good and evil or eating of the tree of those knowledges or reasonings which hinder the vision of God, turning all into a consuming fire. When imagination, art and science and all intellectual gifts, all the gifts of the Holy Ghost, are looked upon as of no use and only contention remains to man, then the Last Judgment begins, and its vision is seen by the imaginative eye of everyone according to the situation he holds.

The Last Judgment is not fable or allegory, but vision.[1] Fable or allegory are a totally distinct and inferior kind of poetry. Vision or imagination is a representation of what eternally exists, really and unchangeably. Fable or allegory is formed by the daughters of memory. Imagination is surrounded by the daughters of inspiration, who in the aggregate are called Jerusalem. Fable is allegory, but what critics call the fable is vision itself. The Hebrew Bible and the Gospel of Jesus are not allegory, but eternal vision or imagination of all that exists. Note here that fable or allegory is seldom without some vision. *Pilgrim's Progress*[2] is full of it, the Greek poets the same; but allegory and vision ought to be known as two distinct things, and so called for the sake of eternal life. Plato has made Socrates say that poets and prophets do not know or understand what they write or utter; this is a most pernicious falsehood. If they do not, pray, is an inferior kind to be called knowing? Plato confutes himself.

---

[10] Above, page 333. Blake attacks particularly Burke's adoption of the theory of the association of ideas.

[11] See above, page 282, and above, page 235.

Blake's *Descriptive Catalogue* was printed for an exhibition of sixteen of his paintings in London in 1809.

[1] Blake executed a painting and engraving of the procession of pilgrims in Geoffrey Chaucer's (c. 1340–1400) *Canterbury Tales* and discusses it at length in the catalogue for his exhibit of 1809.

A Vision of the Last Judgment, Blake's description of his painting *The Last Judgment,* now lost (though there are other last judgments by Blake), was written in 1910 in a manuscript notebook, known for some time as the Rossetti Manuscript.

[1] Compare this with the definition in the letter to Thomas Butts (above, page 448). The language is different, but the thought is the same.

[2] *The Pilgrim's Progress from This World to That Which Is to Come* by John Bunyan (1628–1688).

The Last Judgment is one of these stupendous visions. I have represented it as I saw it; to different people it appears differently as everything else does; for though on earth things seem permanent, they are less permanent than a shadow, as we all know too well.

The nature of visionary fancy, or imagination, is very little known, and the eternal nature and permanence of its ever-existent images is considered as less permanent than the things of vegetative and generative nature; yet the oak dies as well as the lettuce, but its eternal image and individuality never dies, but renews by its seed; just so the imaginative image returns by the seed of contemplative thought; the writings of the prophets illustrate these conceptions of the visionary fancy by their various sublime and divine images as seen in the worlds of vision.

Friedrich Schiller

1759–1805

Early in his *Letters on the Aesthetic Education of Man* Schiller proposes his own form of what came to be called, in T. S. Eliot's phrase, the "dissociation of sensibility" (below, page 806). Eliot located the bifurcation of man's sensibility into sense and intellect sometime in the seventeenth century. Schiller places it much earlier. Civilization itself brought about a division in man; the intuitive and the speculative understanding withdrew from each other in defensive hostility; imagination and abstraction stood opposed. The division was fully established by the rise of the state and man's subservience to it.

Schiller's aesthetic speculations express the belief that there is a means by which man can regain his freedom from division, and that the means is art, taken in a very broad sense. Schiller is thus interested in determining the nature of art by explaining its value, indeed its use. But he would eschew the word "use," for it implies utilitarian concerns. He is Kantian, but he goes beyond Kant to formulate his own dialectic. Man possesses two fundamental drives, the sensuous drive *(Stofftrieb)* and the formal drive *(Formtrieb).* The former is characterized by the domination of sensation and change: "Man in this state is nothing but a unit of quantity, an occupied moment of time." The formal drive, on the other hand, annuls time and change "in its quest for the abstract, eternal, and absolute." From it emerge laws.

These drives demand reconciliation or transcendence in a higher drive, which Schiller calls the play-drive *(Spieltrieb)* and which he associates with art. In play it should be possible for man to "combine the greatest fullness of existence with the highest autonomy and freedom." Play, as in Kant's connection of play with art, is in Schiller nothing trivial. It is the expression of man's fullest nature in aesthetic experience, the healing of division. Schiller describes it much as Kant describes aesthetic "disinterest" and "purposiveness without purpose" (above, page 419). In play the mind is free and self-contained, dominated neither by "sense" nor by "form." By indentifying the experiencing of art with freedom Schiller makes huge claims for its cultural value. "Man is more than a match for any of nature's terrors once he knows how to give it form and convert it into an object of his contemplation." Schiller's theory of play thus goes beyond Mazzoni's notion of recreation (above, page 216) and tends to make an ethical principle out of the Kantian aesthetic.

Schiller's most famous theoretical work in addition to the *Letters* is the essay *On Naive and Sentimental Poetry* (1795–1796), in which he speculates on the differences between early and later, more sophisticated poetry in Western culture. The essay represents a concern with the problem of art's relation to the state of culture at a given time. Schiller sought to defend the reflective or "sentimental" poetry of his age in light of a new cultural situation.

Schiller's criticism and writings on aesthetics are in *The Works of Schiller,* edited by N. H. Dole (1902). *Letters on the Aesthetic Education of Man* have been translated by Reginald Snell (1954) and by E. M. Wilkinson and L. A. Willoughby (1967).

Schiller's essays have been edited by Walter Handerer and Daniel O. Dahlstrom (1993). See Victor Basch, *La Poetique de Schiller* (1911); E. C. Welm, *The Philosophy of Schiller in Its Historical Relations* (1912); Frederic Ewen, *The Prestige of Schiller in England 1788–1859* (1932); George Lukacs, "Schiller's Theorie der modernen Literatur," *Goethe und seine Zeit* (1947); Wilham Witte, *Schiller* (1949); Eva Schaper, "Friedrich Schiller: Adventures of a Kantian," *British Journal of Aesthetics* IV (1964), 348–62; Emil Staiger, *Friedrich Schiller* (1967); Ronald Duncan Miller, *Schiller and the Ideal of Freedom* (1970); John Simons, *Friedrich Schiller* (1981); Leonard P. Kain, *Schiller, Hegel, and Marx* (1982); Lesley Sharpe, *Friedrich Schiller: Drama, Thought, and Politics* (1991); Constantin Behler, *Nostalgic Teleology: Friedrich Schiller and the Schemata of Aesthetic Humanism* (1995).

Letters on the Aesthetic Education of Man

from

Sixth Letter

Closer attention to the character of our age will . . . reveal an astonishing contrast between contemporary forms of humanity and earlier ones, especially the Greek. The reputation for culture and refinement, on which we otherwise rightly pride ourselves *vis-à-vis* humanity in its merely natural state, can avail us nothing against the natural humanity of the Greeks. For they were wedded to all the delights of art and all the dignity of wisdom, without however, like us, falling a prey to their seduction. The Greeks put us to shame not only by a simplicity to which our age is a stranger; they are at the same time our rivals, indeed often our models, in those very excellences with which we are wont to console ourselves for the unnaturalness of our manners. In fullness of form no less than of content, at once philosophic and creative, sensitive and energetic, the Greeks combined the first youth of imagination with the manhood of reason in a glorious manifestation of humanity.

At that first fair awakening of the powers of the mind, sense and intellect did not as yet rule over strictly separate domains; for no dissension had as yet provoked them into hostile partition and mutual demarcation of their frontiers. Poetry had not as yet coquetted with wit, nor speculation prostituted itself to sophistry. Both of them could, when need arose, exchange functions, since each in its own fashion paid honor to truth. However high the mind might soar, it always drew matter lovingly along with it; and however fine and sharp the distinctions it might make, it never proceeded to mutilate. It did indeed divide human nature into its several aspects, and project these in magnified form into the divinities of its glorious pantheon; but not by tearing it to pieces; rather by combining its aspects in different proportions, for in no single one of their deities was humanity in its entirety ever lacking. How different with us moderns! With us too the image of the human species is projected in magnified form into separate individuals—but as fragments, not in different combinations, with the result that one has to go the rounds from one individual to another in order to be able to piece together a complete image of the species. With us, one might almost be tempted to assert, the various faculties appear as separate in practice as they are distinguished by the psychologist in theory, and we see not merely individuals, but whole classes of men, developing but one part of their potentialities, while of the rest, as in stunted growths, only vestigial traces remain.

I do not underrate the advantages which the human race today, considered as a whole and weighed in the balance of intellect, can boast in the face of what is best in the ancient world. But it has to take up the challenge in serried ranks, and let whole measure itself against whole. What individual modern could sally forth and engage, man against man, with an individual Athenian for the prize of humanity?

Whence this disadvantage among individuals when the species as a whole is at such an advantage? Why was the individual Greek qualified to be the representative of his age, and why can no single modern venture as much? Because it was from all-unifying nature that the former, and from the all-dividing intellect that the latter, received their respective forms.

Schiller's *Briefe überdie asthetische Erziehung des Menschen* was first published in 1795. The text is from *On the Aesthetic Education of Man in a Series of Letters,* edited and translated by E. M. Wilkinson and L. A. Willoughby (Oxford: The Clarendon Press, 1967).

It was civilization itself which inflicted this wound upon modern man. Once the increase of empirical knowledge, and more exact modes of thought, made sharper divisions between the sciences inevitable, and once the increasingly complex machinery of state necessitated a more rigorous separation of ranks and occupations, then the inner unity of human nature was severed too, and a disastrous conflict set its harmonious powers at variance. The intuitive and the speculative understanding now withdrew in hostility to take up positions in their respective fields, whose frontiers they now began to guard with jealous mistrust; and with this confining of our activity to a particular sphere we have given ourselves a master within, who not infrequently ends by suppressing the rest of our potentialities. While in the one a riotous imagination ravages the hard-won fruits of the intellect, in another the spirit of abstraction stifles the fire at which the heart should have warmed itself and the imagination been kindled.

This disorganization, which was first started within man by civilization and learning, was made complete and universal by the new spirit of government. It was scarcely to be expected that the simple organization of the early republics should have survived the simplicity of early manners and conditions; but instead of rising to a higher form of organic existence it degenerated into a crude and clumsy mechanism. That polypoid character of the Greek states, in which every individual enjoyed an independent existence but could, when need arose, grow into the whole organism, now made way for an ingenious clockwork, in which, out of the piecing together of innumerable but lifeless parts, a mechanical kind of collective life ensued. State and church, law and customs, were now torn asunder; enjoyment was divorced from labor, the means from the end, the effort from the reward. Everlastingly chained to a single little fragment of the whole, man himself develops into nothing but a fragment; everlastingly in his ear the monotonous sound of the wheel that he turns, he never develops the harmony of his being, and instead of putting the stamp of humanity upon his own nature, he becomes nothing more than the imprint of his occupation or of his specialized knowledge. But even that meager, fragmentary participation, by which individual members of the state are still linked to the whole, does not depend upon forms which they spontaneously prescribe for themselves (for how could one entrust to their freedom of action a mechanism so intricate and so fearful of light and enlightenment?); it is dictated to them with meticulous exactitude by means of a formulary which inhibits all freedom of thought. The dead letter takes the place of living understanding, and a good memory is a safer guide than imagination and feeling.

Twelfth Letter

Towards the accomplishment of this twofold task—of giving reality to the necessity within, and subjecting to the law of necessity of reality without—we are impelled by two opposing forces which, since they drive us to the realization of their object, may aptly be termed drives. The first of these, which I will call the sensuous drive, proceeds from the physical existence of man, or his sensuous nature. Its business is to set him within the limits of time, and to turn him into matter—not to provide him with matter, since that, of course, would presuppose a free activity of the person capable of receiving such matter, and distinguishing it from the self as from that which persists. By matter in this context we understand nothing more than change, or reality which occupies time. Consequently this drive demands that there shall be change, that time shall have a content. This state, which is nothing but time occupied by content, is called sensation, and it is through this alone that physical existence makes itself known.

Since everything that exists in time exists as a succession, the very fact of something existing at all means that everything else is excluded. When we strike a note on an instrument, only this single note, of all those it is capable of emitting, is actually realized; when man is sensible of the present, the whole infinitude of his possible determinations is confined to this single mode of his being. Wherever, therefore, this drive functions exclusively, we inevitably find the highest degree of limitation. Man in this state is nothing but a unit of quantity, an occupied moment of time—or rather, he is not at all, for his personality is suspended as long as he is ruled by sensation, and swept along by the flux of time.[1]

The domain of this drive embraces the whole extent of man's finite being. And since form is never made manifest except in some material, nor the absolute except through the medium of limitation, it is indeed to this sensuous drive that the whole of man's phenomenal existence is ultimately tied. But although it is this drive alone which awakens and develops the potentialities of man, it is also this drive alone which makes their complete fulfillment impossible. With indestructible chains it binds the ever-soaring spirit to the world of sense, and summons abstraction from its most unfettered excursions into the infinite back to the limitations of the present. Thought may indeed escape it for the moment, and a firm will triumphantly resist its demands; but suppressed nature soon resumes her rights, and presses for reality of existence, for some content to our knowing and some purpose for our doing.

---

[1] [Schiller] For this condition of self-loss under the dominion of feeling linguistic usage has the very appropriate expression: to be beside oneself, i.e., to be outside of one's own self. Although this turn of phrase is only used when sensation is intensified into passion, and the condition becomes more marked by being prolonged, it can nevertheless be said that everyone is beside himself as long as he does nothing but feel. To return from this condition to self-possession is termed, equally aptly: to be oneself again, i.e., to return into one's own self, to restore one's person. Of someone who has fainted, by contrast, we do not say that he is beside himself, but that he is away from himself, i.e., he has been rapt away from his self, whereas in the former case he is merely not in his self. Consequently, someone who has come out of a faint has merely come to himself, which state is perfectly compatible with being beside oneself.

The second of the two drives, which we may call the formal drive, proceeds from the absolute existence of man, or from his rational nature, and is intent on giving him the freedom to bring harmony into the diversity of his manifestations, and to affirm his person among all his changes of condition. Since this person, being an absolute and indivisible unity, can never be at variance with itself, since we are to all eternity we ourselves, that drive which insists on affirming the personality can never demand anything but that which is binding upon it to all eternity; hence it decides forever as it decides for this moment, and commands for this moment what it commands forever. Consequently it embraces the whole sequence of time, which is as much as to say: it annuls time and annuls change. It wants the real to be necessary and eternal, and the eternal and the necessary to be real. In other words, it insists on truth and on the right.

If the first drive only furnishes cases, this second one gives laws—laws for every judgment, where it is a question of knowledge, laws for every will, where it is a question of action. Whether it is a case of knowing an object, i.e., of attributing objective validity to a condition of our subject, or of acting upon knowledge, i.e., of making an objective principle the determining motive of our condition—in both cases we wrest this our condition from the jurisdiction of time, and endow it with reality for all men and all times, that is with universality and necessity. Feeling can only say: this is true for this individual and at this moment, and another moment, another individual can come along and revoke assertions made thus under the impact of momentary sensation. But once thought pronounces: that is, it decides forever and aye, and the validity of its verdict is guaranteed by the personality itself, which defies all change. Inclination can only say: this is good for you as an individual and for your present need; but your individuality and your present need will be swept away by change, and what you now so ardently desire will one day become the object of your aversion. But once the moral feeling says: this shall be, it decides forever and aye—once you confess truth because it is truth, and practice justice because it is justice, then you have made an individual case into a law for all cases, and treated one moment of your life as if it were eternity.

Where, then, the formal drive holds sway, and the pure object acts within us, we experience the greatest enlargement of being: all limitations disappear, and from the mere unit of quantity to which the poverty of his senses reduced him, man has raised himself to a unity of ideas embracing the whole realm of phenomena. During this operation we are no longer in time; time, with its whole never-ending succession, is in us. We are no longer individuals; we are species. The judgment of all minds is expressed through our own, the choice of all hearts is represented by our action.

Thirteenth Letter

At first sight nothing could seem more diametrically opposed than the tendencies of these two drives, the one pressing for change, the other for changelessness. And yet it is these two drives which, between them, exhaust our concept of humanity, and make a third fundamental drive which might possibly reconcile the two a completely unthinkable concept. How, then, are we to restore the unity of human nature which seems to be utterly destroyed by this primary and radical opposition?

It is true that their tendencies do indeed conflict with each other, but—and this is the point to note—not in the same objectives, and things which never make contact cannot collide. The sensuous drive does indeed demand change; but it does not demand the extension of this to the person and its domain, does not demand a change of principles. The formal drive insists on unity and persistence—but it does not require the condition to be stabilized as well as the person, does not require identity of sensation. The two are, therefore, not by nature opposed; and if they nevertheless seem to be so, it is because they have become opposed through a wanton transgression of nature, through mistaking their nature and function, and confusing their spheres of operation.[2] To watch over these, and secure for each of these two drives its proper frontiers, is the task of culture, which is, therefore, in duty bound to do justice to both drives equally: not simply to maintain the rational against the sensuous, but the sensuous against the rational too. Hence its business is twofold: first, to preserve the life of sense against the encroachments of freedom; and second, to secure the personality against the forces of sensation. The former it achieves by developing our capacity for feeling, the latter by developing our capacity for reason.

---

[2] [Schiller] Once you postulate a primary, and therefore necessary, antagonism between these two drives, there is, of course, no other means of maintaining unity in man than by unconditionally subordinating the sensuous drive to the rational. From this, however, only uniformity can result, never harmony, and man goes on forever being divided. Subordination there must, of course, be; but it must be reciprocal. For even though it is true that limitation can never be the source of the absolute, and hence freedom never be dependent upon time, it is no less certain that the absolute can of itself never be the source of limitation, or a condition in time be dependent upon freedom. Both principles are, therefore, at once subordinated to each other and coordinated with each

Since the world is extension in time, i.e., change, the perfection of that faculty which connects man with the world will have to consist in maximum changeability and maximum extensity. Since the person is persistence within change, the perfection of that faculty which is to oppose change will have to be maximum autonomy and maximum intensity. The more facets his receptivity develops, the more labile it is, and the more surface it presents to phenomena, so much more world does man apprehend, and all the more potentialities does he develop in himself. The more power and depth the personality achieves, and the more freedom reason attains, so much more world does man comprehend, and all the more form does he create outside of himself. His education will therefore consist, firstly, in procuring for the receptive faculty the most manifold contracts with the world, and, within the purview of feeling, intensifying passivity to the utmost; secondly, in securing for the determining faculty the highest degree of independence from the receptive, and, within the purview of reason, intensifying activity to the utmost. Where both these aptitudes are conjoined, man will combine the greatest fullness of existence with the highest autonomy and freedom, and instead of losing himself to the world, will rather draw the latter into himself in all its infinitude of phenomena, and subject it to the unity of his reason.

But man can turn these relations upside down, and thus miss his destiny in two different ways. He can transfer the intensity required by the active function to the passive, let his sensuous drive encroach upon the formal, and make the receptive faculty do the work of the determining one. Or he can assign to the active function that extensity which is proper to the passive, let the formal drive encroach upon the sensuous, and substitute the determining faculty for the receptive one. In the first case he will never be himself; in the second he will never be anything else; and for that very reason, therefore, he will in both cases be neither the one nor the other, consequently—a nonentity.[3]

---

other, that is to say, they stand in reciprocal relation to one another: without form no matter, and without matter no form. (This concept of reciprocal action, and its fundamental importance, is admirably set forth in Fichte's *Fundaments of the Theory of Knowledge*, Leipzig, 1794.) How things stand with the person in the realm of ideas we frankly do not know; but that it can never become manifest in the realm of time without taking on matter, of that we are certain. In this realm, therefore, matter will have some say, and not merely in a role subordinate to form, but also coordinate with it and independently of it. Necessary as it may be, therefore, that feeling should have no say in the realm of reason, it is no less necessary that reason should not presume to have a say in the realm of feeling. Just by assigning to each of them its own sphere, we are by that very fact excluding the other from it, and setting bounds to each, bounds which can only be transgressed at the risk of detriment to both.

In the transcendental method of philosophizing, where everything depends on clearing form of content, and obtaining necessity in its pure state, free of all admixture with the contingent, one easily falls into thinking of material things as nothing but an obstacle, and of imagining that our sensuous nature, just because it happens to be a hindrance in this operation, must of necessity be in conflict with reason. Such a way of thinking is, it is true, wholly alien to the spirit of the Kantian system, but it may very well be found in the letter of it.

[3] [Schiller] The pernicious effect, upon both thought and action, of an undue surrender to our sensual nature will be evident to all. Not quite so evident, although just as common, and no less important, is the nefarious influence exerted upon our knowledge and upon our conduct by a preponderance of rationality. Permit me therefore to recall, from the great number of relevant instances, just two which may serve to throw light upon the damage caused when the functions of thought and will encroach upon those of intuition and feeling.

One of the chief reasons why our natural sciences make such slow progress is obviously the universal, and almost uncontrollable, propensity to teleological judgments, in which, once they are used constitutively, the determining faculty is substituted for the receptive. However strong and however varied the impact made upon our organs by nature, all her manifold variety is then entirely lost upon us, because we are seeking nothing in her but what we have put into her; because, instead of letting her come in upon us, we are thrusting ourselves out upon her with all the impatient anticipations of our reason. If, then, in the course of centuries, it should happen that a man tries to approach her with his sense-organs untroubled, innocent and wide open, and, thanks to this, should chance upon a multitude of phenomena which we, with our tendency to prejudge the issue, have overlooked, then we are mightily astonished that so many eyes in such broad daylight should have noticed nothing. This premature hankering after harmony before we have even got together the individual sounds which are to go to its making, this violent usurping of authority by ratiocination in a field where its right to give orders is by no means unconditional, is the reason why so many thinking minds fail to have any fruitful effect upon the advancement of science; and it would be difficult to say which has done more harm to the progress of knowledge: a sense-faculty unamenable to form, or a reasoning faculty which will not stay for a content.

It would be no less difficult to determine which does more to impede the practice of brotherly love: the violence of our passions, which disturbs it, or the rigidity of our principles, which chills it—the egotism of our senses or the egotism of our reason. If we are to become compassionate, helpful, effective human beings, feeling and character must unite, even as wide-open senses must combine with vigor of intellect if we are to acquire experience. How can we, however laudable our precepts, how can we be just, kindly, and human towards others, if we lack the power of receiving into ourselves, faithfully and truly, natures unlike ours, of feeling our way into the situation of others, of making other people's feelings our own? But in the education we receive, no less than in that we give ourselves, this power gets repressed in exactly the measure that we seek to break the force of passions, and strengthen character by means of principles. Since it costs effort to remain true to one's principles when feeling is easily stirred, we take the easier way out and try to make character secure by blunting feeling; for it is, of course, infinitely easier to have peace and quiet from an adversary you have disarmed than to master a spirited and active foe. And this, for the most part, is the cooperation that is meant when people speak of forming character; and that, even in the best sense of the word, where it implies the cultivation of the inner, and not merely of the outer, man. A man so formed will, without doubt, be immune from the danger of being crude nature or of appearing as such; but he will at the same

For if the sensuous drive becomes the determining one, that is to say, if the senses assume the role of legislator and the world suppresses the person, then the world ceases to be an object precisely to the extent that it becomes a force. From the moment that man is merely a content of time, he ceases to exist, and has in consequence no content either. With his personality his condition, too, is annulled, because these two concepts are reciprocally related—because change demands a principle of permanence, and finite reality an infinite reality. If, on the other hand, the formal drive becomes receptive, that is to say, if thought forestalls feeling and the person supplants the world, then the person ceases to be autonomous force and subject precisely to the extent that it forces its way into the place of the object—because, in order to become manifest, the principle of permanence requires change, and absolute reality has need of limitation. From the moment that man is only form, he ceases to have a form; the annulling of his condition, consequently, involves that of his person too. In a single word, only inasmuch as he is autonomous, is there reality outside him and is he receptive to it; and only inasmuch as he is receptive, is there reality within him and is he a thinking force.

Both drives, therefore, need to have limits set to them and, inasmuch as they can be thought of as energies, need to be relaxed; the sense-drive so that it does not encroach upon the domain of law, the formal drive so that it does not encroach on that of feeling. But the relaxing of the sense-drive must in no wise be the result of physical impotence or blunted feeling, which never merits anything but contempt. It must be an act of free choice, an activity of the person which, by its intensity, moderates that of the senses and, by mastering impressions, robs them of their depth only in order to give them increased surface. It is character which must set bounds to temperament, for it is only to profit the mind that sense may go short. In the same way the relaxing of the formal drive must not be the result of spiritual impotence or flabbiness of thought or will; for this would only degrade man. It must, if it is to be at all praiseworthy, spring from abundance of feeling and sensation. Sense herself must, with triumphant power, remain mistress of her own domain, and resist the violence which the mind, by its usurping tactics, would fain inflict upon her. In a single word: Personality must keep the sensuous drive within its proper bounds, and receptivity, or nature, must do the same with the formal drive.

Fourteenth Letter

We have now been led to the notion of a reciprocal action between the two drives, reciprocal action of such a kind that the activity of the one both gives rise to, and sets limits to, the activity of the other, and in which each in itself achieves its highest manifestation precisely by reason of the other being active.

Such reciprocal relation between the two drives is, admittedly, but a task enjoined upon us by reason, a problem which man is only capable of solving completely in the perfect consummation of his existence. It is, in the most precise sense of the word, the idea of his human nature, hence something infinite, to which in the course of time he can approximate ever more closely, but without ever being able to reach it. "He is not to strive for form at the cost of reality, nor for reality at the cost of form; rather is he to seek absolute being by means of a determinate being, and a determinate being by means of infinite being. He is to set up a world over against himself because he is person, and he is to be person because a world stands over against him. He is to feel because he is conscious of himself, and be conscious of himself because he feels."—That he does actually conform to this idea, that he is consequently, in the fullest sense of the word, a human being, is never brought home to him as long as he satisfies only one of these two drives to the exclusion of the other, or only satisfies them one after the other. For as long as he only feels, his person, or his absolute existence, remains a mystery to him; and as long as he only thinks, his existence in time, or his condition, does likewise. Should there, however, be cases in which he were to have this two-fold experience simultaneously, in which he were to be at once conscious of his freedom and sensible of his existence, were, at one and the same time, to feel himself matter and come to know himself as mind, then he would in such cases, and in such cases only, have a complete intuition of his human nature, and the object which afforded him this vision would become for him a symbol of his accomplished destiny and, in consequence (since that is only to be attained in the totality of time), serve him as a manifestation of the infinite.

---

time be armored by principle against all natural feeling, and be equally inaccessible to the claims of humanity from without as he is to those of humanity from within.

It is a most pernicious abuse of the ideal of perfection, to apply it in all its rigor, either in our judgments of other people, or in those cases where we have to act on their behalf. The former leads to sentimental idealism; the latter to hardness and coldness of heart. We certainly make our duty to society uncommonly easy for ourselves by mentally substituting for the actual man who claims our help the ideal man who could in all probability help himself. Severity with oneself combined with leniency towards others is a sign of the truly excellent character. But mostly the man who is lenient to others will also be lenient with himself; and he who is severe with himself will be the same with others. To be lenient to oneself and severe towards others is the most contemptible character of all.

Assuming that cases of this sort could actually occur in experience, they would awaken in him a new drive which, precisely because the other two drives cooperate within it, would be opposed to each of them considered separately and could justifiably count as a new drive. The sense-drive demands that there shall be change and that time shall have a content; the form-drive demands that time shall be annulled and that there shall be no change. That drive, therefore, in which both the others work in concert (permit me for the time being, until I have justified the term, to call it the play-drive), the play-drive, therefore, would be directed towards annulling time within time, reconciling becoming with absolute being and change with identity.

The sense-drive wants to be determined, wants to receive its object; the form-drive wants itself to determine, wants to bring forth its object. The play-drive, therefore, will endeavor so to receive as if it had itself brought forth, and so to bring forth as the intuitive sense aspires to receive.

The sense-drive excludes from its subject all autonomy and freedom; the form-drive excludes from its subject all dependence, all passivity. Exclusion of freedom, however, implies physical necessity, exclusion of passivity moral necessity. Both drives, therefore, exert constraint upon the psyche; the former through the laws of nature, the latter through the laws of reason. The play-drive, in consequence, as the one in which both the others act in concert, will exert upon the psyche at once a moral and a physical constraint; it will, therefore, since it annuls all contingency, annul all constraint too, and set man free both physically and morally. When we embrace with passion someone who deserves our contempt, we are painfully aware of the compulsion of nature. When we feel hostile towards another who compels our esteem, we are painfully aware of the compulsion of reason. But once he has at the same time engaged our affection and won our esteem, then both the compulsion of feeling and the compulsion of reason disappear and we begin to love him, i.e., we begin to play with both our affection and our esteem.

Since, moreover, the sense-drive exerts a physical, the form-drive a moral constraint, the first will leave our formal, the second our material disposition at the mercy of the contingent; that is to say, it is a matter of chance whether our happiness will coincide with our perfection or our perfection with our happiness. The play-drive, in consequence, in which both work in concert, will make our formal as well as our material disposition, our perfection as well as our happiness, contingent. It will therefore, just because it makes both contingent and because with all constraint all contingency too disappears, abolish contingency in both, and, as a result, introduce form into matter and reality into form. To the extent that it deprives feelings and passions of their dynamic power, it will bring them into harmony with the ideas of reason; and to the extent that it deprives the laws of reason of their moral compulsion, it will reconcile them with the interests of the senses.

Fifteenth Letter

I am drawing ever nearer the goal towards which I have been leading you by a not exactly encouraging path. If you will consent to follow me a few steps further along it, horizons all the wider will unfold and a pleasing prospect perhaps requite you for the labor of the journey.

The object of the sense-drive, expressed in a general concept, we call life, in the widest sense of this term: a concept designating all material being and all that is immediately present to the senses. The object of the form-drive, expressed in a general concept, we call form, both in the figurative and in the literal sense of this word: a concept which includes all the formal qualities of things and all the relations of these to our thinking faculties. The object of the play-drive, represented in a general schema, may therefore be called living form: a concept serving to designate all the aesthetic qualities of phenomena and, in a word, what in the widest sense of the term we call beauty.

According to this explanation, if such it be, the term beauty is neither extended to cover the whole realm of living things nor is it merely confined to this realm. A block of marble, though it is and remains lifeless, can nevertheless, thanks to the architect or the sculptor, become living form; and a human being, though he may live and have form, is far from being on that account a living form. In order to be so, his form would have to be life, and his life form. As long as we merely think about his form, it is lifeless, a mere abstraction; as long as we merely feel his life, it is formless, a mere impression. Only when his form lives in our feeling and his life takes on form in our understanding, does he become living form; and this will always be the case whenever we adjudge him beautiful.

But because we know how to specify the elements which when combined produce beauty, this does not mean that its genesis has as yet in any way been explained; for that would require us to understand the actual manner of their combining, and this, like all reciprocal action between finite and infinite, remains forever inaccessible to our probing. Reason, on transcendental grounds, makes the following demand: Let there be a bond of union between the form-drive and the material drive; that is to say, let there be a play-drive, since only the union of reality with form, contingency with necessity, passivity with freedom, makes the concept of human nature complete. Reason must make this demand because it is reason—because it is its nature to insist on perfection and on the abolition of all limitation, and because any exclusive activity on the part of either the one drive or the other leaves human nature incomplete and gives rise to some limitation within it. Consequently, as soon as reason utters the pronouncement: Let humanity exist, it has by that very pronouncement also promulgated the law: Let there be beauty. Experience can provide an answer to the question whether there is such a thing as beauty, and we shall know the answer once experience has taught us whether there is such a thing as humanity. But how there can be beauty, and how humanity is possible, neither reason nor experience can tell us.

Man, as we know, is neither exclusively matter nor exclusively mind. Beauty, as the consummation of his humanity, can therefore be neither exclusively life nor exclusively form. Not mere life, as acute observers, adhering too closely to the testimony of experience, have maintained, and to which the taste of our age would fain degrade it; not mere form, as it has been adjudged by philosophers whose speculations led them too far away from experience, or by artists who, philosophizing on beauty, let themselves be too exclusively guided by the needs of their craft.[4] It is the object common to both drives, that is to say, the object of the play-drive. This term is fully justified by linguistic usage, which is wont to designate as *play* everything which is neither subjectively nor objectively contingent, and yet imposes no kind of constraint either from within or from without. Since, in contemplation of the beautiful, the psyche finds itself in a happy medium between the realm of law and the sphere of physical exigency, it is, precisely because it is divided between the two, removed from the constraint of the one as of the other. The material drive, like the formal drive, is wholly earnest in its demands; for, in the sphere of knowledge, the former is concerned with the reality, the latter with the necessity of things; while in the sphere of action, the first is directed towards the preservation of life, the second towards the maintenance of dignity: both, therefore, towards truth and towards perfection. But life becomes of less consequence once human dignity enters in, and duty ceases to be a constraint once inclination exerts its pull; similarly our psyche accepts the reality of things, or material truth, with greater freedom and serenity once this latter encounters formal truth, or the law of necessity, and no longer feels constrained by abstraction once this can be accompanied by the immediacy of intuition. In a word: By entering into association with ideas all reality loses its earnestness because it then becomes of small account; and by coinciding with feeling necessity divests itself of its earnestness because it then becomes of light weight.

But, you may long have been tempted to object, is beauty not degraded by being made to consist of mere play and reduced to the level of those frivolous things which have always borne this name? Does it not belie the rational concept as well as the dignity of beauty—which is, after all, here being considered as an instrument of culture—if we limit it to mere play? And does it not belie the empirical concept of play—a concept which is, after all, entirely compatible with the exclusion of all taste—if we limit it merely to beauty?

But how can we speak of mere play, when we know that it is precisely play and play alone, which of all man's states and conditions is the one which makes him whole and unfolds both sides of his nature at once? What you, according to your idea of the matter, call limitation, I, according to mine—which I have justified by proof—call expansion. I, therefore, would prefer to put it exactly the opposite way round and say: the agreeable, the good, the perfect, with these man is merely in earnest; but with beauty he plays. True, we must not think here of the various forms of play which are in vogue in actual life, and are usually directed to very material objects. But then in actual life we should also seek in vain for the kind of beauty with which we are here concerned. The beauty we find in actual existence is precisely what the play-drive we find in actual existence deserves; but with the ideal of beauty that is set up by reason, an ideal of the play-drive, too, is enjoined upon man, which he must keep before his eyes in all his forms of play.

We shall not go far wrong when trying to discover a man's ideal of beauty if we inquire how he satisfies his play-drive. If at the Olympic Games the peoples of Greece delighted in the bloodless combats of strength, speed, and agility, and in the nobler rivalry of talents, and if the Roman people regaled themselves with the death throes of a vanquished gladiator or of his Libyan opponent, we can, from this single trait, understand why we have to seek the ideal forms of a Venus, a Juno, an Apollo, not in Rome, but in

---

[4] [Schiller] Burke, in his *Philosophical Inquiry into the Origin of Our Ideas of the Sublime and the Beautiful* [above, page 333], makes beauty into mere life. As far as I know, every adherent of dogmatic philosophy, who has ever confessed his belief on this subject, makes it into mere form: among artists, Raphael Mengs, in his *Reflection on Taste in Painting*, not to speak of others. In this, as in everything else, critical philosophy has opened up the way whereby empiricism can be led back to principles, and speculation back to experience.

Greece.[5] Reason, however, declares: The beautiful is to be neither mere life, nor mere form, but living form, i.e., beauty; for it imposes upon man the double law of absolute formality and absolute reality. Consequently reason also makes the pronouncement: With beauty man shall only play, and it is with beauty only that he shall play.

For, to mince matters no longer, man only plays when he is in the fullest sense of the word a human being, and he is only fully a human being when he plays. This proposition, which at the moment may sound like a paradox, will take on both weight and depth of meaning once we have got as far as applying it to the twofold earnestness of duty and of destiny. It will, I promise you, prove capable of bearing the whole edifice of the art of the beautiful, and of the still more difficult art of living. But it is, after all, only in philosophy that the proposition is unexpected; it was long ago alive and operative in the art and in the feeling of the Greeks, the most distinguished exponents of both; only they transferred to Olympus what was meant to be realized on earth. Guided by the truth of that same proposition, they banished from the brow of the blessed gods all the earnestness and effort which furrow the cheeks of mortals, no less than the empty pleasures which preserve the smoothness of a vacuous face; freed those ever-contented beings from the bonds inseparable from every purpose, every duty, every care, and made idleness and indifferency the enviable portion of divinity—merely a more human name for the freest, most sublime state of being. Both the material constraint of natural laws and the spiritual constraint of moral laws were resolved in their higher concept of necessity, which embraced both worlds at once; and it was only out of the perfect union of those two necessities that for them true freedom could proceed. Inspired by this spirit, the Greeks effaced from the features of their ideal physiognomy, together with inclination, every trace of volition too; or rather they made both indiscernible, for they knew how to fuse them in the most intimate union. It is not grace, nor is it yet dignity, which speaks to us from the superb countenance of a Juno Ludovisi; it is neither the one nor the other because it is both at once. While the woman-god demands our veneration, the godlike woman kindles our love; but even as we abandon ourselves in ecstasy to her heavenly grace, her celestial self-sufficiency makes us recoil in terror. The whole figure reposes and dwells in itself, a creation completely self-contained, and, as if existing beyond space, neither yielding nor resisting; here is no force to contend with force, no frailty where temporality might break in. Irresistibly moved and drawn by those former qualities, kept at a distance by these latter, we find ourselves at one and the same time in a state of utter repose and supreme agitation, and there results that wondrous stirring of the heart for which mind has no concept nor speech any name.

Twenty-First Letter

There is, as I observed at the beginning of the last letter, a twofold condition of determinability and a twofold condition of determination. I can now clarify this statement.

The psyche may be said to be determinable simply because it is not determined at all; but it is also determinable inasmuch as it is determined in a way which does not exclude anything, i.e., when the determination it undergoes is of a kind which does not involve limitation. The former is mere indetermination (it is without limits, because it is without reality); the latter is aesthetic determinability (it has no limits, because it embraces all reality).

And the psyche may be said to be determined inasmuch as it is limited at all; but it is also determined inasmuch as it limits itself, by virtue of its own absolute power. It finds itself in the first of these two states whenever it feels; in the second, whenever it thinks. What thought is in respect of determination, therefore, the aesthetic disposition is in respect of determinability; the former is limitation by virtue of the infinite force within it, the latter is negation by virtue of the infinite abundance within it. Even as sensation and thought have one single point of contact—viz. that in both states the psyche is determined, and man is something, either individual or person, to the exclusion of all else—but in all other respects are poles apart: so, in like manner, aesthetic determinability has one single point of contact with mere indetermination—viz., that both exclude any determinate mode of existence—while in all other respects they are to each other as nothing is to everything, hence, utterly and entirely different. If, therefore, the latter—indetermination through sheer absence of determination—was thought of as an empty infinity, then aesthetic freedom of determination, which is its counterpart in reality, must be regarded as an infinity filled with content: an idea which accords completely with the results of the foregoing inquiry.

In the aesthetic state, then, man is naught, if we are thinking of any particular result rather than of the totality of his powers, and considering the absence in him of any specific determination. Hence we must allow that those people are entirely right who declare beauty, and the mood it induces in us, to be completely indifferent and unfruitful as regards either knowledge or character. They are entirely right; for beauty produces no particular result whatsoever, neither for the understanding nor for the will. It accomplishes no particular purpose, neither intellectual nor moral; it discovers no individual truth, helps us to perform no individual duty and is, in short, as unfitted to provide a firm basis for character as to enlighten the understanding. By means of aesthetic culture, therefore, the personal worth of a man, or his dignity, inasmuch as this can depend solely upon himself, remains completely indeterminate; and nothing more is achieved by it than that he is henceforth enabled by the grace of nature to make of himself what he will—that the freedom to be what he ought to be is completely restored to him.

---

[5] [Schiller] If (to confine ourselves to the modern world) we compare horse racing in London, bullfights in Madrid, *spectacles* in the Paris of former days, the gondola races in Venice, animal baiting in Vienna, and the gay attractive life of the Corso in Rome, it will not be difficult to determine the different nuances of taste among these different peoples. However, there is far less uniformity among the amusements of the common people in these different countries than there is among those of the refined classes in those same countries, a fact which it is easy to account for.

But precisely thereby something infinite is achieved. For as soon as we recall that it was precisely of this freedom that he was deprived by the one-sided constraint of nature in the field of sensation and by the exclusive authority of reason in the realm of thought, then we are bound to consider the power which is restored to him in the aesthetic mode as the highest of all bounties, as the gift of humanity itself. True, he possesses this humanity *in potentia* before every determinate condition into which he can conceivably enter. But he loses it in practice with every determinate condition into which he does enter. And if he is to pass into a condition of an opposite nature, this humanity must be restored to him each time anew through the life of the aesthetic.[6]

It is, then, not just poetic license but philosophical truth when we call beauty our second creatress. For although it only offers us the possibility of becoming human beings, and for the rest leaves it to our own free will to decide how far we wish to make this a reality, it does in this resemble our first creatress, nature, which likewise conferred upon us nothing more than the power of becoming human, leaving the use and practice of that power to our own free will and decision.

Twenty-Second Letter

If, then, in one respect the aesthetic mode of the psyche is to be regarded as naught—once, that is, we have an eye to particular and definite effects—it is in another respect to be looked upon as a state of supreme reality, once we have due regard to the absence of all limitation and to the sum total of the powers which are conjointly active within it. One cannot, then, say that those people are wrong either who declare the aesthetic state to be the most fruitful of all in respect of knowledge and morality. They are entirely right; for a disposition of the psyche which contains within it the whole of human nature, must necessarily contain within it *in potentia* every individual manifestation of it too; and a disposition of the psyche which removes all limitations from the totality of human nature must necessarily remove them from every individual manifestation of it as well. Precisely on this account, because it takes under its protection no single one of man's faculties to the exclusion of the others, it favors each and all of them without distinction; and it favors no single one more than another for the simple reason that it is the ground of possibility of them all. Every other way of exercising its functions endows the psyche with some special aptitude—but only at the cost of some special limitation; the aesthetic alone leads to the absence of all limitation. Every other state into which we can enter refers us back to a preceding one, and requires for its termination a subsequent one; the aesthetic alone is a whole in itself, since it comprises within itself all the conditions of both its origin and its continuance. Here alone do we feel reft out of time, and our human nature expresses itself with a purity and integrity, as though it had as yet suffered no impairment through the intervention of external forces.

That which flatters our senses in immediate sensation exposes our susceptible and labile psyche to every impression—but only by rendering us proportionately less fitted for exertion. That which tenses our intellectual powers and invites them to form abstract concepts, strengthens our mind for every sort of resistance—but only by hardening it and depriving us of sensibility in proportion as it fosters greater independence of action. Precisely because of this, the one no less than the other must lead to exhaustion, since material cannot for long dispense with shaping power, nor power with material to be shaped. If, by contrast, we have surrendered to the enjoyment of genuine beauty, we are at such a moment master in equal degree of our passive and of our active powers, and we shall with equal ease turn to seriousness or to play, to repose or to movement, to compliance or to resistance, to the discussions of abstract thought or to the direct contemplation of phenomena.

---

[6] [Schiller] Admittedly the rapidity with which certain types pass from sensation to thought or decision scarcely—if indeed at all—allows them to become aware of the aesthetic mode through which they must in that time necessarily pass. Such natures cannot for any length of time tolerate the state of indetermination, but press impatiently for some result which in the state of aesthetic limitlessness they cannot find. In others, by contrast, who find enjoyment more in the feeling of total capacity than in any single action, the aesthetic state tends to spread itself over a much wider area. Much as the former dread emptiness, just as little are the latter capable of tolerating limitation. I need scarcely say that the former are born for detail and subordinate occupations, the latter, provided they combine this capacity with a sense of reality, destined for wholeness and for great roles.

This lofty equanimity and freedom of the spirit, combined with power and vigor, is the mood in which a genuine work of art should release us, and there is no more certain touchstone of true aesthetic excellence. If, after enjoyment of this kind, we find ourselves disposed to prefer some one particular mode of feeling or action, but unfitted or disinclined for another, this may serve as infallible proof that we have not had a purely aesthetic experience—whether the cause lies in the object or in our own response or, as is almost always the case, in both at once.

Since in actuality no purely aesthetic effect is ever to be met with (for man can never escape his dependence upon conditioning forces), the excellence of a work of art can never consist in anything more than a high approximation to that ideal of aesthetic purity; and whatever the degree of freedom to which it may have been sublimated, we shall still leave it in a particular mood and with some definite bias. The more general the mood and the less limited the bias produced in us by any particular art, or by any particular product of the same, then the nobler that art and the more excellent that product will be. One can test this by considering works from different arts and different works from the same art. We leave a beautiful piece of music with our feeling excited, a beautiful poem with our imagination quickened, a beautiful sculpture or building with our understanding awakened. But should anyone invite us, immediately after a sublime musical experience, to abstract thought; or employ us, immediately after a sublime poetic experience, in some routine business of everyday life; or try, immediately after the contemplation of beautiful paintings or sculptures, to inflame our imagination or surprise our feeling—he would certainly be choosing the wrong moment. The reason for this is that even the most ethereal music has, by virtue of its material, an even greater affinity with the senses than true aesthetic freedom really allows; that even the most successful poem partakes more of the arbitrary and casual play of the imagination, as the medium through which it works, than the inner lawfulness of the truly beautiful really permits; that even the most excellent sculpture—the most excellent, perhaps, most of all—does, by virtue of its conceptual precision, border upon the austerity of science. Nevertheless, the greater the degree of excellence attained by a work in any of these three arts, the more these particular affinities will disappear; and it is an inevitable and natural consequence of their approach to perfection that the various arts, without any displacement of their objective frontiers, tend to become ever more like each other in their effect upon the psyche. Music, at its most sublime, must become sheer form and affect us with the serene power of antiquity. The plastic arts, at their most perfect, must become music and move us by the immediacy of their sensuous presence. Poetry, when most fully developed, must grip us powerfully as music does, but at the same time, like the plastic arts, surround us with serene clarity. This, precisely, is the mark of perfect style in each and every art: that it is able to remove the specific limitations of the art in question without thereby destroying its specific qualities, and through a wise use of its individual peculiarities, is able to confer upon it a more general character.[7]

And it is not just the limitations inherent in the specific character of a particular art that the artist must seek to overcome through his handling of it; it is also the limitations inherent in the particular subject matter he is treating. In a truly successful work of art the contents should effect nothing, the form everything; for only through the form is the whole man affected, through the subject matter, by contrast, only one or other of his functions. Subject matter, then, however sublime and all-embracing it may be, always has a limiting effect upon the spirit, and it is only from form that true aesthetic freedom can be looked for. Herein, then, resides the real secret of the master in any art: that he can make his form consume his material; and the more pretentious, the more seductive this material is in itself, the more it seeks to impose itself upon us, the more highhandedly it thrusts itself forward with effects of its own, or the more the beholder is inclined to get directly involved with it, then the more triumphant the art which forces it back and asserts its own kind of dominion over him. The psyche of the listener or spectator must remain completely free and inviolate; it must go forth from the magic circle of the artist pure and perfect as it came from the hands of the Creator. The most frivolous theme must be so treated that it leaves us ready to proceed directly from it to some matter of the utmost import; the most serious material must be so treated that we remain capable of exchanging it forthwith for the lightest play. Arts which affect the passions, such as tragedy, do not invalidate this: in the first place, they are not entirely free arts since they are enlisted in the service of a particular aim (that of pathos); and in the second, no true connoisseur of art will deny that works even of this class are the more perfect, the more they respect the freedom of the spirit even amid the most violent storms of passion. There does indeed exist a fine art of passion; but a fine passionate art is a contradiction in terms; for the unfailing effect of beauty is freedom from passion. No less self-contradictory is the notion of a fine art which teaches (didactic) or improves (moral);

---

[7] Here Schiller recognizes the differences among the arts (see Lessing, *Laocoön,* page 379), but finds those differences transcended in reception.

for nothing is more at variance with the concept of beauty than the notion of giving the psyche any definite bias.[8]

But it is by no means always a proof of formlessness in the work of art itself if it makes its effect solely through its contents; this may just as often be evidence of a lack of form in him who judges it. If he is either too tensed or too relaxed, if he is used to apprehending either exclusively with the intellect or exclusively with the senses, he will, even in the case of the most successfully realized whole, attend only to the parts, and in the presence of the most beauteous form respond only to the matter. Receptive only to the raw material, he has first to destroy the aesthetic organization of a work before he can take pleasure in it, and laboriously scratch away until he has uncovered all those individual details which the master, with infinite skill, had caused to disappear in the harmony of the whole. The interest he takes in it is quite simply either a moral or a material interest; but what precisely it ought to be, namely aesthetic, that it certainly is not.[9] Such readers will enjoy a serious and moving poem as though it were a sermon, a naive or humorous one as though it were an intoxicating drink. And if they were sufficiently lacking in taste to demand edification of a tragedy or an epic—and were it about the Messiah himself—they will certainly not fail to take exception to a poem in the manner of Anacreon or Catullus.[10]

from
Twenty-Fifth Letter

From being a slave of nature, which he remains as long as he merely feels it, man becomes its lawgiver from the moment he begins to think it. That which hitherto merely dominated him as force, now stands before his eyes as object. Whatsoever is object for him has no power over him; for in order to be object at all, it must be subjected to the power that is his. To the extent that he imparts form to matter, and for precisely as long as he imparts it, he is immune to its effects; for spirit cannot be injured by anything except that which robs it of its freedom, and man gives evidence of his freedom precisely by giving form to that which is formless. Only where sheer mass, ponderous and inchoate, holds sway, its murky contours shifting within uncertain boundaries, can fear find its seat; man is more than a match for any of nature's terrors once he knows how to give it form and convert it into an object of his contemplation. Once he begins to assert his independence in the face of nature as phenomenon, then he also asserts his dignity *vis-à-vis* nature as force, and with noble freedom rises in revolt against his ancient gods. Now they cast off those ghastly masks which were the anguish of his childhood and surprise him with his own image by revealing themselves as projections of his own mind. The monstrous divinity of the Oriental, which rules the world with the blind strength of a beast of prey, shrinks in the imagination of the Greeks into the friendly contours of a human being. The empire of the Titans falls, and infinite force is tamed by infinite form.

But whilst I was merely seeking a way out from the material world and a transition to the world of spirit, my imagination has run away with me and carried me into the very heart of this latter. Beauty, which is what we were out to seek, already lies behind us; we have o'erleapt it completely in passing from mere life directly to pure form and the pure object. But a sudden leap of this kind is contrary to human nature, and in order to keep step with this latter we shall have to turn back once more to the world of sense.

Beauty is, admittedly, the work of free contemplation, and with it we do indeed enter upon the world of ideas—but, it should be emphasized, without therefore leaving behind the world of sense, as is the case when we proceed to knowledge of truth. Truth is the pure product of abstracting from everything which is material and contingent; it is object, pure and unadulterated, in which none of the limitations of the subject may persist, pure autonomous activity without any admixture of passivity. True, even from the highest abstractions, there is a way back to sense; for thought affects our inner life of feeling, and the perception of logical and moral unity passes over into a feeling of sensuous congruence. But when we take such delight in intellectual knowledge, we distinguish very exactly between our perception and our feeling, and look upon the latter as something incidental, which could well be absent without the knowledge therefore ceasing to be knowledge or truth being any the less true. But it would be a vain undertaking to try to clear our perception of beauty of these connections with feeling—which is why it will not do to think of the one as the effect of the other, but is imperative to consider each as being, at the same time and reciprocally, both effect and cause. In the pleasure we take in knowledge we distinguish without difficulty the transition from activity to passivity, and are clearly aware that the first is over when the latter begins. In the delight we take in beauty, by contrast, no such succession of activity and passivity can be discerned; reflection is here so completely interfused with feeling that we imagine that the form is directly apprehended by sense. Beauty, then, is indeed an object for us, because reflection is the condition of our having any sensation of it; but it is at the same time a state of the perceiving subject, because feeling is a condition of our having any perception of it. Thus beauty is indeed form, because we contemplate it; but it is at the same time life, because we feel it. In a word: it is at once a state of our being and an activity we perform.

---

[8] Schiller's aesthetic is concerned with the reader, as is Kant's, but it seeks to overcome the traditional Horatian assumption that the effect of art (if it is on this basis that we are to define art) is properly discussed in terms of its ability to delight and to teach.

[9] The argument here is clearly Kantian. See above, page 416.

[10] Anacreon (fl. c. 521 B.C.), Greek lyric poet; Caius Valerius Catullus (84?–54? B.C.), Roman lyric poet.

And just because it is both these things at once, beauty provides us with triumphant proof that passivity by no means excludes activity, nor matter form, nor limitation infinity—that, in consequence, the moral freedom of man is by no means abrogated through his inevitable dependence upon physical things. Beauty is proof of this and, I must add, she alone can furnish such proof. For since in the enjoyment of truth, or logical unity, feeling is not inevitably and of necessity one with thought, but merely follows incidentally upon it, truth can only offer us proof that sensuousness can follow upon rationality, or vice versa; but not that both exist together, nor that they reciprocally work upon each other, nor that they are absolutely and of necessity to be united. On the contrary, from the fact that feeling is excluded as long as we are thinking, and thinking excluded as long as we are feeling, the incompatibility of our two natures would have to be inferred; and, indeed, analytical philosophers are unable to adduce any better proof that pure reason can in practice be realized in human kind than that this is in fact enjoined upon them. But since in the enjoyment of beauty, or aesthetic unity, an actual union and interchange between matter and form, passivity and activity, momentarily takes place, the compatibility of our two natures, the practicability of the infinite being realized in the finite, hence the possibility of sublimest humanity, is thereby actually proven.

We need, then, no longer feel at a loss for a way which might lead us from our dependence upon sense towards moral freedom, since beauty offers us an instance of the latter being perfectly compatible with the former, an instance of man not needing to flee matter in order to manifest himself as spirit. But if he is already free while still in association with sense, as the fact of beauty teaches, and if freedom is something absolute and supra-sensual, as the very notion of freedom necessarily implies, then there can no longer be any question of how he is to succeed in raising himself from the limited to the absolute, or of how, in his thinking and willing, he is to offer resistance to the life of sense, since this has already happened in beauty. There can, in a single word, no longer be any question of how he is to pass from beauty to truth, since this latter is potentially contained in the former, but only a question of how he is to clear a way for himself from common reality to aesthetic reality, from mere life-serving feelings to feelings of beauty.

Friedrich Schlegel

1772–1829

Friedrich Schlegel was perhaps the leading theorist of German romanticism. Together with his brother August Wilhelm, he edited the important periodical *Athenaeum* from 1798 to 1800. In *Athenaeum* the brothers, with Friedrich Schleiermacher and the poet Novalis (Friedrich von Hardenberg), published a series of fragments, the most important of which were written by Friedrich Schlegel. These, which ranged widely over a variety of thoughts—literary, moral, philosophical, and political—were preceded by the *Lyceum Fragments,* written entirely by Friedrich. These fragments appeared in the *Lyceum der schonen Kunste* (1797) and were widely regarded as the initial expression of Romanticism. A selection appears here under the title *Critical Fragments.* Although the fragments take up many matters, including questions about classicism, perhaps the most important is the attention given to the concepts of wit and irony. The former term is elevated to great heights, for wit is clearly identified with genius and inventive power; yet this can be seen only by a reading of several fragments with their cumulative effect.

Irony is perhaps more important, though always involved dialectically with wit. The section of the essay "On Incomprehensibility" reprinted here is really a commentary or enlargement on two *Lyceum Fragments,* numbers 48 and 108, which are quoted in full in the essay. It is irony that "opposes" wit, always, when successful, intruding a skeptical perspective, in which the writer overcomes the finite limits of his own creativity. Thus the skeptical aspect of irony is actually seen as enabling an advance to a higher level, which, however, reveals human limitation in that the object of knowledge or intellectual desire remains infinite and unattainable. Thus irony can be characterized as both a "divine breath" (42) and a "transcendental buffonery," rising above its own art, virtue, or genius, even as it remains on earth.

Schlegel's critical writings are collected in six volumes by Ernst Behler and Hans Eichner in Friedrich Schlegel, *Kritische Schriften and Fragmente* (1988). Ernst Behler, ed., *Friedrich Schlegel in Zelbstzeugnissen und Bilddocumenten* (1966) documents and discusses Schlegel's life. See Hans Eichner, *Friedrich Schlegel* (1970) for biography, also his *Charakteristiken und Kritiken I (1796–1801)* (1967) for a study of Schlegel's critical theory. See also Benno von Wiese, *Friedrich Schlegel* (1927) and Hans Eichner, "Friedrich Schlegel's Theory of Romantic Poetry," *PMLA* 71 (1956), 1018–41; Victor Lange, "Friedrich Schlegel's Literary Criticism," *Comparative Literature* 7, Fall 1955, 289–305; René Wellek, *A History of Modern Criticism,* 1750–1950 (1955); and Ernst Behler and Roman Struc, eds. and trans., *Dialogue on Poetry and Literary Aphorisms* (1968); Margaret Stoljar, *Athenaeum: A Critical Commentary* (1973); Gary J. Handwerk, *Irony and Ethics in Narrative: From Schlegel to Lacan* (1985); Marike Finlay, *The Romantic Irony of Semiotics: Friedrich Schlegel and the Crisis of Representation* (1988); J. Hillis Miller, "Friedrich Schlegel and the Anti-Ekphrastic Tradition," *Revenge of the Aesthetic,* ed. Michael Clark (2000).

from

Critical Fragments (Lyceum Fragments)

7. My essay on the study of Greek poetry is a mannered prose hymn to the objective quality in poetry. The worst thing about it, it seems to me, is the complete lack of necessary irony; and the best, the confident assumption that poetry is infinitely valuable—as if that were a settled thing.

8. A good preface must be at once the square root and the square of its book.

9. Wit is absolute social feeling, or fragmentary genius.

12. One of two things is usually lacking in the so-called Philosophy of Art: either philosophy or art.

14. In poetry too every whole can be a part and every part really a whole.

18. Novels have a habit of concluding in the same way that the Lord's Prayer begins: with the kingdom of heaven on earth.

20. A classical text must never be entirely comprehensible. But those who are cultivated and who cultivate themselves must always want to learn more from it.

21. Just as a child is only a thing which wants to become a human being, so a poem is only a product of nature which wants to become a work of art.

23. Every good poem must be wholly intentional and wholly instinctive. That is how it becomes ideal.

25. The two main principles of the so-called historical criticism are the Postulate of Vulgarity and the Axiom of the Average. The Postulate of Vulgarity: everything great, good, and beautiful is improbable because it is extraordinary and, at the very least, suspicious. The Axiom of the Average: as we and our surroundings are, so must it have been always and everywhere, because that, after all, is so very natural.

26. Novels are the Socratic dialogues of our time. And this free form has become the refuge of common sense in its flight from pedantry.

27. The critic is a reader who ruminates. Therefore he ought to have more than one stomach.

28. Feeling (for a particular art, science, person, etc.) is divided spirit, is self-restriction: hence a result of self-creation and self-destruction.

30. In modern tragedy, fate is sometimes replaced by God the Father, more often by the devil himself. How is it that this hasn't yet inspired some scholar to formulate a theory of the diabolic genre?

36. Whoever hasn't yet arrived at the clear realization that there might be a greatness existing entirely outside his own sphere and for which he might have absolutely no feeling; whoever hasn't at least felt obscure intimations concerning the approximate location of this greatness in the geography of the human spirit: that person either has no genius in his own sphere, or else he hasn't been educated yet to the niveau of the classic.

37. In order to write well about something, one shouldn't be interested in it any longer. To express an idea with due circumspection, one must have relegated it wholly to one's past; one must no longer be preoccupied with it. As long as the artist is in the process of discovery and inspiration, he is in a state which, as far as communication is concerned, is at the very least intolerant.[1] He wants to blurt out everything, which is a fault of young geniuses or a legitimate prejudice of old bunglers. And so he fails to recognize the value and the dignity of self-restriction, which is after all, for the artist as well as the man, the first and the last, the most necessary and the highest duty. Most necessary because wherever one does not restrict oneself, one is restricted by the world; and that makes one a slave. The highest because one can only restrict oneself at those points and places where one possesses infinite power, self-creation, and self-destruction. Even a friendly conversation which cannot be broken off at any moment, completely arbitrarily, has something intolerant about it. But a writer who can and does talk himself out, who keeps nothing back for himself, and likes to tell everything he knows, is to be pitied. There are only three mistakes to guard against. First: What appears to be unlimited free will, and consequently seems and should seem to be irrational or supra-rational, nonetheless must still at bottom be simply necessary and rational; otherwise the whim becomes willful, becomes intolerant, and self-restriction turns into self-destruction. Second: Don't be in too much of a hurry for self-restriction, but first give rein to self-creation, invention, and inspiration, until you're ready. Third: Don't exaggerate self-restriction.

40. In the sense in which it has been defined and used in Germany, aesthetic is a word which notoriously reveals an equally perfect ignorance of the thing and of the language. Why is it still used?

The *Critical Fragments* first appeared in the *Lyceum* in 1797. They are reprinted in part from Peter Firchow, tr., *Friedrich Schlegel's* Lucinde *and the Fragments* (Minneapolis: University of Minnesota Press, 1971).

[1] This view is only one of many that appears in Romanticism concerning the relation of writer to his art. These include various theories of self-expression, but also a notion of authorial disinterest in, for example, Keats (below, page 536). Such views seem to be the writerly parallel to readerly aesthetic "disinterest" in Kant (above, page 420).

48. Irony is the form of paradox. Paradox is everything simultaneously good and great.

51. To use wit as an instrument for revenge is as shameful as using art as a means for titillating the senses.

52. Instead of description, one occasionally gets in poems a rubric announcing that here something or other should really have been described, but the artist was prevented from doing so and most humbly begs to be excused.

53. In respect to their unity, most modern poems are allegories (mysteries, moralities) or novellas (adventures, intrigues), or a mixture or dilution of these.

54. There are writers who drink the absolute like water; and books in which even the dogs refer to the infinite.

55. A really free and cultivated person ought to be able to attune himself at will to being philosophical or philological, critical or poetical, historical or rhetorical, ancient or modern: quite arbitrarily, just as one tunes an instrument, at any time and to any degree.

56. Wit is logical sociability.

57. If some mystical art lovers who think of every criticism as a dissection and every dissection as a destruction of pleasure were to think logically, then "wow" would be the best criticism of the greatest work of art. To be sure, there are critiques which say nothing more, but only take much longer to say it.

58. Just as mankind prefers a great to a just action, so too the artist wants to ennoble and instruct.

59. Chamfort's pet idea that wit is a substitute for an impossible happiness—a small percentage, as it were, of the unpaid debt on the greatest good for which a bankrupt nature must settle—is not much better than Shaftesbury's[2] idea that wit is the touchstone of truth, or the more vulgar prejudice that moral ennoblement is the highest end of the fine arts. Wit is its own end like virtue, like love and art. This brilliant man felt, so it seems, the infinite value of wit, and since French philosophy is inadequate for an understanding of this, he sought instinctively to join what was best in him to what is first and best in that philosophy. And as a maxim, the thought that the wise man must confront fate always *en état d'épigramme* is beautiful and truly cynical.

60. All the classical poetical genres have now become ridiculous in their rigid purity.

61. Strictly understood, the concept of a scientific poem is quite as absurd as that of a poetical science.

62. We already have so many theories about poetical genres. Why have we no concept of poetical genre? Perhaps then we would have to make do with a single theory of poetical genres.

63. Not art and works of art make the artist, but feeling and inspiration and impulse.

64. There should be a new *Laokoön*[3] to determine the limits of music and philosophy. For a proper appreciation of a number of literary works we still need a theory of grammatical music.

65. Poetry is republican speech: a speech which is its own law and end unto itself, and in which all the parts are free citizens and have the right to vote.[4]

67. In England, wit is at least a profession if not an art. There everything becomes craftsmanlike, and in that island even the *roués* are pedants. So too their *wits:* they introduce an absolute willfulness—whose illusion gives to wit its romantic and piquant quality—into reality and so manage to live wittily. Hence their talent for folly. They die for their principles.

70. People who write books and imagine that their readers are the public and that they must educate it soon arrive at the point not only of despising their so-called public but of hating it. Which leads absolutely nowhere.

73. What is lost in average, good, or even first-rate translations is precisely the best part.

78. Many of the very best novels are compendia, encyclopedias of the whole spiritual life of a brilliant individual. Works which have this quality, even if they are cast in a completely different mold—like *Nathan*[5]—thereby take on a novelistic hue. And every human being who is cultivated and who cultivates himself contains a novel within himself. But it isn't necessary for him to express it and write it out.

80. I'm disappointed in not finding in Kant's family tree of basic concepts the category "almost," a category that has surely accomplished, and spoiled, as much in the world and in literature as any other. In the mind of natural skeptics it colors all other concepts and perceptions.

84. From what the moderns aim at, we learn what poetry should become; from what the ancients have done, what it has to be.

85. Every honest author writes for nobody or everybody. Whoever writes for some particular group does not deserve to be read.

86. The function of criticism, people say, is to educate one's readers! Whoever wants to be educated, let him educate himself. This is rude: but it can't be helped.

---

[2] [Firchow] Anthony Ashley Cooper, Third Earl of Shaftesbury (1671–1713), English moral philosopher and one of the shaping spirits of the eighteenth century.

[3] *Laocoön* by Lessing (above, page 378).

[4] A similar remark is made by Ransom (below, page 953).

[5] Lessing's play, *Nathan de Weise* (1779).

89. Isn't it unnecessary to write more than one novel, unless the artist has become a new man? It's obvious that frequently all the novels of a particular author belong together and in a sense make up only one novel.

90. Wit is an explosion of confined spirit.

91. The ancients are not the Jews, Christians, or English of poetry. They are not an arbitrarily chosen artistic people of God; nor do they have the only true saving aesthetic faith; nor do they have a monopoly on poetry.

93. In the ancients we see the perfected letter of all poetry; in the moderns we see its growing spirit.[6]

96. A good riddle should be witty; otherwise nothing remains once the answer has been found. And there's a charm in having a witty idea which is enigmatic to the point of needing to be solved: only its meaning should be immediately and completely clear as soon as it's been hit upon.

98. The following are universally valid and fundamental laws of written communication: (1) one should have something to communicate; (2) one should have somebody to whom one wants to communicate it; (3) one should really be able to communicate it and share it with somebody, not simply express oneself. Otherwise it would be wiser to keep silent.

99. Whoever isn't completely new himself judges the new as if it were old; and the old seems ever new until one grows old oneself.

100. The poetry of one writer is termed philosophical, of another philological, of a third, rhetorical, etc. But what then is poetical poetry?

103. Many works that are praised for the beauty of their coherence have less unity than a motley heap of ideas simply animated by the ghost of a spirit and aiming at a single purpose. What really holds the latter together is that free and equal fellowship in which, so the wise men assure us, the citizens of the perfect state will live at some future date; it's that unqualifiedly sociable spirit which, as the beau monde maintains, is now to be found only in what is so strangely and almost childishly called the great world. On the other hand, many a work of art whose coherence is never questioned is, as the artist knows quite well himself, not a complete work but a fragment, or one or more fragments, a mass, a plan. But so powerful is the instinct for unity in mankind that the author himself will often bring something to a kind of completion which simply can't be made a whole or a unit; often quite imaginatively and yet completely unnaturally. The worst thing about it is that whatever is draped about the solid, really existent fragments in the attempt to mug up a semblance of unity consists largely of dyed rags. And if these are touched up cleverly and deceptively, and tastefully displayed, then that's all the worse. For then he deceives even the exceptional reader at first, who has a deep feeling for what little real goodness and beauty is still to be found here and there in life and letters. That reader is then forced to make a critical judgment to get at the right perception of it! And no matter how quickly the dissociation takes place, still the first fresh impression is lost.

107. The ancients are masters of poetical abstraction; the moderns are better at poetical speculation.

108. Socratic irony is the only involuntary and yet completely deliberate dissimulation. It is equally impossible to feign it or divulge it. To a person who hasn't got it, it will remain a riddle even after it is openly confessed. It is meant to deceive no one except those who consider it a deception and who either take pleasure in the delightful roguery of making fools of the whole world or else become angry when they get an inkling they themselves might be included. In this sort of irony, everything should be playful and serious, guilelessly open and deeply hidden. It originates in the union of *savoir vivre* and scientific spirit, in the conjunction of a perfectly instinctive and a perfectly conscious philosophy. It contains and arouses a feeling of indissoluble antagonism between the absolute and the relative, between the impossibility and the necessity of complete communication. It is the freest of all licenses, for by its means one transcends oneself; and yet it is also the most lawful, for it is absolutely necessary. It is a very good sign when the harmonious bores are at a loss about how they should react to this continuous self-parody, when they fluctuate endlessly between belief and disbelief until they get dizzy and take what is meant as a joke seriously and what is meant seriously as a joke. For Lessing irony is instict; for Hemsterhuis[7] it is classical study; for Hülsen[8] it arises out of the philosophy of philosophy and surpasses these others by far.

109. Gentle wit, or wit without a barb, is a privilege of poetry which prose can't encroach upon: for only by means of the sharpest focus on a single point can the individual idea gain a kind of wholeness.

112. The analytic writer observes the reader as he is; and accordingly he makes his calculations and sets up his machines in order to make the proper impression on him. The synthetic writer constructs and creates a reader as he should be; he doesn't imagine him calm and dead, but alive

---

[6] Schlegel seems to mediate here between ancients and moderns and between the idea of progress in the arts and the generally modern view (see, for example, Blake, above, page 454) that art does not improve.

[7] François Hemsterhuis (1721–1790), Dutch philosopher.

[8] [Firchow] August Ludwig Hülsen (1765–1810), German philosopher, friend of Fichte and the Schlegel brothers.

and critical. He allows whatever he has created to take shape gradually before the reader's eyes, or else he tempts him to discover it himself. He doesn't try to make any particular impression on him, but enters with him into the sacred relationship of deepest symphilosophy or sympoetry.

115. The whole history of modern poetry is a running commentary on the following brief philosophical text: all art should become science and all science art: poetry and philosophy should be made one.

117. Poetry can only be criticized by way of poetry. A critical judgment of an artistic production has no civil rights in the realm of art if it isn't itself a work of art, either in its substance, as a representation of a necessary impression in the state of becoming, or in the beauty of its form and open tone, like that of the old Roman satires.

118. Isn't everything that is capable of becoming shopworn already twisted or trite to begin with?

121. The simplest and most immediate questions, like Should we criticize Shakespeare's works as art or as nature? and Are epic and tragedy essentially different or not? and Should art deceive or merely seem to do so? are all questions that can't be answered without the deepest consideration and the most erudite history of art.

123. It is thoughtless and immodest presumption to want to learn something about art from philosophy. There are many who start out that way as if they hope to find something new there, since philosophy, after all, can't and shouldn't be able to do more than order the given artistic experiences and the existing artistic principles into a science, and raise the appreciation of art, extend it with the help of a thoroughly learned history of art, and create here as well that logical mood which unites absolute tolerance with absolute rigor.

from
Athenaeum Fragments

12. It has been said of many monarchs that they would have been admirable citizens; only as kings were they failures. Can we say the same of the Bible? Is it also just an admirable everyday book whose only fault is that it should have become the Bible?

68. The only true lover of art is the man who can renounce some of his wishes entirely whenever he finds others completely fulfilled, who can rigorously evaluate even what he loves most, who will, if necessary, submit to explanations, and has a sense for the history of art.

71. People always talk about how an analysis of the beauty of a work of art supposedly disturbs the pleasure of the art lover. Well, the real lover just won't let himself be disturbed!

116. Romantic poetry is a progressive, universal poetry. Its aim isn't merely to reunite all the separate species of poetry and put poetry in touch with philosophy and rhetoric. It tries to and should mix and fuse poetry and prose, inspiration and criticism, the poetry of art and the poetry of nature; and make poetry lively and sociable, and life and society poetical; poeticize wit and fill and saturate the forms of art with every kind of good, solid matter for instruction, and animate them with the pulsations of humor. It embraces everything that is purely poetic, from the greatest systems of art, containing within themselves still further systems, to the sigh, the kiss that the poetizing child breathes forth in artless song. It can so lose itself in what it describes that one might believe it exists only to characterize poetical individuals of all sorts; and yet there still is no form so fit for expressing the entire spirit of an author: so that many artists who started out to write only a novel ended up by providing us with a portrait of themselves. It alone can become, like the epic, a mirror of the whole circumambient world, an image of the age. And it can also—more than any other form—hover at the midpoint between the portrayed and the portrayer, free of all real and ideal self-interest, on the wings of poetic reflection, and can raise that reflection again and again to a higher power, can multiply it in an endless succession of mirrors. It is capable of the highest and most variegated refinement, not only from within outwards, but also from without inwards; capable in that it organizes—for everything that seeks a wholeness in its effects—the parts along similar lines, so that it opens up a perspective upon an infinitely increasing classicism. Romantic poetry is in the arts what wit is in philosophy, and what society and sociability, friendship and love are in life. Other kinds of poetry are finished and are now capable of being fully analyzed. The romantic kind of poetry is still in the state of becoming; that, in fact, is its real essence: that it should forever be becoming and never be perfected. It can be exhausted by no theory and only a divinatory criticism would dare try to characterize its ideal. It alone is infinite, just as it alone is free; and it recognizes as its first commandment that the will of the poet can tolerate no law above itself. The romantic kind of poetry is the only one that is

---

The *Athenaeum Fragments* first appeared in the *Athenaeum* from 1798 to 1800. They are reprinted in part from Peter Firchow, tr., *Friedrich Schlegel's* Lucinde *and the Fragments* (Minneapolis: University of Minnesota Press, 1971).

more than a kind, that is, as it were, poetry itself: for in a certain sense all poetry is or should be romantic.

121. An idea is a concept perfected to the point of irony, an absolute synthesis of absolute antitheses, the continual self-creating interchange of two conflicting thoughts. An ideal is at once idea and fact. If ideals don't have as much individuality for the thinker as the gods of antiquity do for the artist, then any concern with ideas is no more than a boring and laborious game of dice with hollow phrases, or, in the manner of the Chinese bronzes, a brooding contemplation of one's own nose. Nothing is more wretched and contemptible than this sentimental speculation without any object. But one shouldn't call this mysticism, since this beautiful old word is so very useful and indispensable for absolute philosophy, from whose perspective the spirit regards everything as a mystery and a wonder, while from other points of view it would appear theoretically and practically normal. Speculation *en detail* is as rare as abstraction *en gros,* and yet it is these that beget the whole substance of scientific wit, these that are the principles of higher criticism, the highest rungs of spiritual cultivation. The great practical abstraction is what makes the ancients—among whom this was an instinct—actually ancients. In vain did individuals express the ideal of their species completely, if the species themselves, strictly and sharply isolated, weren't freely surrendered, as it were, to their originality. But to transport oneself arbitrarily now into this, now into that sphere, as if into another world, not merely with one's reason and imagination, but with one's whole soul; to freely relinquish first one and then another part of one's being, and confine oneself entirely to a third; to seek and find now in this, now in that individual the be-all and end-all of existence, and intentionally forget everyone else: of this only a mind is capable that contains within itself simultaneously a plurality of minds and a whole system of persons, and in whose inner being the universe which, as they say, should germinate in every monad, has grown to fullness and maturity.

123. Isn't poetry the noblest and worthiest of the arts for this, among other reasons: that in it alone drama becomes possible?

139. From the romantic point of view, even the vagaries of poetry have their value as raw materials and preliminaries for universality, even when they're eccentric and monstrous, provided they have some saving grace, provided they are original.

252. A real aesthetic theory of poetry would begin with the absolute antithesis of the eternally unbridgeable gulf between art and raw beauty. It would describe their struggle and conclude with the perfect harmony of artistic and natural poetry. This is to be found only among the ancients and would in itself constitute nothing but a more elevated history of the spirit of classical poetry. But a philosophy of poetry as such would begin with the independence of beauty, with the proposition that beauty is and should be distinct from truth and morality, and that it has the same rights as these: something that—for those who are able to understand it at all—follows from the proposition I = I. It would waver between the union and the division of philosophy and poetry, between poetry and practice, poetry as such and the genres and kinds of poetry; and it would conclude with their complete union. Its beginning would provide the principles of pure poetics; its middle the theory of the particular, characteristically modern types of poetry: the didactic, the musical, the rhetorical in a higher sense, etc. The keystone would be a philosophy of the novel, the rough outlines of which are contained in Plato's political theory. Of course, to the ephemeral, unenthusiastic dilettantes, who are ignorant of the best poets of all types, this kind of poetics would seem very much like a book of trigonometry to a child who just wants to draw pictures. Only a man who knows or possesses a subject can make use of the philosophy of that subject; only he will be able to understand what that philosophy means and what it's attempting to do. But philosophy can't inoculate someone with experience and sense, or pull them out of a hat—and it shouldn't want to do so. To those who knew it already, philosophy of course brings nothing new; but only through it does it become knowledge and thereby assume a new form.

255. The more poetry becomes science, the more it also becomes art. If poetry is to become art, if the artist is to have a thorough understanding and knowledge of his ends and means, his difficulties and his subjects, then the poet will have to philosophize about his art. If he is to be more than a mere contriver and artisan, if he is to be an expert in his field and understand his fellow citizens in the kingdom of art, then he will have to become a philologist as well.

256. The basic error of sophistic aesthetics is to consider beauty merely as something given, as a psychological phenomenon. Of course, beauty isn't simply the empty thought of something that should be created, but at the same time the thing itself, one of the human spirit's original ways of acting: not simply a necessary fiction, but also a fact, that is, an eternally transcendental one.

304. Philosophy too is the result of two conflicting forces—of poetry and practice. Where these interpenetrate completely and fuse into one, there philosophy comes into being; and when philosophy disintegrates, it becomes mythology or else returns to life. The wisdom of the Greeks was created out of poetry and law. The most sublime philosophy, some few surmise, may once again turn to poetry; and

it is in fact a common occurrence that ordinary people only begin to philosophize according to their own lights after they've stopped living. It seems to me that Schelling's[1] real vocation is to describe better this chemical process of philosophizing, to isolate, wherever possible, its dynamic laws and to separate philosophy—which always must organize and disorganize itself anew—into its living, fundamental forces, and trace these back to their origins. On the other hand, his polemics, particularly his literary critique of philosophy, seem to me to represent a false tendency; and his gift for universality is probably still not sufficiently developed to be able to discover in the philosophy of physics what it seeks.

305. Intention taken to the point of irony and accompanied by the arbitrary illusion of its self-destruction is quite as naive as instinct taken to the point of irony. Just as the naive plays with the contradictions between theory and practice, so the grotesque plays with the wonderful permutations of form and matter, loves the illusion of the random and the strange and, as it were, coquettes with infinite arbitrariness. Humor deals with being and nonbeing, and its true essence is reflection. Hence its closeness to the elegy and to everything transcendental; and hence its arrogance and its bent for the mysticism of wit. Just as genius is necessary to naiveté, so too an earnest, pure beauty is a requisite of humor. Most of all humor likes to hover about the gently and clearly flowing rhapsodies of philosophy or poetry, and abhors cumbersome masses and disconnected parts.

324. All genres are good, says Voltaire,[2] except the one that's boring. But what is the boring genre? It may be bigger than all the rest, and many paths may lead to it. But the shortest probably is when a work itself is unsure of its own proper genre. Did Voltaire never follow this path?

325. Just as Simonides[3] called poetry a talking picture, and painting a mute poem, so might one say that history is philosophy in the state of becoming, and philosophy completed history. But Apollo, who neither speaks nor keeps silent but intimates, no longer is worshipped; and wherever a Muse shows herself, people immediately want to carry her off to be cross-examined. How perversely even Lessing[4] treats this clever Greek's beautiful insight, who perhaps had no opportunity to think of "descriptive poetry,"[5] and who would have considered it quite unnecessary to remember that poetry is spiritual music also, since it would never have occurred to him that the two arts could be separated.

365. Mathematics is, as it were, sensual logic. It relates to philosophy as the material arts, music and sculpture, relate to poetry.

372. In the works of the greatest poets there often breathes the spirit of a different art. Might not this be the case with painters too? Doesn't Michelangelo in a certain sense paint like a sculptor, Raphael like an architect, Correggio like a musician? And surely they aren't for this reason lesser painters than Titian, who was only a painter.[6]

434. Should poetry simply be divided up? Or should it remain one and indivisible? Or fluctuate between division and union? Most of the ways of conceiving a poetical world are still as primitive and childish as the old pre-Copernican ideas of astronomy. The usual classifications of poetry are mere dead pedantry designed for people with limited vision. Whatever somebody is capable of producing, or whatever happens to be in fashion, is the stationary earth at the center of all things. But in the universe of poetry nothing stands still, everything is developing and changing and moving harmoniously; and even the comets obey invariable laws of motion. But until the course of these heavenly bodies can be calculated and their return predicted, the true world system of poetry won't have been discovered.

450. Rousseau's[7] polemic against poetry is really only a bad imitation of Plato. Plato is more against poets than he is against poetry;[8] he thought of philosophy as the most daring dithyramb and the most monodic music. Epicurus[9] is the real enemy of art, for he wants to root out imagination and retain sense only. Spinoza[10] might be viewed as the enemy of poetry in quite a different way: because he demonstrates how far one can get with philosophy and morality unaided by poetry, and because it is very much in the spirit of his system not to isolate poetry.

451. Universality is the successive satiation of all forms and substances. Universality can attain harmony only through the conjunction of poetry and philosophy; and even the greatest, most universal works of isolated poetry and philosophy seem to lack this final synthesis. They come to a stop, still imperfect but close to the goal of harmony. The

from

On Incomprehensibility

In order to facilitate a survey of the whole system of irony, we would like to mention here a few of the choicest kinds. The first and most distinguished of all is coarse irony. It is to be found in the real nature of things and is one of the most widespread of substances; it is properly at home in the history of mankind. Next there is fine or delicate irony; then extra-fine. Scaramouche[1] employs the last type when he seems to be talking amicably and earnestly with someone when really he is only waiting for the chance to give him—while preserving the social amenities—a kick in the behind. This kind of irony is also to be found in poets, as well as straightforward irony, a type that flourishes most purely and originally in old gardens where wonderfully lovely grottoes lure the sensitive friend of nature into their cool wombs only to be-splash him plentifully from all sides with water and thereby wipe him clean of delicacy. Further, dramatic irony; that is, when an author has written three acts, then unexpectedly turns into another man and now has to write the last two acts. Double irony, when two lines of irony run parallel side-by-side without disturbing each other: one for the gallery, the other for the boxes, though a few little sparks may also manage to get behind the scenes. Finally, there is the irony of irony. Generally speaking, the most fundamental irony of irony probably is that even it becomes tiresome if we are always being confronted with it. But what we want this irony to mean in the first place is something that happens in more ways than one. For example, if one speaks of irony without using it, as I have just done; if one speaks of irony ironically without in the process being aware of having fallen into a far more noticeable irony; if one can't disentangle oneself from irony anymore, as seems to be happening in this essay on incomprehensibility; if irony turns into a mannerism and becomes, as it were, ironical about the author; if one has promised to be ironical for some useless book without first having checked one's supply and then having to produce it against one's will, like an actor full of aches and pains; and if irony runs wild and can't be controlled any longer.

What gods will rescue us from all these ironies? The only solution is to find an irony that might be able to swallow up all these big and little ironies and leave no trace of them at all. I must confess that at precisely this moment I feel that mine has a real urge to do just that. But even this would only be a short-term solution. I fear that if I understand correctly what destiny seems to be hinting at, then soon there will arise a new generation of little ironies: for truly the stars augur the fantastic. And even if it should happen that everything were to be peaceful for a long period of time, one still would not be able to put any faith in this seeming calm. Irony is something one simply cannot play games with. It can have incredibly long-lasting aftereffects. I have a suspicion that some of the most conscious artists of earlier times are still carrying on ironically, hundreds of years after their deaths, with their most faithful followers and admirers. Shakespeare has so infinitely many depths, subterfuges, and intentions. Shouldn't he also, then, have had the intention of concealing insidious traps in his works to catch the cleverest artists of posterity, to deceive them and make them believe before they realize what they're doing that they are somewhat like Shakespeare themselves? Surely, he must be in this respect as in so many others much more full of intentions than people usually think.

On Incomprehensibility was first published in the *Athenaeum* in 1800. It is reprinted here in part from Peter Firchow, tr., *Friedrich Schlegel's* Lucinde *and the Fragments* (Minneapolis: University of Minnesota Press, 1971).

William Wordsworth

1770–1850

Wordsworth's Preface to the second edition of *Lyrical Ballads,* a major expression of the spirit of English Romanticism, shifts emphasis from the relationship between poem and reader to that between poet and poem. This is not to say that Wordsworth abandons concern for his reader. Far from it: He is deeply interested in the moral purpose and effect of his work. He considers the poet a teacher not of concepts as in the traditional notion of delight and teaching but of immediate intuitions of nature. Nevertheless, he defines the poem primarily in terms of its author's creative activity. He approaches the idea of a poem by first discussing the idea of a poet: "a man speaking to men: a man, it is true, endowed with more lively sensibility, more enthusiasm and tenderness, who has a greater knowledge of human nature, and a more comprehensive soul, than are supposed to be common among mankind." He goes on to describe the poet as one who is able to be affected more than others by imagining things not immediately present to his perception.

Wordsworth then describes the poem as a result of these powers and activities. It is a "spontaneous overflow of powerful feelings; it takes its origin from emotion recollected in tranquility." Both parts of this statement are important, the second qualifying the first: Wordsworth makes clear that the poem does not simply rush forth at the moment of experience, whatever that might be. Memory and contemplation come into play in its composition. Nevertheless, the emphasis is on the importance of feeling.

This emphasis is present also in Wordsworth's description of the poem's aim: In a poem "the feeling therein developed gives importance to the action and situation, and not the action and situation to the feeling." His view contrasts with Aristotle's raising up of plot over characterization (above, page 55). He seems to have made secondary the Aristotelian concept of the poem as an imitation of an action. The poem is the expression of feeling by means of action. This attitude, apparent in germinal form during the eighteenth century in the work of Young (above, page 347) and in the surge of interest in Longinus (above, page 94), distinguishes between feeling, which allegedly unifies, and the analytic powers, which allegedly dissect and break up experience. Feeling becomes the real basis of imagination, which becomes the power to grasp nature in its totality and to order one's experience.

The Preface is well known for the theory of poetic diction that Wordsworth polemically offers in it. He attacks the popular style of his time, accusing it of employing a "gaudy and inane phraseology" that veils nature rather than revealing its spirit. This argument is partly an outgrowth of Wordsworth's own preference for rural over urban life. It is also part of the revived interest in "ancient" British poetry set in motion in part by Bishop Percy's *Reliques of Ancient English Poetry* (1765), which revived traditional ballads. In Wordsworth's view, simple, concrete language expresses a close relationship to "the permanent forms of nature," which he associates with rural life and rural speech. The hackneyed verbal conventions of eighteenth-century poetry he associates with urban artificiality. Coleridge criticized this theory effectively, though not totally fairly, in his *Biographia Literaria.*

The literary criticism of Wordsworth has been collected by N. C. Smith (1905). Also useful is M. L. Peacock, Jr., *Critical Opinions of William Wordsworth* (1950). The standard edition of the *Poetical Works* is that of Ernest de Selincourt and Helen Darbishire (in four volumes, 1941–1947). See also G. McL. Preface to the Second Edition of *Lyrical Ballads*

The first volume of these poems has already been submitted to general perusal. It was published, as an experiment, which, I hoped, might be of some use to ascertain how far, by fitting to metrical arrangement a selection of the real language of men in a state of vivid sensation, that sort of pleasure and that quantity of pleasure may be imparted, which a poet may rationally endeavor to impart.

I had formed no very inaccurate estimate of the probable effect of those poems: I flattered myself that they who should be pleased with them would read them with more than common pleasure: and, on the other hand, I was well aware, that by those who should dislike them they would be read with more than common dislike. The result has differed from my expectation in this only, that a greater number have been pleased than I ventured to hope I should please.

Several of my friends are anxious for the success of these poems, from a belief that, if the views with which they are composed were indeed realized, a class of poetry would be produced, well adapted to interest mankind permanently, and not unimportant in the quality, and in the multiplicity of its moral relations: and on this account they have advised me to prefix a systematic defense of the theory upon which the poems were written. But I was unwilling to undertake the task, knowing that on this occasion the reader would look coldly upon my arguments, since I might be suspected of having been principally influenced by the selfish and foolish hope of *reasoning* him into an approbation of these particular poems: and I was still more unwilling to undertake the task, because, adequately to display the opinions, and fully to enforce the arguments, would require a space wholly disproportionate to a preface. For, to treat the subject with the clearness and coherence of which it is susceptible, it would be necessary to give a full account of the present state of the public taste in this country, and to determine how far this taste is healthy or depraved; which, again, could not be determined without pointing out in what manner language and the human mind act and react on each other, and without retracing the revolutions, not of literature alone, but likewise of society itself. I have therefore altogether declined to enter regularly upon this defense; yet I am sensible

---

The Preface to the second edition of *Lyrical Ballads* was first published in 1800. Wordsworth subsequently revised it, and the final version appeared in the edition of his poems published in 1849–1850. The text follows that version.

that there would be something like impropriety in abruptly obtruding upon the public, without a few words of introduction, poems so materially different from those upon which general approbation is at present bestowed.

It is supposed, that by the act of writing in verse an author makes a formal engagement that he will gratify certain known habits of association; that he not only thus apprises the reader that certain classes of ideas and expressions will be found in his book, but that others will be carefully excluded. This exponent or symbol held forth by metrical language must in different eras of literature have excited very different expectations: for example, in the age of Catullus, Terence, and Lucretius, and that of Statius or Claudian; and in our own country, in the age of Shakespeare and Beaumont and Fletcher, and that of Donne and Cowley, or Dryden, or Pope.[1] I will not take upon me to determine the exact import of the promise which, by the act of writing in verse, an author in the present day makes to his reader: but it will undoubtedly appear to many persons that I have not fulfilled the terms of an engagement thus voluntarily contracted. They who have been accustomed to the gaudiness and inane phraseology of many modern writers, if they persist in reading this book to its conclusion, will, no doubt, frequently have to struggle with feelings of strangeness and awkwardness: they will look round for poetry, and will be induced to inquire by what species of courtesy these attempts can be permitted to assume that title. I hope therefore the reader will not censure me for attempting to state what I have proposed to myself to perform; and also (as far as the limits of a preface will permit) to explain some of the chief reasons which have determined me in the choice of my purpose: that at least he may be spared any unpleasant feeling of disappointment, and that I myself may be protected from one of the most dishonorable accusations which can be brought against an author; namely, that of an indolence which prevents him from endeavoring to ascertain what is his duty, or, when his duty is ascertained, prevents him from performing it.

The principal object, then, proposed in these poems was to choose incidents and situations from common life, and to relate or describe them, throughout, as far as was possible, in a selection of language really used by men, and, at the same time, to throw over them a certain coloring of imagination, whereby ordinary things should be presented to the mind in an unusual aspect; and further, and above all, to make these incidents and situations interesting by tracing in them, truly though not ostentatiously, the primary laws of our nature: chiefly, as far as regards the manner in which we associate ideas in a state of excitement. Humble and rustic life was generally chosen, because, in that condition, the essential passions of the heart find a better soil in which they can attain their maturity, are less under restraint, and speak a plainer and more emphatic language; because in that condition of life our elementary feelings coexist in a state of greater simplicity, and, consequently, may be more accurately contemplated, and more forcibly communicated; because the manners of rural life germinate from those elementary feelings, and, from the necessary character of rural occupations, are more easily comprehended, and are more durable; and, lastly, because in that condition the passions of men are incorporated with the beautiful and permanent forms of nature. The language, too, of these men has been adopted (purified indeed from what appears to be its real defects, from all lasting and rational causes of dislike or disgust) because such men hourly communicate with the best objects from which the best part of language is originally derived; and because, from their rank in society and the sameness and narrow circle of their intercourse, being less under the influence of social vanity, they convey their feelings and notions in simple and unelaborated expressions. Accordingly, such a language, arising out of repeated experience and regular feelings, is a more permanent, and a far more philosophical language than that which is frequently substituted for it by poets, who think that they are conferring honor upon themselves and their art, in proportion as they separate themselves from the sympathies of men, and indulge in arbitrary and capricious habits of expression, in order to furnish food for fickle tastes, and fickle appetites, of their own creation.[2]

I cannot, however, be insensible to the present outcry against the triviality and meanness, both of thought and language, which some of my contemporaries have occasionally introduced into their metrical compositions; and I acknowledge that this defect, where it exists, is more dishonorable to the writer's own character than false refinement or arbitrary innovation, though I should contend at the same time it is far less pernicious in the sum of its consequences. From such verses the poems in these volumes will be found distinguished at least by one mark of difference, that each of them has a worthy *purpose*. Not that I always began to write with a distinct purpose formally conceived; but habits of meditation have, I trust, so prompted and regulated my feelings, that my descriptions of such objects as strongly excite those feelings will be found to carry along with them a *purpose.* If this opinion be erroneous, I can have little right to the name of a poet. For all good poetry is the spontaneous overflow of powerful feelings: and though this be true, poems to which any value can be attached were never produced on any variety of subjects but by a man who, being possessed of more than usual organic sensibility, had also thought long and deeply. For our continued influxes of feeling are modified and directed by our thoughts, which are indeed the representatives of all our past feelings; and, as by contemplating the relation of these general representatives to each other, we discover what is really important to men, so, by the repetition and continence of this act, our feelings will be connected with important subjects, till at length, if we be originally possessed of much sensibility, such habits of mind will be produced that, by obeying blindly and mechanically the impulses of those habits, we shall describe objects, and utter sentiments, of such a nature, and in such connection with each other, that the understanding of the reader must necessarily be in some degree enlightened, and his affections strengthened and purified.

---

[1] Caius Valerius Catullus (84–54 B.C.), Publius Terence Afer (c. 185–c. 159 B.C.), Titus Lucretius Carus (c. 99–c. 55 B.C.), Publius Popinius Statius (c. 40–c. 96), Claudius Claudianus (d. 408), all Roman writers; William Shakespeare (1565–1616), Francis Beaumont (1584–1616), John Fletcher (1579–1625), all English dramatists; John Donne (1571–1631), Abraham Cowley (1618–1667), English poets; John Dryden (above, page 253), Alexander Pope (above, page 297).

[2] [Wordsworth] It is worthwhile here to observe that the affecting parts of Chaucer are almost always expressed in language pure and universally intelligible even to this day.

It has been said that each of these poems has a purpose. Another circumstance must be mentioned which distinguishes these poems from the popular poetry of the day; it is this, that the feeling therein developed gives importance to the action and situation, and not the action and situation to the feeling.[3]

A sense of false modesty shall not prevent me from asserting that the reader's attention is pointed to this mark of distinction, far less for the sake of these particular poems than from the general importance of the subject. The subject is indeed important! For the human mind is capable of being excited without the application of gross and violent stimulants; and he must have a very faint perception of its beauty and dignity who does know know this, and who does not further know that one being is elevated above another in proportion as he possesses this capability. It has therefore appeared to me that to endeavor to produce or enlarge this capability is one of the best services in which, at any period, a writer can be engaged; but this service, excellent at all times, is especially so at the present day. For a multitude of causes, unknown to former times, are now acting with a combined force to blunt the discriminating powers of the mind, and, unfitting it for all voluntary exertion, to reduce it to a state of almost savage torpor. The most effective of these causes are the great national events which are daily taking place,[4] and the increasing accumulation of men in cities, where the uniformity of their occupations produces a craving for extraordinary incident, which the rapid communication of intelligence hourly gratifies. To this tendency of life and manners the literature and theatrical exhibitions of the country have conformed themselves. The invaluable works of our elder writers, I had almost said the works of Shakespeare and Milton, are driven into neglect by frantic novels,[5] sickly and stupid German tragedies, and deluges of idle and extravagant stories in verse.—When I think upon this degrading thirst after outrageous stimulation, I am almost ashamed to have spoken of the feeble endeavor made in these volumes to counteract it; and, reflecting upon the magnitude of the general evil, I should be oppressed with no dishonorable melancholy, had I not a deep impression of certain inherent and indestructible qualities of the human mind, and likewise of certain powers in the great and permanent objects that act upon it, which are equally inherent and indestructible; and were there not added to this impression a belief that the time is approaching when the evil will be systematically opposed, by men of greater powers, and with far more distinguished success.

Having dwelt thus long on the subjects and aim of these poems, I shall request the reader's permission to apprise him of a few circumstances relating to their *style,* in order, among other reasons, that he may not censure me for not having performed what I never attempted. The reader will find that personifications of abstract ideas rarely occur in these volumes, and are utterly rejected, as an ordinary device to elevate the style, and raise it above prose.[6] My purpose was to imitate, and, as far as possible, to adopt the very language of men; and assuredly such personifications do not make any natural or regular part of that language. They are, indeed, a figure of speech occasionally prompted by passion, and I have made use of them as such; but have endeavored utterly to reject them as a mechanical device of style, or as a family language which writers in meter seem to lay claim to by prescription. I have wished to keep the reader in the company of flesh and blood, persuaded that by so doing I shall interest him. Others who pursue a different track will interest him likewise; I do not interfere with their claim, but wish to prefer a claim of my own. There will also be found in these volumes little of what is usually called poetic diction; as much pains has been taken to avoid it as is ordinarily taken to produce it; this has been done for the reason already alleged, to bring my language near to the language of men; and further, because the pleasure which I have proposed to myself to impart is of a kind very different from that which is supposed by many persons to be the proper object of poetry. Without being culpably particular, I do not know how to give my reader a more exact notion of the style in which it was my wish and intention to write, than by informing him that I have at all times endeavored to look steadily at my subject; consequently there is, I hope, in these poems little falsehood of description, and my ideas are expressed in language fitted to their respective importance. Something must have been gained by this practice, as it is friendly to one property of all good poetry, namely, good sense: but it has necessarily cut me off from a large portion of phrases and figures of speech which from father to son have long been regarded as the common inheritance of poets. I have also thought it expedient to restrict myself still further, having abstained from the use of many expressions, in themselves proper and beautiful, but which have been foolishly repeated by bad poets, till such feelings of disgust are connected with them as it is scarcely possible by any art of association to overpower.

---

[3] In contrast to Aristotle (above, page 55), Wordsworth does not place action (plot) first in importance.

[4] Among these, the war with France.

[5] Wordsworth refers to the popular "gothic" novels of the time.

[6] Here Wordsworth is allied with other writers of the time who denigrate what they call allegory.

If in a poem there should be found a series of lines, or even a single line, in which the language, though naturally arranged, and according to the strict laws of meter, does not differ from that of prose, there is a numerous class of critics, who, when they stumble upon these prosaisms, as they call them, imagine that they have made a notable discovery, and exult over the poet as over a man ignorant of his own profession. Now these men would establish a canon of criticism which the reader will conclude he must utterly reject, if he wishes to be pleased with these volumes. And it would be a most easy task to prove to him that not only the language of a large portion of every good poem, even of the most elevated character, must necessarily, except with reference to the meter, in no respect differ from that of good prose, but likewise that some of the most interesting parts of the best poems will be found to be strictly the language of prose when prose is well written. The truth of this assertion might be demonstrated by innumerable passages from almost all the poetical writings, even of Milton himself. To illustrate the subject in a general manner, I will here adduce a short composition of Gray, who was at the head of those who, by their reasonings, have attempted to widen the space of separation betwixt prose and metrical composition, and was more than any other man curiously elaborate in the structure of his own poetic diction.

In vain to me the smiling mornings shine,
And reddening Phoebus lifts his golden fire:
The birds in vain their amorous descant join,
Or cheerful fields resume their green attire.
These ears, alas! for other notes repine;
A different object do these eyes require;
My lonely anguish melts no heart but mine;
And in my breast the imperfect joys expire;
Yet morning smiles the busy race to cheer,
And new-born pleasure brings to happier men;
The fields to all their wonted tribute bear;
To warm their little loves the birds complain.
I fruitless mourn to him that cannot hear,
And weep the more because I weep in vain.[7]

It will easily be perceived, that the only part of this sonnet which is of any value is the lines printed in italics; it is equally obvious that, except in the rhyme, and in the use of the single word *fruitless* for fruitlessly, which is so far a defect, the language of these lines does in no respect differ from that of prose.

By the foregoing quotation it has been shown that the language of prose may yet be well adapted to poetry; and it was previously asserted that a large portion of the language of every good poem can in no respect differ from that of good prose. We will go further. It may be safely affirmed that there neither is, nor can be, any *essential* difference between the language of prose and metrical composition. We are fond of tracing the resemblance between poetry and painting, and, accordingly, we call them sisters:[8] but where shall we find bonds of connection sufficiently strict to typify the affinity betwixt metrical and prose composition? They both speak by and to the same organs: the bodies in which both of them are clothed may be said to be of the same substance, their affections are kindred, and almost identical, not necessarily differing even in degree; poetry[9] sheds no tears "such as angels weep," but natural and human tears; she can boast of no celestial ichor that distinguishes her vital juices from those of prose; the same human blood circulates through the veins of them both.

If it be affirmed that rhyme and metrical arrangement of themselves constitute a distinction which overturns what has just been said on the strict affinity of metrical language with that of prose, and paves the way for other artificial distinctions which the mind voluntarily admits, I answer that the language of such poetry as is here recommended is, as far as is possible, a selection of the language really spoken by men; that this selection, wherever it is made with true taste and feeling, will of itself form a distinction far greater than would at first be imagined, and will entirely separate the composition from the vulgarity and meanness of ordinary life; and, if meter be superadded thereto, I believe that a dissimilitude will be produced altogether sufficient for the gratification of a rational mind. What other distinction would we have? Whence is it to come? And where is it to exist? Not, surely, where the poet speaks through the mouths of his characters: it cannot be necessary here, either for elevation of style, or any of its supposed ornaments: for, if the poet's subject be judiciously chosen, it will naturally, and upon fit occasion, lead him to passions the language of which, if selected truly and judiciously, must necessarily be dignified and variegated, and alive with metaphors and figures. I forbear to speak of an incongruity which would shock the intelligent reader, should the poet interweave any foreign splendor of his own with that which the passion naturally suggests: it is sufficient to say that such addition is unnecessary. And surely it is more probable that those passages which with propriety abound with metaphors and figures will have their due effect, if, upon other occasions where the passions are of a milder character, the style also be subdued and temperate.

---

[7] Thomas Gray (1716–1771), *Sonnet on the Death of Mr. Richard West.*

[8] The term "sister arts" was widely used in the eighteenth century to denote the relations among the arts of poetry, painting, sculpture, and music.

[9] [Wordsworth] I here use the word *poetry* (though against my own judgment) as opposed to the word *prose*, and synonymous with metrical composition. But much confusion has been introduced into criticism by this contradiction of poetry and prose, instead of the more philosophical one of poetry and matter of fact, or science. The only strict antithesis to prose is meter; nor is this, in truth, a strict antithesis, because lines and passages of meter so naturally occur in writing prose, that it would be scarcely possible to avoid them, even were it desirable.

But as the pleasure which I hope to give by the poems now presented to the reader must depend entirely on just notions upon this subject, and as it is in itself of high importance to our taste and moral feelings, I cannot content myself with these detached remarks. And if, in what I am about to say, it shall appear to some that my labor is unnecessary, and that I am like a man fighting a battle without enemies, such persons may be reminded that, whatever be the language outwardly holden by men, a practical faith in the opinions which I am wishing to establish is almost unknown. If my conclusions are admitted, and carried as far as they must be carried if admitted at all, our judgments concerning the works of the greatest poets both ancient and modern will be far different from what they are at present, both when we praise, and when we censure; and our moral feelings influencing and influenced by these judgments will, I believe, be corrected and purified.

Taking up the subject, then, upon general grounds, let me ask, what is meant by the word *poet?* What is a poet? To whom does he address himself? And what language is to be expected from him?—He is a man speaking to men: a man, it is true, endowed with more lively sensibility, more enthusiasm and tenderness, who has a greater knowledge of human nature, and a more comprehensive soul, than are supposed to be common among mankind; a man pleased with his own passions and volitions, and who rejoices more than other men in the spirit of life that is in him; delighting to contemplate similar volitions and passions as manifested in the goings-on of the universe, and habitually impelled to create them where he does not find them. To these qualities he has added a disposition to be affected more than other men by absent things as if they were present; an ability of conjuring up in himself passions which are indeed far from being the same as those produced by real events, yet (especially in those parts of the general sympathy which are pleasing and delightful) do more nearly resemble the passions produced by real events than anything which, from the motions of their own minds merely, other men are accustomed to feel in themselves—whence, and from practice, he has acquired a greater readiness and power in expressing what he thinks and feels, and especially those thoughts and feelings which, by his own choice, or from the structure of his own mind, arise in him without immediate external excitement.

But whatever portion of this faculty we may suppose even the greatest poet to possess, there cannot be a doubt that the language which it will suggest to him must often, in liveliness and truth, fall short of that which is uttered by men in real life under the actual pressure of those passions, certain shadows of which the poet thus produces, or feels to be produced, in himself.

However exalted a notion we would wish to cherish of the character of a poet, it is obvious that while he describes and imitates passions, his employment is in some degree mechanical, compared with the freedom and power of real and substantial action and suffering. So that it will be the wish of the poet to bring his feelings near to those of the persons whose feelings he describes,—nay, for short spaces of time, perhaps, to let himself slip into an entire delusion, and even confound and identify his own feelings with theirs; modifying only the language which is thus suggested to him by a consideration that he describes for a particular purpose, that of giving pleasure. Here, then, he will apply the principle of selection which has been already insisted upon. He will depend upon this for removing what would otherwise be painful or disgusting in the passion; he will feel that there is no necessity to trick out or to elevate nature; and, the more industriously he applies this principle, the deeper will be his faith that no words which *his* fancy or imagination can suggest will be to be compared with those which are the emanations of reality and truth.

But it may be said by those who do not object to the general spirit of these remarks, that, as it is impossible for the poet to produce upon all occasions language as exquisitely fitted for the passion as that which the real passion itself suggests, it is proper that he should consider himself as in the situation of a translator, who does not scruple to substitute excellencies of another kind for those which are unattainable by him, and endeavors occasionally to surpass his original, in order to make some amends for the general inferiority to which he feels that he must submit. But this would be to encourage idleness and unmanly despair. Further, it is the language of men who speak of what they do not understand: who talk of poetry as of a matter of amusement and idle pleasure; who will converse with us as gravely about a *taste* for poetry, as they express it, as if it were a thing as indifferent as a taste for rope dancing, or Frontiniac or Sherry. Aristotle, I have been told, has said that poetry is the most philosophic of all writing:[10] it is so: its object is truth, not individual and local, but general,[11] and operative; not standing upon external testimony, but carried alive into the heart by passion; truth which is its own testimony, which gives competence and confidence to the tribunal to which it appeals, and receives them from the same tribunal. Poetry is the image of man and nature. The obstacles which stand in the way of the fidelity of the biographer and historian, and of their consequent utility, are incalculably greater than those which are to be encountered by the poet who comprehends the dignity of his art. The poet writes under one restriction only, namely, the necessity of giving immediate pleasure to a human being possessed of that information which may be expected from him, not as a lawyer, a physician, a mariner, an astronomer, or a natural philosopher, but as a man. Except this one restriction, there is no object standing between the poet and the image of things; between this, and the biographer and historian, there are a thousand.

Nor let this necessity of producing immediate pleasure be considered as a degradation of the poet's art. It is far otherwise. It is an acknowledgment of the beauty of the universe, an acknowledgment the more sincere, because not formal, but indirect; it is a task light and easy to him who looks at the world in the spirit of love: further, it is a homage paid to the native and naked dignity of man, to the grand elementary principle of pleasure, by which he knows, and feels, and lives, and moves. We have no sympathy but what is propagated by pleasure: I would not be misunderstood; but wherever we sympathize with pain, it will be found that the sympathy is produced and carried on by subtle combinations with pleasure. We have no knowledge, that is, no general principles drawn from the contemplation of particular facts, but what has been built up by pleasure, and exists in us by pleasure alone. The man of science, the chemist and mathematician, whatever difficulties and disgusts they may have had to struggle with, know and feel this. However painful may be the objects with which the anatomist's knowledge is connected, he feels that his knowledge is pleasure; and where he has no pleasure he has no knowledge. What then does the poet? He considers man and the objects that surround him as acting and reacting upon each other, so as to produce an infinite complexity of pain and pleasure; he considers man in his own nature and in his ordinary life as contemplating this with a certain quantity of immediate knowledge, with certain convictions, intuitions, and deductions, which from habit acquire the quality of intuitions; he considers him as looking upon this complex scene of ideas and sensations, and finding everywhere objects that immediately excite in him sympathies which, from the necessities of his nature, are accompanied by an overbalance of enjoyment.

To this knowledge which all men carry about with them, and to these sympathies in which, without any other discipline than that of our daily life, we are fitted to take delight, the poet principally directs his attention. He considers man and nature as essentially adapted to each other, and the mind of man as naturally the mirror of the fairest and most interesting properties of nature. And thus the poet, prompted by this feeling of pleasure, which accompanies him through the whole course of his studies, converses with general nature, with affections akin to those which, through labor and length of time, the man of science has raised up in himself, by conversing with those particular parts of nature which are the objects of his studies. The knowledge both of the poet and the man of science is pleasure; but the knowledge of the one cleaves to us as a necessary part of our existence, our natural and unalienable inheritance; the other is a personal and individual acquisition, slow to come to us, and by no habitual and direct sympathy connecting us with our fellow beings. The man of science seeks truth as a remote and unknown benefactor; he cherishes and loves it in his solitude: the poet, singing a song in which all human beings join with him, rejoices in the presence of truth as our visible friend and hourly companion. Poetry is the breath and finer spirit of all knowledge; it is the impassioned expression which is in the countenance of all science. Emphatically may it be said of the poet, as Shakespeare hath said of man, "that he looks before and after." He is the rock of defense for human nature; an upholder and preserver, carrying everywhere with him relationship and love. In spite of difference of soil and climate, of language and manners, of laws and customs; in spite of things silently gone out of mind, and things violently destroyed; the poet binds together by passion and knowledge the vast empire of human society, as it is spread over the whole earth, and over all time. The objects of the poet's thoughts are everywhere; though the eyes and senses of man are, it is true, his favorite guides, yet he will follow wheresoever he can find an atmosphere of sensation in which to move his wings. Poetry is the first and last of all knowledge—it is as immortal as the heart of man. If the labors of men of science should ever create any material revolution, direct or indirect, in our condition, and in the impressions which we habitually receive, the poet will sleep then no more than at present; he will be ready to follow the steps of the man of science, not only in those general indirect effects, but he will be at his side, carrying sensation into the midst of the objects of the science itself. The remotest discoveries of the chemist, the botanist, or mineralogist, will be as proper objects of the poet's art as any upon which it can be employed, if the time should ever come when these things shall be familiar to us, and the relations under which they are contemplated by the followers of these respective sciences shall be manifestly and palpably material to us as enjoying and suffering beings. If the time should ever come when what is now called science, thus familiarized to men, shall be ready to put on, as it were, a form of flesh and blood, the poet will lend his divine spirit to aid the transfiguration, and will welcome the being thus produced, as a dear and genuine inmate of the household of man.—It is not, then, to be supposed that anyone who holds that sublime notion of poetry which I have attempted to convey, will break in upon the sanctity and truth of his pictures by transitory and accidental ornaments, and endeavor to excite admiration of himself by arts the necessity of which must manifestly depend upon the assumed meanness of his subject.[12]

---

[10] Aristotle (*Poetics*, above, page 57) says that poetry is more philosophical than history on the ground that history addresses particulars and poetry universals.

[11] Wordworth's use of "general" here rather than "universal" indicates the influence of Locke's empiricism (above, page 281).

What has been thus far said applies to poetry in general, but especially to those parts of composition where the poet speaks through the mouths of his characters; and upon this point it appears to authorize the conclusion that there are few persons of good sense who would not allow that the dramatic parts of composition are defective, in proportion as they deviate from the real language of nature, and are colored by a diction of the poet's own, either peculiar to him as an individual poet or belonging simply to poets in general; to a body of men who, from the circumstance of their compositions being in meter, it is expected will employ a particular language.

It is not, then, in the dramatic parts of composition that we look for this distinction of language; but still it may be proper and necessary where the poet speaks to us in his own person and character. To this I answer by referring the reader to the description before given of a poet. Among the qualities there enumerated as principally conducing to form a poet, is implied nothing differing in kind from other men, but only in degree. The sum of what was said is, that the poet is chiefly distinguished from other men by a greater promptness to think and feel without immediate external excitement, and a greater power in expressing such thoughts and feelings as are produced in him in that manner. But these passions and thoughts and feelings are the general passions and thoughts and feelings of men. And with what are they connected? Undoubtedly with our moral sentiments and animal sensations, and with the causes which excite these; with the operations of the elements, and the appearances of the visible universe; with storm and sunshine, with the revolutions of the seasons, with cold and heat, with loss of friends and kindred, with injuries and resentments, gratitude and hope, with fear and sorrow. These, and the like, are the sensations and objects which the poet describes, as they are the sensations of other men, and the objects which interest them. The poet thinks and feels in the spirit of human passions. How, then, can his language differ in any material degree from that of all other men who feel vividly and see clearly? It might be *proved* that it is impossible. But supposing that this were not the case, the poet might then be allowed to use a peculiar language when expressing his feelings for his own gratification, or that of men like himself. But poets do not write for poets alone, but for men. Unless, therefore, we are advocates for that admiration which subsists upon ignorance, and that pleasure which arises from hearing what we do not understand, the poet must descend from this supposed height; and, in order to excite rational sympathy, he must express himself as other men express themselves. To this it may be added that while he is only selecting from the real language of men, or, which amounts to the same thing, composing accurately in the spirit of such selection, he is treading upon safe ground, and we know what we are to expect from him. Our feelings are the same with respect to meter; for, as it may be proper to remind the reader, the distinction of meter is regular and uniform, and not, like that which is produced by what is usually called *poetic diction*, arbitrary, and subject to infinite caprices upon which no calculation whatever can be made. In the one case, the reader is utterly at the mercy of the poet, respecting what imagery or diction he may choose to connect with the passion; whereas in the other, the meter obeys certain laws, to which the poet and reader both willingly submit because they are certain, and because no interference is made by them with the passion, but such as the concurring testimony of ages has shown to heighten and improve the pleasure which coexists with it.

---

[12] In this long paragraph, the old classical contrast of poetry with history and philosophy is replaced by the modern contrast of poetry to science, which dominates criticism into the middle of the twentieth century. It expresses a new anxiety about poetry's cultural position.

It will now be proper to answer an obvious question, namely, why, professing these opinions, have I written in verse? To this, in addition to such answer as is included in what has been already said, I reply, in the first place, because, however I may have restricted myself, there is still left open to me what confessedly constitutes the most valuable object of all writing, whether in prose or verse—the great and universal passions of men, the most general and interesting of their occupations, and the entire world of nature before me—to supply endless combinations of forms and imagery. Now, supposing for a moment that whatever is interesting in these objects may be as vividly described in prose, why should I be condemned for attempting to superadd to such description the charm which, by the consent of all nations, is acknowledged to exist in metrical language? To this, by such as are yet unconvinced, it may be answered that a very small part of the pleasure given by poetry depends upon the meter, and that it is injudicious to write in meter, unless it be accompanied with the other artificial distinctions of style with which meter is usually accompanied, and that, by such deviation, more will be lost from the shock which will thereby be given to the reader's associations than will be counterbalanced by any pleasure which he can derive from the general power of numbers. In answer to those who still contend for the necessity of accompanying meter with certain appropriate colors of style in order to the accomplishment of its appropriate end, and who also, in my opinion, greatly underrate the power of meter in itself, it might, perhaps, as far as relates to these volumes, have been almost sufficient to observe that poems are extant, written upon more humble subjects, and in a still more naked and simple style, which have continued to give pleasure from generation to generation. Now if nakedness and simplicity be a defect, the fact here mentioned affords a strong presumption that poems somewhat less naked and simple are capable of affording pleasure at the present day; and what I wished *chiefly* to attempt, at present, was to justify myself for having written under the impression of this belief.

But various causes might be pointed out why, when the style is manly, and the subject of some importance, words metrically arranged will long continue to impart such a pleasure to mankind as he who proves the extent of that pleasure will be desirous to impart. The end of poetry is to produce excitement in coexistence with an overbalance of pleasure; but, by the supposition, excitement is an unusual and irregular state of the mind; ideas and feelings do not, in that state, succeed each other in accustomed order. If the words, however, by which this excitement is produced be in themselves powerful, or the images and feelings have an undue proportion of pain connected with them, there is some danger that the excitement may be carried beyond its proper bounds. Now the copresence of something regular, something to which the mind has been accustomed in various moods and in a less excited state, cannot but have great efficacy in tempering and restraining the passion by an intertexture of ordinary feeling, and of feeling not strictly and necessarily connected with the passion. This is unquestionably true; and hence, though the opinion will at first appear paradoxical, from the tendency of meter to divest language, in a certain degree, of its reality, and thus to throw a sort of half-consciousness of unsubstantial existence over the whole composition, there can be little doubt but that more pathetic situations and sentiments, that is, those which have a greater proportion of pain connected with them, may be endured in metrical composition, especially in rhyme, than in prose. The meter of the old ballads is very artless, yet they contain many passages which would illustrate this opinion; and, I hope, if the following poems be attentively perused, similar instances will be found in them. This opinion may be further illustrated by appealing to the reader's own experience of the reluctance with which he comes to the reperusal of the distressful parts of *Clarissa Harlowe,* or *The Gamester,*[13] while Shakespeare's writings, in the most pathetic scenes, never act upon us, as pathetic, beyond the bounds of pleasure—an effect which, in a much greater degree than might at first be imagined, is to be ascribed to small but continual and regular impulses of pleasurable surprise from the metrical arrangement.—On the other hand (what it must be allowed will much more frequently happen) if the poet's words should be incommensurate with the passion, and inadequate to raise the reader to a height of desirable excitement, then (unless the poet's choice of his meter has been grossly injudicious) in the feelings of pleasure which the reader has been accustomed to connect with meter in general, and in the feeling, whether cheerful or melancholy, which he has been accustomed to connect with that particular movement of meter, there will be found something which will greatly contribute to impart passion to the words, and to effect the complex end which the poet proposes to himself.

---

[13] *Clarissa Harlowe* by Samuel Richardson (1689–1761); *The Gamester* by Edward Moore (1712–1757).

If I had undertaken a *systematic* defense of the theory here maintained, it would have been my duty to develop the various causes upon which the pleasure received from metrical language depends. Among the chief of these causes is to be reckoned a principle which must be well known to those who have made any of the arts the object of accurate reflection; namely, the pleasure which the mind derives from the perception of similitude in dissimilitude. This principle is the great spring of the activity of our minds, and their chief feeder. From this principle the direction of the sexual appetite, and all the passions connected with it, take their origin: it is the life of our ordinary conversation; and upon the accuracy with which similitude are perceived, depend our taste and our moral feelings. It would not be a useless employment to apply this principle to the consideration of meter, and to show that meter is hence enabled to afford much pleasure, and to point out in what manner that pleasure is produced. But my limits will not permit me to enter upon this subject, and I must content myself with a general summary.

I have said that poetry is the spontaneous overflow of powerful feelings; it takes its origin from emotion recollected in tranquility: the emotion is contemplated till, by a species of reaction, the tranquility gradually disappears, and an emotion, kindred to that which was before the subject of contemplation, is gradually produced, and does itself actually exist in the mind. In this mood successful composition generally begins, and in a mood similar to this it is carried on; but the emotion, of whatever kind, and in whatever degree, from various causes, is qualified by various pleasures, so that in describing any passions whatsoever, which are voluntarily described, the mind will, upon the whole, be in a state of enjoyment. If nature be thus cautious to preserve in a state of enjoyment a being so employed, the poet ought to profit by the lesson held forth to him, and ought especially to take care that, whatever passions he communicates to his reader, those passions, if his reader's mind be sound and vigorous, should always be accompanied with an overbalance of pleasure. Now the music of harmonious metrical language, the sense of difficulty overcome, and the blind association of pleasure which has been previously received from works of rhyme or meter of the same or similar construction, an indistinct perception perpetually renewed of language closely resembling that of real life, and yet, in the circumstance of meter, differing from it so widely—all these imperceptibly make up a complex feeling of delight, which is of the most important use in tempering the painful feeling always found intermingled with powerful descriptions of the deeper passion. This effect is always produced in pathetic and impassioned poetry; while in lighter compositions the ease and gracefulness with which the poet manages his numbers are themselves confessedly a principal source of the gratification of the reader. All that it is *necessary* to say, however, upon this subject, may be effected by affirming, what few persons will deny, that of two descriptions, either of passions, manners, or characters each of them equally well executed, the one in prose and the other in verse, the verse will be read a hundred times where the prose is read once.

Having thus explained a few of my reasons for writing in verse, and why I have chosen subjects from common life, and endeavored to bring my language near to the real language of men, if I have been too minute in pleading my own cause, I have at the same time been treating a subject of general interest; and for this reason a few words shall be added with reference solely to these particular poems, and to some defects which will probably be found in them. I am sensible that my associations must have sometimes been particular instead of general, and that, consequently, giving to things a false importance, I may have sometimes written upon unworthy subjects; but I am less apprehensive on this account, than that my language may frequently have suffered from those arbitrary connections of feelings and ideas with particular words and phrases, from which no man can altogether protect himself. Hence I have no doubt that, in some instances, feelings, even of the ludicrous, may be given to my readers by expressions which appeared to me tender and pathetic. Such faulty expressions, were I convinced they were faulty at present, and that they must necessarily continue to be so, I would willingly take all reasonable pains to correct. But it is dangerous to make these alterations on the simple authority of a few individuals, or even of certain classes of men; for where the understanding of an author is not convinced, or his feelings altered, this cannot be done without great injury to himself: for his own feelings are his stay and support; and, if he set them aside in one instance, he may be induced to repeat this act till his mind shall lose all confidence in itself, and become utterly debilitated. To this it may be added that the critic ought never to forget that he is himself exposed to the same errors as the poet, and perhaps in a much greater degree: for there can be no presumption in saying of most readers that it is not probable they will be so well acquainted with the various stages of meaning through which words have passed, or with the fickleness or stability of the relations of particular ideas to each other; and, above all, since they are so much less interested in the subject, they may decide lightly and carelessly.

Long as the reader has been detained, I hope he will permit me to caution him against a mode of false criticism which has been applied to poetry, in which the language closely resembles that of life and nature. Such verses have been triumphed over in parodies, of which Dr. Johnson's stanza is a fair specimen:

I put my hat upon my head
And walked into the Strand,
And there I met another man
Whose hat was in his hand.

Immediately under these lines let us place one of the most justly admired stanzas of the *Babes in the Woods.*[14]

These pretty babes with hand in hand
Went wandering up and down;
But never more they saw the man
Approaching from the town.

In both those stanzas the words, and the order of the words in no respect differ from the most unimpassioned conversation. There are words in both, for example, *the Strand* and *the town,* connected with none but the most familiar ideas; yet the one stanza we admit as admirable, and the other as a fair example of the superlatively contemptible. Whence arises this difference? Not from the meter, not from the language, not from the order of the words; but the *matter* expressed in Dr. Johnson's stanza is contemptible. The proper method of treating trivial and simple verses to which Dr. Johnson's stanza would be a fair parallelism, is not to say, this is a bad kind of poetry, or, this is not poetry; but, this wants sense; it is neither interesting in itself, nor can *lead* to anything interesting; the images neither originate in that sane state of feeling which arises out of thought, nor can excite thought or feeling in the reader. This is the only sensible manner of dealing with such verses. Why trouble yourself about the species till you have previously decided upon the genus? Why take pains to prove that an ape is not a Newton, when it is self-evident that he is not a man?

One request I must make of my reader, which is, that in judging these poems he would decide by his own feelings genuinely, and not by reflection upon what will probably be the judgment of others. How common is it to hear a person say, I myself do not object to this style of composition, or this or that expression, but to such and such classes of people it will appear mean or ludicrous! This mode of criticism, so destructive of all sound unadulterated judgment, is almost universal: let the reader then abide, independently, by his own feelings, and, if he finds himself affected, let him not suffer such conjectures to interfere with his pleasure.

If an author, by any single composition, has impressed us with respect for his talents, it is useful to consider this as affording a presumption that on other occasions, where we have been displeased, he nevertheless may not have written ill or absurdly; and further, to give him so much credit for this one composition as may induce us to review what has displeased us with more care than we should otherwise have bestowed upon it. This is not only an act of justice, but, in our decisions upon poetry especially, may conduce in a high degree to the improvement of our own taste; for an *accurate* taste in poetry, and in all the other arts, as Sir Joshua Reynolds has observed, is an *acquired* talent, which can only be produced by thought and a long-continued intercourse with the best models of composition.[15] This is mentioned, not with so ridiculous a purpose as to prevent the most inexperienced reader from judging for himself (I have already said that I wish him to judge for himself), but merely to temper the rashness of decision, and to suggest that, if poetry be a subject on which much time has not been bestowed, the judgment may be erroneous; and that, in many cases, it necessarily will be so.

Nothing would, I know, have so effectually contributed to further the end which I have in view, as to have shown of what kind the pleasure is, and how that pleasure is produced, which is confessedly produced by metrical composition essentially different from that which I have here endeavored to recommend: for the reader will say that he has been pleased by such composition, and what more can be done for him? The power of any art is limited; and he will suspect that, if it be proposed to furnish him with new friends, that can be only upon condition of his abandoning his old friends. Besides, as I have said, the reader is himself conscious of the pleasure which he has received from such composition, composition to which he has peculiarly attached the endearing name of poetry; and all men feel an habitual gratitude, and something of an honorable bigotry, for the objects which have long continued to please them: we not only wish to be pleased, but to be pleased in that particular way in which we have been accustomed to be pleased. There is in these feelings enough to resist a host of arguments; and I should be the less able to combat them successfully, as I am willing to allow that, in order entirely to enjoy the poetry which I am recommending, it would be necessary to give up much of what is ordinarily enjoyed. But, would my limits have permitted me to point out how this pleasure is produced, many obstacles might have been removed, and the reader assisted in perceiving that the powers of language are not so limited as he may suppose; and that it is possible for poetry to give other enjoyments, of a purer, more lasting, and more exquisite nature. This part of the subject has not been altogether neglected, but it has not been so much my present aim to prove that the interest excited by some other kinds of poetry is less vivid, and less worthy of the nobler powers of the mind, as to offer reasons for presuming that, if my purpose were fulfilled, a species of poetry would be produced which is genuine poetry, in its nature well adapted to interest mankind permanently, and likewise important in the multiplicity and quality of its moral relations.

---

[14] An anonymous ballad.

[15] See *Discourse VII* (above, page 398ff.).

From what has been said, and from a perusal of the poems, the reader will be able clearly to perceive the object which I had in view: he will determine how far it has been attained; and, what is a much more important question, whether it will be worth attaining: and upon the decision of these two questions will test my claim to the approbation of the public.

Samuel Taylor Coleridge

1772–1834

For literary criticism in English the influence of Coleridge has been massive and multifaceted, but since the publication of *The Collected Works of Samuel Taylor Coleridge* (1969–) under the general editorship of Kathleen Coburn, one might risk saying that Coleridge's exemplary visibility in literary studies has obscured his remarkable influence in other areas. For his contemporaries and immediate descendants, including such figures as John Stuart Mill and diverse members of the "Apostle's Club" at Cambridge (from John Sterling to James Clerk Maxwell), Coleridge's influence was pervasive. As Sterling said in a letter to J. C. Hare, "To Coleridge I owe education. He taught me to believe that an empirical philosophy is none, that Faith is the highest Reason, that all criticism, whether of literature, laws, or manners, is blind, without the power of discerning the organic unity of the object."[1] As one of the great auto-didacts of all time, however, Coleridge presents many difficulties, as his ambitions to articulate a complete and comprehensive "dynamical philosophy" consistently failed to find a satisfactory publishable form. As a close but critical reader of Kant, Schelling, and Fichte (from all of whom he borrowed extensively), Coleridge was influential in introducing critical and transcendental philosophy to an English audience, as well as shaping early-nineteenth-century English thought on problems of science and method.

The selections here include Coleridge's indispensable work on Shakespeare and a portion of his essay "On the Principles of Genial Criticism," as well as his celebrated definitions of Primary and Secondary Imagination and Fancy, but greater emphasis is given to his speculative work from *Biographia Literaria, The Friend, The Statesman's Manual,* and *On the Constitution of Church and State.* In these works, we see Coleridge vigorously engaged in the effort to articulate a philosophical position in which creativity is not an anomaly but a fundamental principle. Though he borrowed (and stole) from virtually everything he read, from Plato to Ralph Cudworth, to Schelling and Fichte, his work is distinguished by subtle but significant deviations from the forms of idealism characteristic of his German contemporaries. Coleridge in his later years focused increasingly on two troublesome areas: the theological idea of the trinity, and the theoretical practice of natural science. In his remarkable "Essays on Method" from *The Friend* (1809) (reprinted in the 1818 *Encyclopedia Metropolitana* and later acknowledged by Charles Sanders Peirce for their influence upon "all Europe" and as an "improvement" upon Kant),[2] Coleridge develops his view of method as inherently dynamic and progressive, with illustrations of the essential importance of unifying ideas in scientific research (with striking similarities to Thomas Kuhn's later idea of the scientific "paradigm") that identify "central experiments" or "protophenomena" that in a certain sense first *create* scientific facts *as facts.*

---

[1] Quoted from *On the Constitution of Church and State,* lxii.

[2] Peirce, *Collected Papers,* A. W. Burks, ed., 1958.

Coleridge's Trinitarian speculations, though seemingly far removed in topic, share the same conviction that an *Idea* is not simply a representation of an object, but a "living power" that brings the possible into actuality, whether in philosophy, science, religion, politics, or poetry. As these selections suggest, Coleridge's consistent attestation concerning the systematic character of his thought has a good deal more credibility than has usually been granted. Learning how to read him is, accordingly, an ongoing critical project.

The new edition of Coleridge's works edited by Kathleen Coburn, begun in 1969, is nearing completion. It includes several volumes of Coleridge's notebooks and his marginalia to other authors. Some works, however, are still only available in W. G. T. Shedd's seven-volume edition of 1889 and other miscellaneous publications. For general questions and bibliographic information, see *The Cambridge Companion to Coleridge,* edited by Lucy Newlyn (2002), and *Samuel Taylor Coleridge: An Annotated Bibliography of Criticism and Scholarship,* edited by Richard and Josephine Haven and Maurianne Adams (1976–1996). Recent biographies include Rosemary Ashton, *The Life of Samuel Taylor Coleridge: A Critical Biography* (1996), and Richard Holmes's three biographical volumes: *Coleridge* (1982), *Coleridge: Early Visions* (1989), and *Coleridge: Darker Reflections* (1998). See also J. H. Muirhead, *Coleridge as Philosopher* (1930); René Wellek, *Immanuel Kant in England* (1939); Herbert Read, *Coleridge as Critic* (1948); Gordon McKenzie, *Organic Unity in Coleridge's Theory of Imagination* (1957); James R. Jackson, *Method and Imagination in Coleridge's Criticism* (1969); Thomas McFarland, *Coleridge and the Pantheist Tradition* (1969); Owen Barfield, *What Coleridge Thought* (1971); Kathleen Coburn, ed., *Inquiring Spirit: A New Presentation of Coleridge* (1979); Raimonda Modiano, *Coleridge and the Concept of Nature* (1985); James C. McKusick, *Coleridge's Philosophy of Language* (1986); Nigel Leask, *The Politics of Imagination in Coleridge's Thought* (1988); Deirdre Coleman, *Coleridge and The Friend (1809–1810)* (1988); Gerald McNiece, *The Knowledge That Endures: Coleridge, German Philosophy and the Logic of Romantic Thought* (1991); Tim Fulford, *Coleridge's Figurative Language* (1991); Mary Anne Perkins, *Coleridge's Philosophy: Logos as a Unifying Principle* (1994); Douglas Hedley, *Coleridge, Philosophy and Religion: Aids to Reflection and the Mirror of the Spirit* (2000); Nicholas Rowe, ed., *Samuel Taylor Coleridge and the Sciences of Life* (2001); Michael John Kooy, *Coleridge, Schiller, and Aesthetic Education* (2002); Tim Milnes, *Knowledge and Indifference in English Romantic Prose* (2003).

Shakespeare's Judgment Equal to His Genius

Thus, then, Shakespeare appears, from his *Venus and Adonis* and *Rape of Lucrece* alone, apart from all his great works, to have possessed all the conditions of the true poet.[1] Let me now proceed to destroy, as far as may be in my power, the popular notion that he was a great dramatist by mere instinct, that he grew immortal in his own despite, and sank below men of second- or third-rate power when he attempted aught beside the drama—even as bees construct

---

Coleridge's lecture "Shakespeare's Judgment Equal to His Genius" was first published in 1836 but was possibly delivered as early as 1808.

[1] Coleridge had discussed *Venus and Adonis* and *The Rape of Lucrece* in an earlier lecture, *Shakespeare as a Poet Generally.*

their cells and manufacture their honey to admirable perfection; but would in vain attempt to build a nest. Now this mode of reconciling a compelled sense of inferiority with a feeling of pride began in a few pedants, who, having read that Sophocles was the great model of tragedy, and Aristotle the infallible dictator of its rules, and finding that the *Lear, Hamlet, Othello,* and other masterpieces were neither in imitation of Sophocles nor in obedience to Aristotle—and, not having (with one or two exceptions) the courage to affirm, that the delight which their country received from generation to generation, in defiance of the alterations of circumstances and habits, was wholly groundless—took upon them, as a happy medium and refuge, to talk of Shakespeare as a sort of beautiful *lusus naturae,*[2] a delightful monster, wild, indeed, and without taste or judgment, but like the inspired idiots so much venerated in the East, uttering, amid the strangest follies, the sublimest truths. In nine places out of ten in which I find his awful name mentioned, it is with some epithet of "wild," "irregular," "pure child of nature," etc. If all this be true, we must submit to it; though to a thinking mind it cannot but be painful to find any excellence, merely human, thrown out of all human analogy, and thereby leaving us neither rules for intilation, nor motives to imitate; but, if false, it is a dangerous falsehood; for it affords a refuge to secret self-conceit, enables a vain man at once to escape his reader's indignation by general swollen panegyrics, and merely by his *ipse dixit*[3] to treat as contemptible what he has not intellect enough to comprehend, or soul to feel, without assigning any reason, or referring his opinion to any demonstrative principle; thus leaving Shakespeare as a sort of grand lama, adored indeed, and his very excrements prized as relics, but with no authority or real influence. I grieve that every late voluminous edition of his works would enable me to substantiate the present charge with a variety of facts, one-tenth of which would of themselves exhaust the time allotted to me. Every critic, who has or has not made a collection of black letter books—in itself a useful and respectable amusement—puts on the seven-league boots of self-opinion, and strides at once from an illustrator into a supreme judge, and blind and deaf, fills his three-ounce phial at the waters of Niagara; and determines positively the greatness of the cataract to be neither more nor less than his three-ounce phial has been able to receive.

I think this a very serious subject. It is my earnest desire—my passionate endeavor—to enforce at various times and by various arguments and instances the close and reciprocal connection of just taste with pure morality. Without that acquaintance with the heart of man, or that docility and childlike gladness to be made acquainted with it, which those only can have, who dare look at their own hearts—and that with a steadiness which religion only has the power of reconciling with sincere humility; without this, and the modesty produced by it. I am deeply convinced that no man, however wide his erudition, however patient his antiquarian researches, can possibly understand, or be worthy of understanding, the writings of Shakespeare.

Assuredly, that criticism of Shakespeare will alone be genial which is reverential. The Englishman, who without reverence, a proud and affectionate reverence, can utter the name of William Shakespeare, stands disqualified for the office of critic. He wants one at least of the very senses, the language of which he is to employ, and will discourse, at best, but as a blind man, while the whole harmonious creation of light and shade with all its subtle interchange of deepening and dissolving colors rises in silence to the silent fiat of the uprising Apollo. However inferior in ability I may be to some who have followed me, I own I am proud that I was the first in time who publicly demonstrated to the full extent of the position, that the supposed irregularity and extravagancies of Shakespeare were the mere dreams of a pedantry that arraigned the eagle because it had not the dimensions of the swan. In all the successive courses of lectures delivered by me, since my first attempt at the Royal Institution, it has been, and it still remains, my object, to prove that in all points from the most important to the most minute, the judgment of Shakespeare is commensurate with his genius, nay, that his genius reveals itself in his judgment, as in its most exalted form. And the more gladly do I recur to this subject from the clear conviction, that to judge aright, and with distinct consciousness of the grounds of our judgment, concerning the works of Shakespeare, implies the power and the means of judging rightly of all other works of intellect, those of abstract science alone excepted.

It is a painful truth that not only individuals, but even whole nations, are ofttimes so enslaved to the habits of their education and immediate circumstances, as not to judge disinterestedly even on those subjects, the very pleasure arising from which consists in its disinterestedness, namely, on subjects of taste and polite literature. Instead of deciding concerning their own modes and customs by any rule of reason, nothing appears rational, becoming, or beautiful to them, but what coincides with the peculiarities of their education. In this narrow circle, individuals may attain to exquisite discrimination, as the French critics have done in their own literature; but a true critic can no more be such without placing himself on some central point, from which he may command the whole, that is, some general rule, which, founded in reason, or the faculties common to all men, must therefore apply to each, than an astronomer can explain the movements of the solar system without taking his stand in the sun. And let me remark, that this will not tend to produce despotism, but, on the contrary, true tolerance, in the critic. He will, indeed, require, as the spirit and substance of a work, something true in human nature itself, and independent of all circumstances; but in the mode of applying it, he will estimate genius and judgment according to the felicity with which the imperishable soul of intellect shall have adapted itself to the age, the place, and the existing manners. The error he will expose lies in reversing this, and holding up the mere circumstances as perpetual, to the utter neglect of the power which can alone animate them. For art cannot exist without, or apart from, nature; and what has man of his own to give to his fellowman, but his own thoughts and feelings, and his observations so far as they are modified by his own thoughts or feelings?

---

[2] "Sport of nature."

[3] Literally, "He himself said it."

Let me, then, once more submit this question to minds emancipated alike from national, or party, or sectarian prejudice. Are the plays of Shakespeare works of rude uncultivated genius, in which the splendor of the parts compensates, if aught can compensate, for the barbarous shapelessness and irregularity of the whole? Or is the form equally admirable with the matter, and the judgment of the great poet not less deserving our wonder than his genius? Or, again, to repeat the question in other words: Is Shakespeare a great dramatic poet on account only of those beauties and excellencies which he possesses in common with the ancients, but with diminished claims to our love and honor to the full extent of his differences from them? Or are these very differences additional proofs of poetic wisdom, at once results and symbols of living power as contrasted with lifeless mechanism—of free and rival originality as contradistinguished from servile imitation, or, more accurately, a blind copying of effects, instead of a true imitation of the essential principles? Imagine not that I am about to oppose genius to rules. No! The comparative value of these rules is the very cause to be tried. The spirit of poetry, like all other living powers, must of necessity circumscribe itself by rules, were it only to unite power with beauty. It must embody in order to reveal itself; but a living body is of necessity an organized one; and what is organization but the connection of parts in and for a whole, so that each part is at once end and means? This is the discovery of criticism; it is a necessity of the human mind; and all nations have felt and obeyed it, in the invention of meter, and measured sounds, as the vehicle and *involucrum*[4] of poetry, itself a fellow-growth from the same life, even as the bark is to the tree!

No work of true genius dares want its appropriate form, neither indeed is there any danger of this. As it must not, so genius cannot, be lawless: for it is even this that constitutes it genius—the power of acting creatively under laws of its own origination. How then comes it that not only single *Zoili,*[5] but whole nations have combined in unhesitating condemnation of our great dramatist, as a sort of African nature, rich in beautiful monsters, as a wild heath where islands of fertility look the greener from the surrounding waste, where the loveliest plants now shine out among unsightly weeds, and now are choked by their parasitic growth, so intertwined that we cannot disentangle the weed without snapping the flower? In this statement I have had no reference to the vulgar abuse of Voltaire, save as far as his charges are coincident with the decisions of Shakespeare's own commentators and (so they would tell you) almost idolatrous admirers. The true ground of the mistake lies in the confounding mechanical regularity with organic form. The form is mechanic, when on any given material we impress a predetermined form, not necessarily arising out of the properties of the material; as when to a mass of wet clay we give whatever shape we wish it to retain when hardened. The organic form, on the other hand, is innate; it shapes, as it develops, itself from within, and the fullness of its development is one and the same with the perfection of its outward form. Such as the life is, such is the form. Nature, the prime genial artist, inexhaustible in diverse powers, is equally inexhaustible in forms, each exterior is the physiognomy of the being within its true image reflected and thrown out from the concave mirror: and even such is the appropriate excellence of her chosen poet, of our own Shakespeare, himself a nature humanized, a genial understanding, directing self-consciously a power and an implicit wisdom deeper even than our consciousness.

I greatly dislike beauties and selections in general; but as proof postive of his unrivaled excellence, I should like to try Shakespeare by this criterion. Make out your amplest catalogue of all the human faculties, as reason or the moral law, the will, the feeling of the coincidence of the two (a feeling *sui generis et demonstratio demonstrationun*[6]) called the conscience, the understanding, or prudence, wit, fancy, imagination, judgment, and then of the objects on which these are to be employed, as the beauties, the terrors, and the seeming caprices of nature, the capabilities, that is, the actual and the ideal, of the human mind, conceived as an individual or as a social being, as in innocence or in guilt, in a play-paradise or in a war field of temptation; and then compare with Shakespeare under each of these heads all or any of the writers in prose and verse that have ever lived! Who, that is competent to judge, doubts the result? And ask your own hearts, ask your own commonsense to conceive the possibility of this man being—I say not, the drunken savage of that wretched sciolist,[7] whom Frenchmen, to their shame, have honored before their elder and better worthies—but the anomalous, the wild, the irregular, genius of our daily criticism! What! Are we to have miracles in sport?—Or, I speak reverently, does God choose idiots by whom to convey divine truths to man?

[4] Wrapper or envelope; clothing.

[5] Zolius was a critic of Homer.

[6] "Of its own kind (unique) and self-demonstrative."

On the Principles of Genial Criticism

from Essay Third

I proceed to my promised and more amusing task, that of establishing, illustrating, and exemplifying the distinct powers of the different modes of pleasure excited by the works of nature or of human genius with their exponent and appropriable terms. . . .

Agreeable

We use this word in two senses; in the first for whatever agrees with our nature, for that which is congruous with the primary constitution of our senses. Thus green is naturally agreeable to the eye. In this sense the word expresses, at least involves, a preestablished harmony between the organs and their appointed objects. In the second sense, we convey by the word *agreeable,* that the thing has by force of habit (thence called a second nature) been made to agree with us; or that it has become agreeable to us by its recalling to our minds some one or more things that were dear and pleasing to us; or lastly, on account of some after pleasure or advantage, of which it has been the constant cause or occasion. Thus by force of custom men *make* the taste of tobacco,[1] which was at first hateful to the palate, agreeable to them; thus too, as our Shakespeare observes, "Things base and vile, holding no quality, / Love can transpose to form and dignity—"[2] the crutch that had supported a revered parent, after the first anguish of regret, becomes agreeable to the affectionate child; and I once knew a very sensible and accomplished Dutch gentleman, who, spite of his own sense of the ludicrous nature of the feeling, was more delighted by the first grand concert of frogs he heard in this country, than he had been by Catalina singing in the compositions of Cimarosa.[3] The last clause needs no illustrations, as it comprises all the objects that are agreeable to us, only because they are the means by which we gratify our smell, touch, palate, and mere bodily feeling.

Beautiful

The beautiful, contemplated in its essentials, that is, in *kind* and not in *degree,* is that in which the *many,* still seen as many, becomes one. Take a familiar instance, one of a thousand. The frost on a windowpane has by accident crystallized into a striking resemblance of a tree or a seaweed. With what pleasure we trace the parts, and their relations to each other, and to the whole! Here is the stalk or trunk, and here the branches or sprays—sometimes even the buds or flowers. Nor will our pleasure be less, should the caprice of the crystallization represent some object disagreeable to us, provided only we can see or fancy the component parts each in relation to each, and all forming a whole. A lady would see an admirably painted tiger with pleasure, and at once pronounce it beautiful—nay, an owl, a frog, or a toad, who would have shrieked or shuddered at the sight of the things themselves. So far is the beautiful from depending wholly on association, that it is frequently produced by the mere removal of associations.[4] Many a sincere convert to the beauty of various insects, as of the dragonfly, the fangless snake, *&c.,* has natural history made, by exploding the terror or aversion that had been connected with them.

The most general definition of beauty, therefore, is—that I may fulfill my threat of plaguing my readers with hard words—multeity in unity. Now it will be always found, that whatever is the definition of the *kind,* independent of degree, becomes likewise the definition of the highest degree of that kind. An old coach wheel lies in the coachmaker's yard, disfigured with tar and dirt (I purposely take the most trivial instances)—if I turn away my attention from these, and regard the *figure* abstractly, "still," I might say to my companion, "there is beauty in that wheel, and you yourself would not only admit, but would feel it, had you never seen a wheel before. See how the rays proceed from the center to the circumferences, and how many different images are distinctly comprehended at one glance, as forming one whole, and each part in some harmonious relation to each and to all." But imagine the polished golden wheel of the chariot of the sun, as the poets have described it: then the figure, and the real thing so figured, exactly coincide. There is nothing heterogeneous, nothing to abstract from: by its perfect smoothness and circularity in width, each part is (if I may borrow a metaphor from a sister sense) as perfect a melody, as the whole is a complete harmony. This, we should say, is beautiful throughout. Of all "the many," which I actually see, each and all are really reconciled into unity: while the effulgence from the whole coincides with, and seems to represent, the effluence of delight from my own mind in the intuition of it.

---

[7] From *sciolus,* "smatterer."

On the Principles of Genial Criticism Concerning the Fine Arts was first published in 1814 in a Bristol periodical.

[1] Burke (above, page 334).

[2] *Midsummer Night's Dream, I.i.* 232–3. Coleridge, however, substitutes *quality* for *quantity.*

[3] Domenico Cimarosa (1749–1801), Italian composer, a favorite of Coleridge's.

[4] Here Coleridge nearly suggests what would later becalled psychical distance.

It seems evident then, first, that beauty is harmony, and subsists only in composition, and secondly, that the first species of the agreeable can alone be a component part of the beautiful, that namely which is naturally consonant with our senses by the preestablished harmony between nature and the human mind; and thirdly, that even of this species, those objects only can be admitted (according to rule the first) which belong to the eye and ear, because they alone are susceptible of distinction of parts. Should an Englishman gazing on a mass of cloud rich with the rays of the rising sun exclaim, even without distinction of, or reference to its form, or its relation to other objects, "How beautiful!" I should have no quarrel with him. First, because by the law of association there is in all visual beholdings at least an indistinct subsumption of form and relation; and, secondly, because even in the coincidence between the sight and the object there is an approximation to the reduction of the many into one. But who, that heard a Frenchman call the flavor of a leg of mutton a beautiful taste would not immediately recognize him for a Frenchman, even though there should be neither grimace or characteristic nasal twang? The result, then, of the whole is that the shapely (i.e. *formosus*) joined with the naturally agreeable, constitutes what, speaking accurately, we mean by the word *beautiful* (i.e. *pulcher*).

But we are conscious of faculties far superior to the highest impressions of sense; we have life and free will.—What then will be the result, when the beautiful, arising from regular form, is so modified by the perception of life and spontaneous action, as that the latter only shall be the object of our conscious *perception*, while the former merely acts, and yet does effectively act, on our feelings? With pride and pleasure I reply by referring my reader to the group in Mr. Allston's[5] grand picture of the *Dead Man Reviving from the Touch of the Bones of the Prophet Elisha,* beginning with the slave at the head of the reviving body, then proceeding to the daughter clasping her swooning mother; to the mother, the wife of the reviving man; then to the soldier behind who supports her; to the two figures eagerly conversing: and lastly, to the exquisitely graceful girl who is bending downward, and whose hand nearly touches the thumb of the slave! You will find, what you had not suspected, that you have here before you a circular group. But by what variety of life, motion, and passion is all the stiffness, that would result from an obvious regular figure swallowed up, and the figure of the group as much concealed by the action and passion, as the skeleton, which gives the form of the human body, is hidden by the flesh and its endless outlines!

In Raphael's admirable *Galatea*[6] (the print of which is doubtless familiar to most of my readers) the circle is perceived at first sight; but with what multiplicity of rays and chords within the area of the circular group, with what elevations and depressions of the circumference, with what an endless variety and sportive wildness in the component figure, and in the junctions of the figures, is the balance, the perfect reconciliation, effected between these two conflicting principles of the free life, and of the confining form! How entirely is the stiffness that would have resulted from the obvious regularity of the latter, *fused* and (if I may hazard so bold a metaphor) almost *volatilized* by the interpenetration and electrical flashes of the former.

But I shall recur to this consummate work for more specific illustrations hereafter: and have indeed in some measure offended already against the laws of method, by anticipating materials which rather belong to a more advanced stage of the disquisition. It is time to recapitulate, as briefly as possible, the arguments already advanced, and having summed up the result, to leave behind me this, the only portion of these essays, which, as far as the subject itself is concerned, will demand any *effort* of attention from a reflecting and intelligent reader. And let me be permitted to remind him, that the distinctions, which it is my object to prove and elucidate, have not merely a foundation in nature and the noblest faculties of the human mind, but are likewise the very groundwork, nay, an indispensable condition, of all *rational* inquiry concerning the arts. For it is self-evident, that whatever may be judged of differently by different persons, in the very same degree of moral and intellectual cultivation, extolled by one and condemned by another, without any error being assignable to either, can never be an object of general principles: and vice versa, that whatever can be brought to the test of general principles presupposes a distinct origin from these pleasures and tastes, which, for the wisest purposes, are made to depend on local and transitory fashions, accidental associations, and the peculiarities of individual temperament: to all which the philosopher, equally with the well-bred man of the world, applies the old adage, *de gustibus non est disputandum.*[7] Be it, however, observed that *de gustibus* is by no means the same as *de gustu,* nor will it escape the scholar's recollection, that taste, in its metaphorical use, was first adopted by the Romans, and unknown to the less luxurious Greeks, who designed this faculty, sometimes by the word αἴαθηοις and sometimes by φιλοκαλία[8]—ἀνδρῶν τῶν καο' ἡμᾶς φιλοκαλώτατος γεγονώς—i.e. "endowed by nature with the most exquisite taste of any man of our age," says Porphyry of his friend, Castricius. Still, this metaphor, borrowed from the pregustatores of the old Roman banquets, is singularly happy and appropriate. In the palate, the perception of the object and its qualities is involved in the *sensation,* in the mental taste it is involved in the *sense.* We have a *sensation* of sweetness, in a healthy palate, from honey; a *sense* of beauty, in an uncorrupted taste, from the view of the rising or setting sun.

---

[5] Washington Allston (1779–1843), American painter and a friend of Coleridge's. The three essays in *On the Principles of Genial Criticism* were written in order to draw attention to an exhibition of Allston's works.

[6] Galatea was the name of the statue created by Pygmalion, brought to life by Venus in answer to Pygmalion's prayer. Raphael's fresco is in the Villa Farnesina in Rome.

Recapitulation

Principle the First

That which has become, or which has been *made* agreeable to us, from causes not contained in its own nature, or in its original conformity to the human organs and faculties; that which is not pleasing for its own sake, but by connection or association with some other thing, separate or separable from it, is neither beautiful, nor capable of being a component part of beauty: though it may greatly increase the sum of our pleasure, when it does not interfere with the beauty of the object, nay, even when it detracts from it. A moss rose, with a sprig of myrtle and jasmine, is not more *beautiful* from having been plucked from the garden, or presented to us by the hand of the woman we love, but is abundantly more delightful. The total pleasure received from one of Mr. Bird's finest pictures may, without any impeachment of our taste, be the greater from his having introduced into it the portrait of one of our friends, or from our pride in him as our townsman, or from our knowledge of his personal qualities; but the amiable artist would rightly consider it a coarse compliment, were it affirmed, that the *beauty* of the piece, or its merit as a work of genius, was the more perfect on this account. I am conscious that I look with a stronger and more pleasurable emotion at Mr. Allston's large landscape, in the spirit of Swiss scenery, from its having been the occasion of my first acquaintance with him in Rome. This may or may not be a compliment to *him;* but the true compliment to the picture was made by a lady of high rank and cultivated taste, who declared, in my hearing, that she never stood before that landscape without seeming to feel the breeze blow out of it upon her. But the most striking instance is afforded by the portrait of a departed or absent friend or parent; which is endeared to us, and more delightful, from some awkward position of the limbs, which had defied the contrivances of art to render it picturesque, but which was the characteristic habit of the original.

Principle the Second

That which is naturally agreeable and consonant to human nature, so that the exceptions may be attributed to disease or defect; that, the pleasure from which is contained in the immediate impression; cannot, indeed, with strict propriety, be called beautiful, exclusive of its relations, but one among the component parts of beauty, in whatever instance it is susceptible of existing as a part of whole. This, of course, excludes the mere objects of the taste, smell, and feeling, though the sensation from these, especially from the latter when organized into touch, may secretly, and without our consciousness, enrich and vivify the perceptions and images of the eye and ear; which alone are true organs of sense, their sensations in a healthy or uninjured state being too faint to be noticed by the mind. We may, indeed, in common conversation, call purple a beautiful color, or the tone of a single note on an excellent pianoforte a beautiful tone; but if we were questioned, we should agree that a rich or delightful color, a rich, or sweet, or clear tone; would have been more appropriate—and this with less hesitation in the latter instance than in the former, because the single tone is more manifestly of the nature of a *sensation,* while color is the medium which seems to blend sensation and perception, so as to hide, as it were, the former in the latter; the direct opposite of which takes place in the lower senses of feeling, smell, and taste. (In strictness, there is even in these an ascending scale. The smell is less sensual and more sentient than mere feeling, the taste than the smell, and the eye than the ear: but between the ear and the taste exists the chasm or break, which divides the beautiful and the elements of beauty from the merely agreeable.) When I reflect on the manner in which smoothness, richness of sound, &c., enter into the formation of the beautiful, I am induced to suspect that they act negatively rather than positively. Something there must be to realize the form, something in and by which the *forma informans*[9] reveals itself: and these, less than any that could be substituted, and in the least possible degree, distract the attention, in the least possible degree obscure the idea, of which they (composed into outline and surface) are the symbol. An illustrative hint may be taken from a pure crystal, as compared with an opaque, semi-opaque or clouded mass, on the one hand, and with a perfectly transparent body, such as the air, on the other. The crystal is lost in the light, which yet it contains, embodies, and gives a shape to; but which passes shapeless through the air, and, in the ruder body, is either quenched or dissipated.

---

[7] "There is no disputing tastes."

[8] That is, *"aesthesis,"* perception by the senses; and *"philokalia,"* love of the beautiful. The philosopher Porphyry (ca. 234–305 A.D.) is best known as the biographer of Plotinus.

Principle the Third

The safest definition, then, of beauty, as well as the oldest, is that of Pythagoras: the reduction of many to one—or, as finely expressed by the sublime disciple of Ammonius,[10] τὸ ἄμερες ὄν, ἐν πολλοῖξ φανταζόμενον,[11] of which the following may be offered as both paraphrase and corollary. *The sense of beauty subsists in simultaneous intuition of the relation of parts, each to each, and of all to a whole: exciting an immediate and absolute complacency, without intervenence, therefore, of any interest, sensual or intellectual.* The beautiful is thus at once distinguished both from the aggreable, which is beneath it, and from the good, which is above it: for both these have an interest necessarily attached to them: both act on the will, and excite a desire for the actual existence of the image or idea contemplated: while the sense of beauty rests gratified in the mere contemplation or intuition, regardless whether it be a fictitious Apollo, or a real Antinous.[12]

The Mystics meant the same, when they define beauty as the subjection of matter to spirit so as to be transformed into a symbol, in and through which the spirit reveals itself; and declare *that* the *most* beautiful, where the most obstacles to a full manifestation have been most perfectly overcome.

* * *

Scholium

We have sufficiently distinguished the beautiful from the agreeable, by the sure criterion, that, when we find an object agreeable, the *sensation* of pleasure always precedes the judgment, and is its determining cause. We *find* it agreeable. But when we declare an object beautiful, the contemplation or intuition of its beauty precedes the *feeling* of complacency, in order of nature at least: nay, in great depression of spirits may even exist without sensibly producing it.

> A grief without a pang, void, dark, and drear!
> A stifled, drowsy, unimpassioned grief,
> That finds no natural outlet, no relief
> In word, or sigh, or tear!
> O dearest lady! in this heartless mood,
> To other thoughts by yon sweet throstle wooed!
> All this long eve, so balmy and serene,
> Have I been gazing at the western sky.[13]

Now the least reflection convinces us that our sensations, whether of pleasure or of pain, are the incommunicable parts of our nature; such as can be reduced to no universal rule; and in which therefore we have no right to expect that others should agree with us, or to blame them for disagreement. That the Greenlander prefers train oil to olive oil, and even to wine, we explain at once by our knowledge of the climate and productions to which he has been habituated. Were the man as enlightened as Plato, his palate would still find that most agreeable to which it had been most accustomed. But when the Iroquois sachem, after having been led to the most perfect specimens of architecture in Paris, said that he saw nothing so beautiful as the cook's shops,[14] we attribute this without hesitation to savagery of intellect, and infer with certainty that the sense of the beautiful was either altogether dormant in his mind, or at best very imperfect. The beautiful, therefore, not originating in the sensations, must belong to the intellect: and therefore we *declare* an object beautiful, and feel an inward right to *expect* that others should coincide with us. But we feel no right to *demand* it: and this leads us to that, which hitherto we have barely touched upon, and which we shall now attempt to illustrate more fully, namely, to the distinction of the beautiful from the good.

---

[9] "Shaping form."

[10] The "disciple" in question is Plotinus; Ammonius (also the teacher of Origen) was an Alexandrian philosopher who left no written works.

[11] "The one [which] makes itself manifest in the many." Coleridge expands the idea into an illustration of his principle of organic form.

[12] Antinous was the favorite and lover of the emperor Hadrian, who erected temples and monuments (even a city, Antinoopolis) to him in many places throughout the Roman empire.

[13] From stanza 2 of Coleridge's *Dejection: An Ode.*

[14] Kant used the same example in his *Critique of Judgment,* page 420.

Let us suppose Milton in company with some stern and prejudiced Puritan, contemplating the front of York Cathedral, and at length expressing his admiration of its beauty. We will suppose it too at that time of his life, when his religious opinions, feelings, and prejudices most nearly coincided with those of the rigid antiprelatists. P.: Beauty; I am sure, it is not the beauty of holiness. M.: True; but yet it is beautiful. P.: It delights not me. What is it good for? Is it of any use but to be stared at? M.: Perhaps not! But still it is beautiful. P.: But call to mind the pride and wanton vanity of those cruel shavelings, that wasted the labor and substance of so many thousand poor creatures in the erection of this haughty pile. M.: I do. But still it is very beautiful. P.: Think how many score of places of worship, incomparably better suited both for prayer and preaching, and how many faithful ministers might have been maintained, to the blessing of tens of thousands, to them and their children's children, with the treasures lavished on this worthless mass of stone and cement. M.: Too true! But nevertheless it is *very* beautiful. P.: And it is not merely useless; but it feeds the pride of the prelates, and keeps alive the popish and carnal spirit among the people. M.: Even so! And I presume not to question the wisdom, nor detract from the pious zeal, of the first reformers of Scotland, who for these reasons destroyed so many fabrics, scarce inferior in beauty to this now before our eyes. But I did not call it *good*, nor have I told thee, brother! that if this were leveled with the ground, and existed only in the works of the modeler or engraver, that I should desire to reconstruct it. The good consists in the congruity of a thing with the laws of the reason and the nature of the will, and in its fitness to determine the latter to actualize the former: and it is always discursive. The beautiful arises from the perceived harmony of an object, whether sight or sound, with the inborn and constitutive rules of the judgment and imagination: and it is always intuitive. As light to the eye, even such is beauty to the mind, which cannot but have complacency in whatever is perceived as preconfigured to its living faculties. Hence the Greeks called a beautiful object καλόν quasi καλοῦν, i.e. *calling on* the soul, which receives instantly, and welcomes it as something connatural.

Biographia Literaria

from

Chapter 12

A Chapter of requests and premonitions concerning the perusal or omission of the chapter that follows

In the perusal of philosophical works I have been greatly benefited by a resolve, which, in the antithetic form and with the allowed quaintness of an adage or maxim, I have been accustomed to word thus: *"until you understand a writer's ignorance, presume yourself ignorant of his understanding."*[1] This *golden rule* of mine does, I own, resemble those of Pythagoras in its obscurity rather than in its depth. If however the reader will permit me to be my own Hierocles,[2] I trust, that he will find its meaning fully explained by the following instances. I have now before me a treatise of a religious fanatic, full of dreams and supernatural *experiences.*[3] I see clearly the writer's grounds, and their hollowness. I have a complete insight into the causes, which through the medium of his body had acted on his mind; and by application of received and ascertained laws I can satisfactorily explain to my own reason all the strange incidents, which the writer records of himself. And this I can do without suspecting him of any intentional falsehood. As when in broad day-light a man tracks the steps of a traveller, who had lost his way in a fog or by treacherous moonshine, even so, and with the same tranquil sense of certainty, can I follow the traces of this bewildered visionary. I UNDERSTAND HIS IGNORANCE.

On the other hand, I have been re-perusing with the best energies of my mind the Timæus of PLATO. Whatever I comprehend, impresses me with a reverential sense of the author's genius; but there is a considerable portion of the work, to which I can attach no consistent meaning. In other treatises of the same philosopher intended for the average comprehensions of men, I have been delighted with the masterly good sense, with the perspicuity of the language, and the aptness of the inductions. I recollect likewise, that

Biographia Literaria was written in 1815 but published in 1817. Excerpts reprinted from James Engell and W. Jackson Bate, eds., *Biographia Literaria* (1983).

[1] Coleridge first expressed this maxim in 1801, in *Collected Notebooks I*, 928 f. 27.

[2] Alexandrian philosophical commentator, fl. 430 A.D.

[3] Coleridge may be referring here to Immanuel Swedenborg, who characteristically reports his visions as "Memorable Experiences." For details, see Engell and Bate, eds., *Biographia Literaria*, 232.

numerous passages in this author, which I thoroughly comprehend, were formerly no less unintelligible to me, than the passages now in question. It would, I am aware, be quite *fashionable* to dismiss them at once as Platonic Jargon. But this I cannot do with satisfaction to my own mind, because I have sought in vain for causes adequate to the solution of the assumed inconsistency. I have no insight into the possibility of a man so eminently wise, using words with such half-meanings to himself, as must perforce pass into no-meaning to his readers. When in addition to the motives thus suggested by my own reason, I bring into distinct remembrance the number and the series of great men, who after long and zealous study of these works had joined in honoring the name of PLATO with epithets, that almost transcend humanity, I feel, that a contemptuous verdict on my part might argue want of modesty, but would hardly be received by the judicious, as evidence of superior penetration. Therefore, utterly baffled in all my attempts to understand the ignorance of Plato, I CONCLUDE MYSELF IGNORANT OF HIS UNDERSTANDING.

In lieu of the various requests which the anxiety of authorship addresses to the unknown reader, I advance but this one; that he will either pass over the following chapter altogether, or read the whole connectedly.[4]

* * *

The postulate of philosophy and at the same time the test of philosophic capacity, is no other than the heaven-descended KNOW THYSELF! (*E cœlo descendit,* Γνῶθι σεαυτόν).[5] And this at once practically and speculatively. For as philosophy is neither a science of the reason or understanding only, nor merely a science of morals, but the science of BEING altogether, its primary ground can be neither merely speculative or merely practical, but both in one. All knowledge rests on the coincidence of an object with a subject.[6] (My readers have been warned in a former chapter that for their convenience as well as the writer's, the term, subject, is used by me in its scholastic sense as equivalent to mind or sentient being, and as the necessary correlative of object or *quicquid objicitur menti.*[7]) For we can *know* that only which is true: and the truth is universally placed in the coincidence of the thought with the thing, of the representation with the object represented.

Now the sum of all that is merely OBJECTIVE, we will henceforth call NATURE, confining the term to its passive and material sense, as comprising all the phænomena by which its existence is made known to us. On the other hand the sum of all that is SUBJECTIVE, we may comprehend in the name of the SELF OR INTELLIGENCE. Both conceptions are in necessary antithesis. Intelligence is conceived of as exclusively representative, nature as exclusively represented; the one as conscious, the other as without consciousness. Now in all acts of positive knowledge there is required a reciprocal concurrence of both, namely of the conscious being, and of that which is in itself unconscious. Our problem is to explain this concurrence, its possibility and its necessity.

During the act of knowledge itself, the objective and subjective are so instantly united, that we cannot determine to which of the two the priority belongs. There is here no first, and no second; both are coinstantaneous and one. While I am attempting to explain this intimate coalition, I must suppose it dissolved. I must necessarily set out from the one, to which therefore I give hypothetical antecedence, in order to arrive at the other. But as there are but two factors or elements in the problem, subject and object, and as it is left indeterminate from which of them I should commence, there are two cases equally possible.

1. EITHER THE OBJECTIVE IS TAKEN AS THE FIRST, AND THEN WE HAVE TO ACCOUNT FOR THE SUPERVENTION OF THE SUBJECTIVE, WHICH COALESCES WITH IT.

The notion of the subjective is not contained in the notion of the objective. On the contrary they mutually exclude each other. The subjective therefore must supervene to the objective. The conception of nature does not apparently involve the co-presence of an intelligence making an ideal duplicate of it, i.e. representing it. This desk for instance would (according to our natural notions) be, though there should exist no sentient being to look at it. This then is the problem of natural philosophy. It assumes the objective or unconscious nature as the first, and has therefore to explain how intelligence can supervene to it, or how itself can grow into intelligence. If it should appear, that all enlightened naturalists without having distinctly proposed the problem to themselves have yet constantly moved in the line of its solution, it must afford a strong presumption that the problem itself is founded in nature. For if all knowledge has as it were two poles reciprocally required and presupposed, all sciences must proceed from the one or the other, and must tend toward the opposite as far as the equatorial point in which both are reconciled and become identical. The necessary tendence therefore of all natural philosophy is from nature to intelligence; and this, and no other, is the true ground and occasion of the instinctive striving to introduce theory into our views of natural phænomena. The highest perfection of natural philosophy would consist in the perfect spiritualization of all the laws of nature into laws of intuition and intellect. The phænomena *(the material)* must wholly disappear, and the laws alone *(the formal)* must remain. Thence it comes, that in nature itself the more the principle of law breaks forth, the more does the *husk* drop off, the phænomena themselves become more spiritual and at length cease altogether in our consciousness. The optical phænomena are but a geometry, the lines of which are drawn by light, and the materiality of this light itself has already become matter of doubt. In the appearances of magnetism all trace of matter is lost, and of the phænomena of gravitation, which not a few among the most illustrious Newtonians have declared no otherwise comprehensible than as an immediate spiritual influence, there remains nothing but its law, the execution of which on a vast scale is the mechanism of the heavenly motions. The theory of natural philosophy would then be completed, when all nature was demonstrated to be identical in essence with that, which in its highest known power exists in man as intelligence and self-consciousness; when the heavens and the earth shall declare not only the power of their maker, but the glory and the presence of their God, even as he appeared to the great prophet during the vision of the mount in the skirts of his divinity.[8]

---

[4] We acknowledge the acute irony of breaking this excerpt exactly here, particularly since what follows is a long controversial philosophical discussion, deeply indebted to Schelling's *System of Transcendental Idealism* but drawing also on Kant and Fichte. In Coleridge's many attempts to clarify both his concurrence and his divergence from his contemporaries, this discussion provides a useful outline, though as Coleridge himself recognized, it was not the definitive statement to which he aspired. Particularly in Chapter 13, Coleridge recognized that the pathway upon which he embarked here (largely Schelling's) did *not* lead to his own desired destination, a philosophical account of the imagination. Accordingly, he interrupts his argument by the device of a letter (not included here) that vividly expresses his own dissatisfaction with this line of argument as leading to "the cave of Trophonius" (the architect of the temple to Apollo) where, according to legend, people seeking prophetic enlightenment were dragged down into the depths and subjected to confusing noises and sights before receiving it. See in this connection Coleridge's fuller development of these issues in "Essays on the Principles of Method" from *The Friend,* as well as appendices to *The Statesman's Manual* and *On the Constitution of Church and State* (below, page 508 and page 519).

[5] Adapted from Juvenal 11.27: "It descended from heaven, *Know thyself.*" This motto was inscribed over the temple of the oracle at Delphi.

[6] Coleridge's main source for the following discussion is Schelling's *System of Transcendental Idealism,* sections 1–8, with occasional sentences from other works and numerous alterations, additions, and clarifications. We refer the reader to the extensive notes and citations in Engell and Bate, eds., *Biographia Literaria.*

[7] "Whatever is thrown before (presented to) the mind."

This may suffice to show, that even natural science, which commences with the material phænomenon as the reality and substance of things existing, does yet by the necessity of theorising unconsciously, and as it were instinctively, end in nature as an intelligence; and by this tendency the science of nature becomes finally natural philosophy, the one of the two poles of fundamental science.

2. OR THE SUBJECTIVE IS TAKEN AS THE FIRST, AND THE PROBLEM THEN IS, HOW THERE SUPERVENES TO IT A COINCIDENT OBJECTIVE.

In the pursuit of these sciences, our success in each, depends on an austere and faithful adherence to its own principles with a careful separation and exclusion of those, which appertain to the opposite science. As the natural philosopher, who directs his views to the objective, avoids above all things the intermixture of the subjective in his knowledge, as for instance, arbitrary suppositions or rather suffictions, occult qualities, spiritual agents, and the substitution of final for efficient causes; so on the other hand, the transcendental or intelligential philosopher is equally anxious to preclude all interpolation of the objective into the subjective principles of his science, as for instance the assumption of impresses or configurations in the brain, correspondent to miniature pictures on the retina painted by rays of light from supposed originals, which are not the immediate and real objects of vision, but deductions from it for the purposes of explanation. This purification of the mind is effected by an absolute and scientific scepticism to which the mind voluntarily determines itself for the specific purpose of future certainty. Des Cartes who (in his meditations) himself first, at least of the moderns, gave a beautiful example of this voluntary doubt, this self-determined indetermination, happily expresses its utter difference from the scepticism of vanity or irreligion: Nec tamen in eo scepticos imitabar, qui dubitant tantum ut dubitent, et preter incertitudinem ipsam nihil quærunt. Nam contra totus in eo eram ut aliquid certi reperirem. DES CARTES, *de Methodo*.[9] Nor is it less distinct in its motives and final aim, than in its proper objects, which are not as in ordinary scepticism the prejudices of education and circumstance, but those original and innate prejudices which nature herself has planted in all men, and which to all but the philosopher are the first principles of knowledge, and the final test of truth.

Now these essential prejudices are all reducible to the one fundamental presumption, THAT THERE EXIST THINGS

---

[8] Cf. Ps. 19.1; Exod. 24.12–18. In this paragraph and the next, Coleridge is very close to *Naturphilosophie* following Fichte, Schelling, and Steffans; cf. Modiano, *Coleridge and the Concept of Nature*. But see his considerably more sophisticated position on this issue in the "Essays on the Principles of Method" (below, page 508).

[9] Descartes, *Discourse on Method*, iii, 29: "In this I did not wish to imitate the skeptics, who doubted only for the sake of doubting and intended to remain always irresolute; on the contrary, my whole purpose was to achieve greater certainty. . . ."

WITHOUT US. As this on the one hand originates, neither in grounds or arguments, and yet on the other hand remains proof against all attempts to remove it by grounds or arguments *(naturam furca expellas tamen usque redibit)*[10] on the one hand lays claim to IMMEDIATE certainty as a position at once indemonstrable and irresistible, and yet on the other hand, inasmuch as it refers to something essentially different from ourselves, nay even in opposition to ourselves, leaves it inconceivable how it could possibly become a part of our immediate consciousness; (in other words how that, which ex hypothesi is and continues to be extrinsic and alien to our being, should become a modification of our being) the philosopher therefore compels himself to treat this faith as nothing more than a prejudice, innate indeed and connatural, but still a prejudice.

The other position, which not only claims but necessitates the admission of its immediate certainty, equally for the scientific reason of the philosopher as for the common sense of mankind at large, namely, I AM, cannot so properly be intitled a prejudice. It is groundless indeed; but then in the very idea it precludes all ground, and separated from the immediate consciousness loses its whole sense and import. It is groundless; but only because it is itself the ground of all other certainty. Now the apparent contradiction, that the former position, namely, the existence of things without us, which from its nature cannot be immediately certain should be received as blindly and as independently of all grounds as the existence of our own being, the transcendental philosopher can solve only by the supposition, that the former is unconsciously involved in the latter; that it is not only coherent but identical, and one and the same thing with our own immediate self-consciousness. To demonstrate this identity is the office and object of his philosophy.

If it be said, that this is Idealism, let it be remembered that it is only so far idealism, as it is at the same time, and on that very account, the truest and most binding realism. For wherein does the realism of mankind properly consist? In the assertion that there exists a something without them, what, or how, or where they know not, which occasions the objects of their perception? Oh no! This is neither connatural or universal. It is what a few have taught and learnt in the schools, and which the many repeat without asking themselves concerning their own meaning. The realism common to all mankind is far elder and lies infinitely deeper than this hypothetical explanation of the origin of our perceptions, an explanation skimmed from the mere surface of mechanical philosophy. It is the table itself, which the man of common sense believes himself to see, not the phantom of a table, from which he may argumentatively deduce the reality of a table, which he does not see. If to destroy the reality of all, that we actually behold, be idealism, what can be more egregiously so, than the system of modern metaphysics, which banishes us to a land of shadows, surrounds us with apparitions, and distinguishes truth from illusion only by the majority of those who dream the same dream? "*I* asserted that the world was mad," exclaimed poor Lee, "and the world said, that I was mad, and confound them, they outvoted me."[11]

It is to the true and original realism, that I would direct the attention. This believes and requires neither more nor less, than that the object which it beholds or presents to itself, is the real and very object. In this sense, however much we may strive against it, we are all collectively born idealists, and therefore and only therefore are we at the same time realists. But of this the philosophers of the schools know nothing, or despise the faith as the prejudice of the ignorant vulgar, because they live and move in a crowd of phrases and notions from which human nature has long ago vanished. Oh, ye that reverence yourselves, and walk humbly with the divinity in your own hearts, ye are worthy of a better philosophy! Let the dead bury the dead,[12] but do you preserve your human nature, the depth of which was never yet fathomed by a philosophy made up of notions and mere logical entities.

from
Chapter 13

The IMAGINATION then I consider either as primary, or secondary.[13] The primary IMAGINATION I hold to be the living Power and prime Agent of all human Perception, and as a repetition in the finite mind of the eternal act of creation in the infinite I AM. The secondary I consider as an echo of the former, co-existing with the conscious will, yet still as identical with the primary in the *kind* of its agency, and differing only in *degree,* and in the *mode* of its operation. It dissolves, diffuses, dissipates, in order to re-create; or where this process is rendered impossible, yet still at all events it struggles to idealize and to unify. It is essentially *vital,* even as all objects (*as* objects) are essentially fixed and dead.

---

[10] Horace, *Epistles* 1.10.24: "You may drive nature out with a pitchfork but she will return."

[11] The reference is to the Restoration dramatist, Nathaniel Lee (c. 1653–1692), confined at Bedlam (1684–1689). While many remarks of Lee were published in others' writings, this particular one has not been traced.

[12] Cf. Mic. 6.8: ". . . walk humbly with thy God. . ." Cf. Matt. 8.12; Luke 9.60: "Let the dead bury the dead."

[13] As noted above, this celebrated definition of Imagination, primary and secondary, and Fancy appears in Chapter 13 after Coleridge abruptly breaks off his philosophical argument begun in Chapter 12.

FANCY, on the contrary, has no other counters to play with, but fixities and definites. The Fancy is indeed no other than a mode of Memory emancipated from the order of time and space; and blended with, and modified by that empirical phenomenon of the will, which we express by the word CHOICE. But equally with the ordinary memory it must receive all its materials ready made from the law of association.

Chapter 14

Occasion of the Lyrical Ballads, and the objects originally proposed—Preface to the second edition—The ensuing controversy, its causes and acrimony—Philosophic definitions of a poem and poetry with scholia

During the first year that Mr. Wordsworth and I were neighbours,[14] our conversations turned frequently on the two cardinal points of poetry, the power of exciting the sympathy of the reader by a faithful adherence to the truth of nature, and the power of giving the interest of novelty by the modifying colours of imagination. The sudden charm, which accidents of light and shade, which moon-light or sun-set diffused over a known and familiar landscape, appeared to represent the practicability of combining both. These are the poetry of nature. The thought suggested itself (to which of us I do not recollect) that a series of poems might be composed of two sorts. In the one, the incidents and agents were to be, in part at least, supernatural; and the excellence aimed at was to consist in the interesting of the affections by the dramatic truth of such emotions, as would naturally accompany such situations, supposing them real. And real in *this* sense they have been to every human being who, from whatever source of delusion, has at any time believed himself under supernatural agency. For the second class, subjects were to be chosen from ordinary life; the characters and incidents were to be such, as will be found in every village and its vicinity, where there is a meditative and feeling mind to seek after them, or to notice them, when they present themselves.

In this idea originated the plan of the "Lyrical Ballads," in which it was agreed, that my endeavours should be directed to persons and characters supernatural, or at least romantic; yet so as to transfer from our inward nature a human interest and a semblance of truth sufficient to procure for these shadows of imagination that willing suspension of disbelief for the moment, which constitutes poetic faith. Mr. Wordsworth, on the other hand, was to propose to himself as his object, to give the charm of novelty to things of every day, and to excite a feeling analogous to the supernatural, by awakening the mind's attention from the lethargy of custom, and directing it to the loveliness and the wonders of the world before us; an inexhaustible treasure, but for which in consequence of the film of familiarity[15] and selfish solicitude we have eyes, yet see not, ears that hear not, and hearts that neither feel nor understand.[16]

With this view I wrote the "Ancient Mariner," and was preparing among other poems, the "Dark Ladie," and the "Christabel," in which I should have more nearly realized my ideal, than I had done in my first attempt.[17] But Mr. Wordsworth's industry had proved so much more successful, and the number of his poems so much greater, that my compositions, instead of forming a balance, appeared rather an interpolation of heterogeneous matter. Mr. Wordsworth added two or three poems written in his own character, in the impassioned, lofty, and sustained diction, which is characteristic of his genius.[18] In this form the "Lyrical Ballads" were published; and were presented by him, as an *experiment,* whether subjects, which from their nature rejected the usual ornaments and extra-colloquial style of poems in general, might not be so managed in the language of ordinary life as to produce the pleasurable interest, which it is the peculiar business of poetry to impart. To the second edition he added a preface of considerable length; in which notwithstanding some passages of apparently a contrary import, he was understood to contend for the extension of this style to poetry of all kinds, and to reject as vicious and indefensible all phrases and forms of style that were not included in what he (unfortunately, I think, adopting an equivocal expression) called the language of *real* life.[19] From this preface, prefixed to poems in which it was impossible to deny the presence of original genius, however mistaken its direction might be deemed, arose the whole long continued controversy. For from the conjunction of perceived power with supposed heresy I explain the inveteracy and in some instances, I grieve to say, the acrimonious passions, with which the controversy has been conducted by the assailants.[20]

---

[14] 1797–1798, while Wordsworth lived at Alfoxden House and Coleridge at Nether Stowey.

[15] Shelley appropriated this metaphor in his "Defense of Poetry" (below, page 542).

[16] Cf. Jer. 5.21; Isa. 6.10.

[17] "Christabel" was at that time unfinished, and was not published until 1816.

[18] That is, "Lines Composed above Tintern Abbey," and one or two including "Lines Written at a Small Distance from My House," "Lines Written in Early Spring," "Expostulation and Reply," and "The Tables Turned."

[19] Wordsworth's phrase was actually, ". . . a selection of the real language of men in a state of vivid sensation . . ." See above, page 482.

Had Mr. Wordsworth's poems been the silly, the childish things, which they were for a long time described as being; had they been really distinguished from the compositions of other poets merely by meanness of language and inanity of thought; had they indeed contained nothing more than what is found in the parodies and pretended imitations of them; they must have sunk at once, a dead weight, into the slough of oblivion, and have dragged the preface along with them. But year after year increased the number of Mr. Wordsworth's admirers. They were found too not in the lower classes of the reading public, but chiefly among young men of strong sensibility and meditative minds; and their admiration (inflamed perhaps in some degree by opposition) was distinguished by its intensity, I might almost say, by its *religious* fervour. These facts, and the intellectual energy of the author, which was more or less consciously felt, where it was outwardly and even boisterously denied, meeting with sentiments of aversion to his opinions, and of alarm at their consequences, produced an eddy of criticism, which would of itself have borne up the poems by the violence, with which it whirled them round and round. With many parts of this preface in the sense attributed to them and which the words undoubtedly seem to authorise, I never concurred; but on the contrary objected to them as erroneous in principle, and as contradictory (in appearance at least) both to other parts of the same preface, and to the author's own practice in the greater number of the poems themselves. Mr. Wordsworth in his recent collection has, I find, degraded this prefatory disquisition to the end of his second volume,[21] to be read or not at the reader's choice. But he has not, as far as I can discover, announced any change in his poetic creed. At all events, considering it as the source of a controversy, in which I have been honored more, than I deserve, by the frequent conjunction of my name with his, I think it expedient to declare once for all, in what points I coincide with his opinions, and in what points I altogether differ. But in order to render myself intelligible I must previously, in as few words as possible, explain my ideas, first, of a POEM; and secondly, of POETRY itself, in *kind,* and in *essence.*

The office of philosophical *disquisition* consists in just *distinction;* while it is the priviledge of the philosopher to preserve himself constantly aware, that distinction is not division. In order to obtain adequate notions of any truth, we must intellectually separate its distinguishable parts; and this is the technical *process* of philosophy. But having so done, we must then restore them in our conceptions to the unity, in which they actually co-exist; and this is the *result* of philosophy. A poem contains the same elements as a prose composition; the difference therefore must consist in a different combination of them, in consequence of a different object proposed. According to the difference of the object will be the difference of the combination. It is possible, that the object may be merely to facilitate the recollection of any given facts or observations by artificial arrangement; and the composition will be a poem, merely because it is distinguished from prose by metre, or by rhyme, or by both conjointly. In this, the lowest sense, a man might attribute the name of a poem to the well known enumeration of the days in the several months;

> Thirty days hath September,
> April, June, and November, &c.

and others of the same class and purpose. And as a particular pleasure is found in anticipating the recurrence of sounds and quantities, all compositions that have this charm superadded, whatever be their contents, *may* be entitled poems.

So much for the superficial *form.* A difference of object and contents supplies an additional ground of distinction. The immediate purpose may be the communication of truths; either of truth absolute and demonstrable, as in works of science; or of facts experienced and recorded, as in history. Pleasure, and that of the highest and most permanent kind, may *result* from the *attainment* of the end; but it is not itself the immediate end. In other works the communication of pleasure may be the immediate purpose; and though truth, either moral or intellectual, ought to be the *ultimate* end, yet this will distinguish the character of the author, not the class to which the work belongs. Blest indeed is that state of society, in which the immediate purpose would be baffled by the perversion of the proper ultimate end; in which no charm of diction or imagery could exempt the Bathyllus even of an Anacreon, or the Alexis of Virgil,[22] from disgust and aversion!

---

[20] Coleridge's primary reference is to attacks in the *Edinburgh Review* by Francis Jeffrey, from 1802 to 1814–1815.

[21] Cf. *Poems by William Wordsworth: Including Lyrical Ballads, and the Miscellaneous Pieces of the Author, with Additional Poems, a New Preface, and a Supplementary Essay,* in two volumes, 1815.

[22] Bathyllus of Samos, a youth loved by Anacreon; Ode 29 (17). Alexis is the youth loved by Corydon in Virgil's *Eclogue 2.*

But the communication of pleasure may be the immediate object of a work not metrically composed; and that object may have been in a high degree attained, as in novels and romances. Would then the mere superaddition of metre, with or without rhyme, entitle *these* to the name of poems? The answer is, that nothing can permanently please, which does not contain in itself the reason why it is so, and not otherwise. If metre be superadded, all other parts must be made consonant with it. They must be such, as to justify the perpetual and distinct attention to each part, which an exact correspondent recurrence of accent and sound are calculated to excite. The final definition then, so deduced, may be thus worded. A poem is that species of composition, which is opposed to works of science, by proposing for its *immediate* object pleasure, not truth; and from all other species (having *this* object in common with it) it is discriminated by proposing to itself such delight from the *whole,* as is compatible with a distinct gratification from each component *part.*

Controversy is not seldom excited in consequence of the disputants attaching each a different meaning to the same word; and in few instances has this been more striking, than in disputes concerning the present subject. If a man chooses to call every composition a poem, which is rhyme, or measure, or both, I must leave his opinion uncontroverted. The distinction is at least competent to characterize the writer's intention. If it were subjoined, that the whole is likewise entertaining or affecting, as a tale, or as a series of interesting reflections, I of course admit this as another fit ingredient of a poem, and an additional merit. But if the definition sought for be that of a *legitimate* poem, I answer, it must be one, the parts of which mutually support and explain each other; all in their proportion harmonizing with, and supporting the purpose and known influences of metrical arrangement. The philosophic critics of all ages coincide with the ultimate judgement of all countries, in equally denying the praises of a just poem, on the one hand, to a series of striking lines or distichs, each of which absorbing the whole attention of the reader to itself disjoins it from its context, and makes it a separate whole, instead of an harmonizing part; and on the other hand, to an unsustained composition, from which the reader collects rapidly the general result unattracted by the component parts. The reader should be carried forward, not merely or chiefly by the mechanical impulse of curiosity, or by a restless desire to arrive at the final solution; but by the pleasureable activity of mind excited by the attractions of the journey itself. Like the motion of a serpent, which the Egyptians made the emblem of intellectual power; or like the path of sound through the air; at every step he pauses and half recedes, and from the retrogressive movement collects the force which again carries him onward. Precipitandus est *liber* spiritus, says Petronius Arbiter most happily.[23] The epithet, *liber,* here balances the preceding verb; and it is not easy to conceive more meaning condensed in fewer words.

But if this should be admitted as a satisfactory character of a poem, we have still to seek for a definition of poetry. The writings of PLATO, and Bishop TAYLOR, and the Theoria Sacra of BURNET,[24] furnish undeniable proofs that poetry of the highest kind may exist without metre, and even without the contradistinguishing objects of a poem. The first chapter of Isaiah (indeed a very large proportion of the whole book) is poetry in the most emphatic sense; yet it would be not less irrational than strange to assert, that pleasure, and not truth, was the immediate object of the prophet. In short, whatever *specific* import we attach to the word, poetry, there will be found involved in it, as a necessary consequence, that a poem of any length neither can be, or ought to be, all poetry.[25] Yet if an harmonious whole is to be produced, the remaining parts must be preserved *in keeping* with the poetry; and this can be no otherwise effected than by such a studied selection and artificial arrangement, as will partake of *one,* though not a *peculiar,* property of poetry. And this again can be no other than the property of exciting a more continuous and equal attention, than the language of prose aims at, whether colloquial or written.

My own conclusions on the nature of poetry, in the strictest use of the word, have been in part anticipated in the preceding disquisition on the fancy and imagination. What is poetry? is so nearly the same question with, what is a poet? that the answer to the one is involved in the solution of the other. For it is a distinction resulting from the poetic genius itself, which sustains and modifies the images, thoughts, and emotions of the poet's own mind. The poet, described in *ideal* perfection, brings the whole soul of man into activity, with the subordination of its faculties to each other, according to their relative worth and dignity. He diffuses a tone, and spirit of unity, that blends, and (as it were) *fuses,* each into each, by that synthetic and magical power, to which we have exclusively appropriated the name of imagination. This power, first put in action by the will and understanding, and retained under their irremissive, though gentle and unnoticed, controul *(laxis effertur habenis)*[26] reveals itself in the balance or reconciliation of opposite or discordant qualities:[27] of sameness, with difference; of the general, with the concrete; the idea, with the image; the individual, with the representative; the sense of novelty and freshness, with old and familiar objects; a more than usual state of emotion, with more than usual order; judgement ever awake and steady self-possession, with enthusiasm and feeling profound or vehement; and while it blends and harmonizes the natural and the artificial, still subordinates art to nature; the manner to the matter; and our admiration of the poet to our sympathy with the poetry. "Doubtless," as Sir John Davies observes of the soul (and his words may with slight alteration be applied, and even more appropriately to the poetic IMAGINATION.)

---

[23] "The *free* spirit must be hurried forward" from *Satyricon* 118, by Petronius Arbiter, Roman consul during the reign of Nero.

[24] Jeremy Taylor (1613–1667), Anglican clergyman and writer; Thomas Burnet (1635–1715), author of *Sacred Theory of the Earth* (1684–1689).

[25] See Edgar Allan Poe's elaboration of this point in "The Poetic Principle" (below, page 581).

> Doubtless this could not be, but that she turns
> Bodies to spirit by sublimation strange,
> As fire converts to fire the things it burns,
> As we our food into our nature change.
>
> From their gross matter she abstracts their forms,
> And draws a kind of quintessence from things;
> Which to her proper nature she transforms
> To bear them light, on her celestial wings.
>
> Thus does she, when from individual states
> She doth abstract the universal kinds;
> Which then re-clothed in divers names and fates
> Steal access through our senses to our minds.[28]

Finally, GOOD SENSE is the BODY of poetic genius, FANCY its DRAPERY, MOTION its LIFE, and IMAGINATION the SOUL that is every where, and in each; and forms all into one graceful and intelligent whole.

Essays on the Principles of Method

from
Essay IV[1]

What is that which first strikes us, and strikes us at once, in a man of education? And which, among educated men, so instantly distinguishes the man of superior mind, that (as was observed with eminent propriety of the late Edmund Burke) "we cannot stand under the same arch-way during a shower of rain, *without finding him out?*"[2] Not the weight or novelty of his remarks; not any unusual interest of facts communicated by him; for we may suppose both the one and the other precluded by the shortness of our intercourse, and the triviality of the subjects. The difference will be impressed and felt, though the conversation should be confined to the state of the weather or the pavement. Still less will it arise from any peculiarity in his words and phrases. For if he be, as we now assume, a *well*-educated man as well as a man of superior powers, he will not fail to follow the golden rule of Julius Cæsar, *Insolens verbum, tanquam scopulum, evitare.*[3] Unless where new things necessitate new terms, he will avoid an unusual word as a rock. It must have been among the earliest lessons of his youth, that the breach of this precept, at all times hazardous, becomes ridiculous in the topics of ordinary conversation. There remains but one other point of distinction possible; and this must be, and in fact is, the true cause of the impression made on us. It is the unpremeditated and evidently habitual *arrangement* of his words, grounded on the habit of foreseeing, in each integral part, or (more plainly) in every sentence, the whole that he then intends to communicate. However irregular and desultory his talk, there is *method* in the fragments.

Listen, on the other hand, to an ignorant man, though perhaps shrewd and able in his particular calling; whether he be describing or relating. We immediately perceive, that his memory alone is called into action; and that the objects and events recur in the narration in the same order, and with the same accompaniments, however accidental or impertinent, as they had first occurred to the narrator. The necessity of taking breath, the efforts of recollection, and the abrupt rectification of its failures, produce all his pauses; and with exception of the *"and then,"* the *"and there,"* and the still less significant, *"and so,"* they constitute likewise all his connections.

---

[26] "Carried on with slackened reins," quoted from Petrarch, *Epistola Barbato Sulmonensi,* ln. 39.

[27] For many of the New Critics, this idea was adopted as essential to the character of poetry. See especially Cleanth Brooks, below page 1037.

[28] Sir John Davies (1570–1626), from *Nosce Teipsum: Of the Soule of Man and the Immortalitie Thereof* (1599), though Coleridge is quoting the lines as he had transcribed (and partly rewritten) them in his own notebook entry of 1811 (*Notebooks* III, 4112; see *The Notebooks of Samuel Taylor Coleridge,* Kathleen Coburn, ed.). Davies's third stanza originally read: "This does she, when from things particular / She doth abstract the universall kinds, / Which bodilesse and immateriall are, / And can be lodg'd but onely in our minds."

"Essays on the Principles of Method" from *The Friend* (1818). Reprinted here from Barbara E. Rooke, ed., *The Friend* (Princeton: Princeton University Press, 1969).

[1] A shorter version of these essays was published earlier in January 1818, as "Essay on Method" in the *Encyclopedia Metropolitana.*

[2] This remark is from Samuel Johnson, quoted (without attribution). See *Boswell's Life of Johnson,* edited by G. Birbeck Hill and L. F. Powell (Oxford, 1934–1950) IV, 275.

[3] Coleridge abbreviates and freely translates in the next sentence the report of Aulus Gellius in *Noctes Atticae* 1.10.4. See also *Biographia Literaria,* I 6, for another use of this passage.

* * *

The difference between the products of a well-disciplined and those of an uncultivated understanding, in relation to what we will now venture to call the *Science of Method,* is often and admirably exhibited by our great Dramatist. We scarcely need refer our readers to the Clown's evidence, in the first scene of the second act of "Measure for Measure," or the Nurse in "Romeo and Juliet." But not to leave the position, without an instance to illustrate it, we will take the "easy-yielding" Mrs. Quickley's relation of the circumstances of Sir John Falstaff's debt to her.

Falstaff What is the gross sum that I owe thee?

Mrs. Quickley Marry, if thou wert an honest man, thyself and the money too. Thou didst swear to me upon a parcel-gilt goblet, sitting in my dolphin chamber, at the round table, by a sea-coal fire, on Wednesday in Whitsun week, when the prince broke thy head for likening his father to a singing-man in Windsor—thou didst swear to me then, as I was washing thy wound, to marry me and make me my lady thy wife. Canst thou deny it? Did not goodwife Keech, the butcher's wife, come in then and call me gossip Quickley?—coming into borrow a mess of vinegar: telling us she had a good dish of prawns—whereby thou didst desire to eat some—whereby I told thee they were ill for a green wound, &c. &c. &c.[4]

And this, be it observed, is so far from being carried beyond the bounds of a fair imitation, that "the poor soul's" thoughts and sentences are more closely interlinked than the truth of nature would have required, but that the connections and sequence, which the habit of Method can alone give, have in this instance a substitute in the fusion of passion. For the absence of Method, which characterizes the uneducated, is occasioned by an habitual submission of the understanding to mere events and images as such, and independent of any power in the mind to classify or appropriate them. The general accompaniments of time and place are the only relations which persons of this class appear to regard in their statements. As this constitutes *their* leading feature, the contrary excellence, as distinguishing the well-educated man, must be referred to the contrary habit. METHOD, therefore, becomes natural to the mind which has been accustomed to contemplate not *things* only, or for their own sake alone, but likewise and chiefly the *relations* of things, either their relations to each other, or to the observer, or to the state and apprehension of the hearers. To enumerate and analyze these relations, with the conditions under which alone they are discoverable, is to teach the science of Method.

The enviable results of this science, when knowledge has been ripened into those habits which at once secure and evince its possession, can scarcely be exhibited more forcibly as well as more pleasingly, than by contrasting with the former extract from Shakspeare the narration given by Hamlet to Horatio of the occurrences during his proposed transportation to England, and the events that interrupted his voyage.

HAMLET Sir, in my heart there was a kind of fighting
That would not let me sleep: methought I lay
Worse than the mutines in the bilboes. Rashly,
And prais'd be rashness for it—*Let us know,*
Our indiscretion sometimes serves us well,
When our deep plots do fall: and that should teach us,
There's a divinity that shapes our ends,
Rough-hew them how we will.
HORATIO That is most certain.
HAMLET Up from my cabin,
My sea-gown scarf'd about me, in the dark
Grop'd I to find out them; had my desire;
Finger'd their pocket; and, in fine, withdrew
To my own room again: making so bold,
My fears forgetting manners, to unseal
Their grand commission; where *I* found, Horatio,
A royal knavery—an exact command,
Larded with many several sorts of reasons,
Importing Denmark's health, and England's too,
With, ho! such bugs and goblins in *my* life,
That on the supervize, no leisure bated,
No, not to stay the grinding of the axe,
My head should be struck off!
HORATIO Is't possible?
HAMLET Here's the commission.—Read it at more leisure.[5]

Here the events, with the circumstances of time and place, are all stated with equal compression and rapidity, not one introduced which could have been omitted without injury to the intelligibility of the whole process. If any tendency is discoverable, as far as the mere facts are in question, it is the tendency to omission: and, accordingly, the reader will observe, that the attention of the narrator is called back to one material circumstance, which he was hurrying by, by a direct question from the friend to whom the story is communicated, "HOW WAS THIS SEALED?" But by a trait which is indeed peculiarly characteristic of Hamlet's mind, ever disposed to generalize, and meditative to excess (but which, with due abatement and reduction, is distinctive of every powerful and methodizing intellect), all the digressions and enlargements consist of reflections, truths, and principles of general and permanent interest, either directly expressed or disguised in playful satire.

---

[4] Shakespeare, *Henry IV, part II,* II, i, 80–93.

[5] *Hamlet* V, ii, 4–26, with variations.

I sat me down;
Devis'd a new commission; wrote it fair.
I once did hold it, as our statists do,
A baseness to write fair, and laboured much
How to forget that learning; but, sir, now
It did me yeoman's service. Wilt thou know
The effect of what I wrote?
HORATIO Aye, good my lord.
HAMLET An earnest conjuration from the king,
As England was his faithful tributary;
As love between them, like the palm, might flourish;
As peace should still her wheaten garland wear,
And many such like As's of great charge—
That on the view and knowing of these contents
He should the bearers put to sudden death,
No shriving time allowed.
HORATIO How was this sealed?
HAMLET Why, even in that was heaven ordinant.
I had my father's signet in my purse,
Which was the model of that Danish seal:
Folded the writ up in the form of the other;
Subscribed it; gave't the impression; placed it safely,
The changeling never known. Now, the next day
Was our sea-fight; and what to this was sequent,
Thou knowest already.
HORATIO So Guildenstern and Rosencrantz go to't?
HAMLET Why, man, they did make love to this employment.
They are not near my conscience: their defeat
Doth by their own insinuation grow.
'Tis dangerous when the baser nature comes
Between the pass and fell incensed points
Of mighty opposites.[6]

It would, perhaps, be sufficient to remark of the preceding passage, in connection with the humorous specimen of narration,

Fermenting o'er with frothy circumstance,[7]

in Henry IV.; that if overlooking the different value of the *matter* in each, we considered the *form* alone, we should find both *immethodical;* Hamlet from the excess, Mrs. Quickley from the want, of reflection and generalization; and that Method, therefore, must result from the due mean or balance between our passive impressions and the mind's own re-action on the same. (Whether this re-action do not suppose or imply a primary act positively *originating* in the mind itself, and prior to the object in order of nature, though co-instantaneous in its manifestation, will be hereafter discussed.) But we had a further purpose in thus contrasting these extracts from our "myriad-minded Bard," (μυριονοῦς ἄνηρ.)[8] We wished to bring forward, each for itself, these two elements of Method, or (to adopt an arithmetical term) its two main *factors.*

Instances of the want of generalization are of no rare occurrence in real life: and the narrations of Shakspeare's Hostess and the Tapster,[9] differ from those of the ignorant and unthinking in general, by their superior humor, the poet's own gift and infusion, not by their want of Method, which is not greater than we often meet with in that class, of which they are the dramatic representatives. Instances of the opposite fault, arising from the excess of generalization and reflection in minds of the opposite class, will, like the minds themselves, occur less frequently in the course of our own personal experience. Yet they will not have been wanting to our readers, nor will they have passed unobserved, though the great poet himself (ὁ τὴν ἑαυτοῦ ψυχὴν ὡσεί ὕλην τινα ἀσώματον μορφαῖς ποικιλαῖς μορφώσας)[10] has more conveniently supplied the illustrations. To complete, therefore, the purpose aforementioned, that of presenting each of the two components as separately as possible, we chose an instance in which, by the surplus of its own activity, Hamlet's mind disturbs the arrangement, of which that very activity had been the cause and impulse.

---

[7] The source has not been identified.

[8] "Myriad-minded man"; cf. William Cave, *Scriptorum ecclesiasticorum historia literaria* (1688), and *Notebooks* I, 1070.

[9] That is, Mistress Quickly (see above); and Pompey the clown in *Measure for Measure* II, i.

[10] "He that moulded his own soul, as some incorporeal material, into various forms." Coleridge's translation from Themistius, *Paraphrase of Aristotle on the Soul,* 3.8.

Thus exuberance of mind, on the one hand, interferes with the *forms* of Method; but sterility of mind, on the other, wanting the spring and impulse to mental action, is wholly destructive of Method itself. For in attending too exclusively to the relations which the past or passing events and objects bear to general truth, and the moods of his own Thought, the most intelligent man is sometimes in danger of overlooking that other relation, in which they are likewise to be placed to the apprehension and sympathies of his hearers. His discourse appears like soliloquy intermixed with dialogue. But the uneducated and unreflecting talker overlooks *all* mental relations, both logical and psychological; and consequently precludes all Method, that is not purely accidental. Hence the nearer the things and incidents in time and place, the more distant, disjointed, and impertinent to each other, and to any common purpose, will they appear in his narration: and this from the want of a *staple,* or *starting-post,* in the narrator himself; from the absence of *the leading Thought,* which, borrowing a phrase from the nomenclature of legislation, we may not inaptly call the INITIATIVE. On the contrary, where the habit of Method is present and effective, things the most remote and diverse in time, place, and outward circumstance, are brought into mental contiguity and succession, the more striking as the less expected. But while we would impress the necessity of this habit, the illustrations adduced give proof that in undue preponderance, and when the prerogative of the mind is stretched into despotism, the discourse may degenerate into the grotesque or the fantastical.

* * *

We have seen that from the confluence of innumerable impressions in each moment of time the mere passive memory must needs tend to confusion—a rule, the seeming exceptions to which (the thunder-bursts in Lear, for instance) are really confirmations of its truth. For, in many instances, the predominance of some mighty Passion takes the place of the guiding Thought, and the result presents the method of Nature, rather than the habit of the Individual. For Thought, Imagination (and we may add, Passion), are, in their very essence, the first, connective, the latter co-adunative: and it has been shown, that if the excess lead to Method misapplied, and to connections of the moment, the absence, or marked deficiency, either precludes Method altogether, both form and substance: or (as the following extract will exemplify) retains the outward form only.

My liege and madam! to expostulate
What majesty should be, what duty is,
Why day is day, night night, and time is time,
Were nothing but to waste night, day and time.
Therefore—since brevity is the soul of wit,
And tediousness the limbs and outward flourishes,
I will be brief. Your noble son is mad:
Mad call I it—for to define true madness,
What is't, but to be nothing else but mad!
But let that go.
QUEEN *More matter with less art.*
POLONIUS *Madam! I swear, I use no art at all.*
That he is mad, tis true: tis true, tis pity:
And pity tis, tis true (a foolish figure!
But farewell it, for I will use no art.)
Mad let us grant him then! and now remains,
That we find out the cause of this effect,
Or rather say the cause of this defect:
For this effect defective comes by cause.
Thus it remains, and the remainder thus
Perpend![11]

Does not the irresistible sense of the ludicrous in this flourish of the soul-surviving body of old Polonius's intellect, not less than in the endless confirmations and most undeniable matters of fact, of Tapster Pompey or "the hostess of the tavern" prove to our feelings, even before the word is found which presents the truth to our understandings, that confusion and formality are but the opposite poles of the same null-point?

It is Shakspeare's peculiar excellence, that throughout the whole of his splendid picture gallery (the reader will excuse the confest inadequacy of this metaphor), we find individuality every where, mere portrait no where. In all his various characters, we still feel ourselves communing with the same human nature, which is every where present as the vegetable sap in the branches, sprays, leaves, buds, blossoms, and fruits, their shapes, tastes, and odours. Speaking of the effect, i.e. his works themselves, we may define the excellence of *their* method as consisting in that just proportion, that union and interpenetration of the universal and the particular, which must ever pervade all works of decided genius and true science. For Method implies a *progressive transition,* and it is the meaning of the word in the original language. The Greek Μεθοδος, is literally *a way,* or *path of Transit.* Thus we extol the Elements of Euclid, or Socrates' discourse with the slave in the Menon,[12] as *methodical,* a term which no one who holds himself bound to think or speak correctly, would apply to the alphabetical order or arrangement of a common dictionary. But as, without continuous transition, there can be no Method, so without a pre-conception there can be no transition with continuity. The term, Method, cannot therefore, otherwise than by abuse, be applied to a mere dead arrangement, containing in itself no principle of progression.

from Essay V

It has been observed, in a preceding page, that the RELATIONS of objects are prime *materials* of Method, and that the contemplation of relations is the indispensible condition of thinking methodically. It becomes necessary therefore to add, that there are two kinds of relation, in which objects of mind may be contemplated. The first is that of LAW, which, in its absolute perfection, is conceivable only of the Supreme Being, whose creative IDEA not only appoints to each thing its *position,* but in that position, and in consequence of that position, gives it its qualities, yea, it gives its very existence, as *that particular* thing.[13] Yet in whatever science the relation of the parts to each other and to the whole is predetermined by a truth originating in the *mind,* and not abstracted or generalized from observation of the parts, there we affirm the presence of a *law,* if we are speaking of the physical sciences, as of Astronomy for instance; or the presence of fundamental *ideas,* if our discourse be upon those sciences, the truths of which, as truths absolute, not merely have an independent *origin* in the mind, but continue to exist in and for the mind alone. Such, for instance, is Geometry, and such are the ideas of a perfect circle, of asymptots, &c.[14]

We have thus assigned the first place in the science of Method to LAW; and first of the first, to *Law,* as the absolute *kind* which comprehending in itself the substance of every possible degree precludes from its conception all degree, not by generalization but by its own plenitude. As such, therefore, and as the sufficient cause of the reality correspondent thereto, we contemplate it as exclusively an attribute of the Supreme Being, inseparable from the idea of God: adding, however, that from the contemplation of law in this, its only perfect form, must be derived all true insight into all other grounds and principles necessary to Method, as the science common to all sciences, which in each τυγχάνει ὄν ἄλλο αὐτῆς τῆς ἐπιστήμης.[15] Alienated from this (intuition shall we call it? or stedfast faith?) ingenious men may produce schemes, conducive to the peculiar purposes of particular sciences, but no scientific system.

* * *

The grand problem, the solution of which forms, according to Plato, the final object and distinctive character of philosophy, is this: *for all that exists conditionally* (i.e. the existence of which is inconceivable except under the condition of its dependency on some other as its antecedent) *to find a ground that is unconditional and absolute, and thereby to reduce the aggregate of human knowledge to a system.* For the relation common to all being known, the appropriate orbit of each becomes discoverable, together with its peculiar relations to its concentrics in the common sphere of subordination. Thus the centrality of the sun having been established, and the law of the distances of the planets from the sun having been determined, we possess the means of calculating the distance of each from the other. But as all objects of sense are in continual flux, and as the notices of them by the senses must, as far as they are true notices, change with them, while scientific principles (or laws) are no otherwise principles of science than as they are permanent and always the same, the latter were appropriated to the pure reason, either as its products or as[*] implanted in it. And now the remarkable fact forces itself on our attention, viz. that the material world is found to obey the same laws as had been deduced independently from the reason: and that the masses act by a force, which cannot be conceived to result from the component parts, known or imaginable. In the phænomena of magnetism, electricity, galvanism, and in chemistry generally, the mind is led instinctively, as it were, to regard the working powers as conducted, transmitted, or accumulated by the sensible bodies, and not as inherent. This fact has, at all times, been the strong hold alike of the materialists and of the spiritualists, equally solvable by the two contrary hypotheses, and fairly solved by neither. In the clear and masterly† review of the elder philosophies, which must be ranked among the most splendid proofs of judgment no less than of genius, and more expressly in the critique on the atomic or corpuscular doctrine of Democritus and his followers, as the one extreme, and that of the pure rationalism of Zeno and the Eleatic school as the other,[18] Plato has proved incontrovertibly, that in both alike the basis is too narrow to support the superstructure; that the grounds of both are false or disputable; and that, if these were conceded, yet neither the one nor the other is adequate to the solution of the problem: viz. what is the ground of the coincidence between reason and experience? Or between the laws of matter and the ideas of the pure intellect? The only answer which Plato deemed the question capable of receiving, compels the reason to pass out of itself and seek the ground of this agreement in a supersensual essence, which being at once the *ideal* of the reason and the cause of the material world, is the pre-establisher of the harmony in and between both. Religion therefore is the ultimate aim of philosophy, in consequence of which philosophy itself becomes the supplement of the sciences, both as the convergence of all to the common end, namely, wisdom; and as supplying the copula, which modified in each in the comprehension of its parts to one whole, is in its principles common to all, as integral parts of one system. And this is METHOD, itself a distinct science, the immediate offspring of philosophy, and the link or *mordant*[19] by which philosophy becomes scientific and the sciences philosophical.

---

[13] It should especially be noted here that Coleridge's use of "Law" is here quite distinct from the sense of the term that is associated with a rule: the *law* of a particular thing is its nature; it is, in brief, *itself,* regarded as the principle of its own reality. See below Coleridge's discussion of "Idea" in *On the Constitution of Church and State* (page 519).

[14] In Coleridge's notes in two copies (A and D), he warns against the error of forgetting that the terms Idea and Law are, as he uses them, always correlative, and that in the case of geometry, the appropriate term is not *Idea* but *Theorem.*

[15] Coleridge's translation: "May prove to be something more than the mere aggregate of the knowledges in any particular science." The passage in question, which Coleridge uses as an epigraph to Essay VII, is a composite drawn from Tenneman's *History of Philosophy* II, 242–3, conflating two passages drawn from Plato's *Republic,* 476a–d, and *Charmides,* 166a.

[*] Which of these two doctrines was Plato's own opinion, it is hard to say. In many passages of his works, the latter (i.e. the doctrine of innate, or rather of connate, ideas) *seems* to be it; but from the character and avowed purpose of these works, as addressed to a promiscuous public, and therefore preparatory and for the discipline of the mind rather than directly doctrinal, it is not improbable that Plato chose it as the more popular representation, and as belonging to the poetic drapery of his Philosophemata.

from
Essay VI

‘Απάντων ζητοῦντες λόγον ἔξωθεν, ἀναιροῦσι λόγον.
THEOPH. *in Met.*

Seeking the reason of all things from without, they preclude reason.

The second relation is that of THEORY, in which the existing forms and qualities of objects, discovered by observation or experiment, suggest a given arrangement of many under one point of view: and this not merely or principally in order to facilitate the remembrance, recollection, or communication of the same; but for the purposes of understanding, and in most instances of controlling, them. In other words, all THEORY supposes the general idea of cause and effect. The scientific arts of Medicine, Chemistry, and of Physiology in general, are examples of a method hitherto founded on this second sort of relation.

Between these two lies the Method in the FINE ARTS,[20] which belongs indeed to this second or external relation, because the effect and position of the parts is always more or less influenced by the knowledge and experience of their previous qualities; but which nevertheless constitute a link connecting the second form of relation with the first. For in all, that truly merits the name of *Poetry* in its most comprehensive sense, there is a necessary predominance of the Ideas (i.e. of that which originates in the artist himself), and a comparative indifference of the materials. A true musical taste is soon dissatisfied with the Harmonica, or any similar instrument of glass or steel, because the *body* of the sound (as the Italians phrase it), or that effect which is derived from the *materials*, encroaches too far on the effect from the *proportions* of the notes, or that which is *given* to Music by the mind. To prove the high value as well as the superior dignity of the first relation; and to evince, that on this alone a *perfect* Method can be grounded, and that the Methods attainable by the second are at best but approximations to the first, or tentative exercises in the hope of discovering it, form the first object of the present disquisition.

---

† I can conceive no better remedy for the overweening self-complacency of modern philosophy, than the annulment of its pretended originality. The attempt has been made by Dutens,[16] but he failed in it by flying to the opposite extreme. When he should have confined himself to the philosophies, he extended his attack to the sciences and even to the main discoveries of later times: and thus instead of vindicating the ancients, he became the calumniator of the moderns: as far at least as detraction is calumny. It is my intention to give a course of lectures[17] in the course of the present season, comprizing the origin, and progress, the fates and fortunes of philosophy, from Pythagoras to Locke, with the lives and succession of the philosophers in each sect: tracing the progress of speculative science chiefly in relation to the gradual development of the human mind, but without omitting the favorable or inauspicious influence of circumstances and the accidents of individual genius. . . .

[16] Louis Dutens (1730–1812); member of the Royal Society and editor of Leibnitz *Opera Omnia* (1768). The work to which Coleridge refers is *Recherches sur l'origine des découvertes attribuées aux modernes* (1766, 1769).

[17] Coleridge's Philosophical Lectures were delivered in December 1814 and March 1819.

[18] Democritus (c. 460–370 B.C.), Greek philosopher who systematized the thought of his teacher, Leucippus (fl. fifth century B.C., at Miletus), concerning the constitution of reality, composed of the Void and an infinite number of Atoms from which the physical universe is constructed. Zeno of Elea (c. 495–370 B.C.), student of Parmenides (born c. 515 B.C.), the founder and leader of the "Eleatic School." Parmenides argued that all reality is comprised in "the One," and that one should never assert the existence of that which is not. Aristotle credits Zeno with the invention of dialectic, but he is best known for his celebrated paradoxes concerning movement (for example, Achilles and the Tortoise) and the one.

[19] Coleridge derives this sense from the *mordant* as a substance that enables dye to bond more permanently to fabric. This passage is cited in the OED.

[20] It is important to note here that Coleridge is placing Method in the Fine Arts "between" the *relations* respectively of *Law* and *Theory*, but associating it with the latter as an "external relation." The point of this distinction is that a theory is an arrangement of forms and qualities of objects "under one point of view" and as such should not be confused with any putative law of nature. A theory is, rather, a presentation that facilitates the cognition of the *Idea*, not a specification of the *Law*. As the relations in question pertain to *Ideas*, a theory is hypothetical and/or provisional in the sense that it allows one to state or see explanatory (that is, causal) relations perspicuously. Thus Coleridge does not presume any fundamental difference between poetry and science, but rather a difference in their materials and their ends or purposes.

These truths we have (as the most pleasing and popular mode of introducing the subject) hitherto illustrated from Shakspeare. But the same truths, namely the necessity of a mental Initiative to all Method, as well as a careful attention to the conduct of the mind in the exercise of Method itself, may be equally, and here perhaps more characteristically, proved from the most familiar of the SCIENCES. We may draw our elucidation even from those which are at present fashionable among us: from BOTANY or from CHEMISTRY. In the lowest attempt at a methodical arrangement of the former science, that of artificial classification for the preparatory purpose of a nomenclature, some *antecedent* must have been contributed by the mind itself; some *purpose* must be in view; or some question at least must have been proposed to nature, grounded, as all questions are, upon *some* idea[21] of the answer. As for instance, the assumption,

> That two great sexes animate the world.[22]

For no man can confidently conceive a fact to be *universally* true who does not with equal confidence anticipate its *necessity*, and who does not believe that necessity to be demonstrable by an insight into its nature, whenever and wherever such insight can be obtained. We acknowledge, we reverence the obligations of Botany to Linnæus,[23] who, adopting from Bartholinus[24] and others the sexuality of plants, grounded thereon a scheme of classific and distinctive marks, by which one man's experience may be communicated to others, and the objects safely reasoned on while absent, and recognized as soon as and wherever they are met with. He invented a universal character for the language of Botany chargeable with no greater imperfections than are to be found in the alphabets of every particular language. As for the study of the ancients, so of the works of nature, an accidence and a dictionary are the first and indispensable requisites: and to the illustrious Swede, Botany is indebted for both. But neither was the central idea of vegetation itself, by the light of which we might have seen the collateral relations of the vegetable to the inorganic and to the animal world; nor the constitutive nature and inner necessity of sex itself, revealed to Linnæus.[25]* Hence, as in all other cases where the master-light is missing, so in this: the reflective mind avoids

---

[21] In one copy (H), Coleridge substitutes here "pre-conception" for "idea."

[22] Milton, *Paradise Lost* VII, 788. The original passage reads:

> . . . and other Suns perhaps
> With thir attendant Moons thou wilt descrie
> Communicating Male and Femal Light,
> Which two great Sexes animate the World,
> Stor'd in each Orb perhaps with some that live.

[23] Carolus Linnaeus (1707–1778), Swedish botanist, author of *Genera pantarum* (1737) that based the classification of plant species on observable sexual characteristics. Erasmus Darwin (1731–1802), the grandfather of Charles Darwin and Francis Galton, was instrumental in popularizing the Linnaean "sexual system" in England.

[24] Kaspar Bartholin or Berthelsen (1585–1629), Danish physician and theologian.

[25] For this important footnote, Coleridge draws upon Kant's *Metaphysical Foundations of a Science of Nature* (1786).

* The word Nature has been used in two senses, viz. actively and passively; energetic (= forma formans), and material (= forma formata). In the first (the sense in which the word is used in the text) it signifies the inward principle of whatever is requisite for the reality of a thing, as *existent:* while the *essence*, or essential property, signifies the inner principle of all that appertains to the *possibility* of a thing. Hence, in accurate language, we say the *essence* of a mathematical circle or other geometrical figure, not the *nature:* because in the conception of forms purely geometrical there is no expression or implication of their real existence. In the second, or material sense, of the word Nature, we mean by it the sum total of all things, as far as they are objects of our senses, and consequently of possible experience—the aggregate of phænomena, whether existing for our outward senses, or for our inner sense. The doctrine concerning material nature would therefore (the word Physiology being both ambiguous in itself, and already otherwise appropriated) be more properly entitled Phænomenology, distinguished into its two grand divisions, Somatology and Psychology. The doctrine concerning energetic nature is comprised in the science of DYNAMICS: the union of which with Phænomenology, and the alliance of both with the sciences of the Possible, or of the Conceivable, viz. Logic and Mathematics, constitute NATURAL PHILOSOPHY.

Having thus explained the term Nature, we now more especially entreat the reader's attention to the sense, in which here, and every where through this Essay, we use the word IDEA. We assert, that the very impulse to universalize any phænomenon involves the prior assumption of some efficient law in nature, which in a thousand different forms is evermore one and the same; entire in each, yet comprehending all; and incapable of being abstracted or generalized from any number of phænomena, because it is itself presupposed in each and all as their common ground and condition: and because every definition of a genus is the adequate definition of the lowest species alone, while the efficient law must contain the ground of all in all. It is *attributed*, never *derived*. The utmost we ever venture to say is, that the falling of an apple *suggested* the law of gravitation to Sir I. Newton. Now a law and an idea are correlative terms, and differ only as object and subject, as being and truth.

Such is the doctrine of the Novum Organum of Lord Bacon, agreeing (as we shall more largely show in the text)[26] in all essential points with the true doctrine of Plato, the apparent differences being for the greater part occasioned by the Grecian sage having applied his principles chiefly to the investigation of the mind, and the method of evolving its powers, and the English philosopher to the development of nature. That our great countryman speaks too often detractingly of the divine philosopher must be explained, partly by the tone given to thinking minds by the Reformation, the founders and fathers of which saw in the Aristotelians, or schoolmen, the antagonists of Protestantism, and in the Italian Platonists the despisers and secret enemies of Christianity itself; and partly, by his having formed his notions of Plato's doctrines from the absurdities and phantasms of his misinterpreters, rather than from an unprejudiced study of the original works.

Scylla only to lose itself on Charybdis.[27] If we adhere to the general notion of sex, as abstracted from the more obvious modes and forms in which the sexual relation manifests itself, we soon meet with whole classes of plants to which it is found inapplicable. If arbitrarily, we give it indefinite extension, it is dissipated into the barren truism, that all specific products suppose specific *means* of production. Thus a growth and a birth are distinguished by the mere verbal definition, that the latter is a whole in itself, the former not: and when we would apply even this to nature, we are baffled by objects (the flower polypus, &c. &c.) in which each is the other. All that can be done by the most patient and active industry, by the widest and most continuous researches; all that the amplest survey of the vegetable realm, brought under immediate contemplation by the most stupendous collections of species and varieties, can suggest; all that minutest dissection and exactest chemical analysis, can unfold; all that varied experiment and the position of plants and of their component parts in every conceivable relation to light, heat, (and whatever else we distinguish as imponderable substances) to earth, air, water, to the supposed constituents of air and water, separate and in all proportions—in short all that chemical agents and re-agents can disclose or adduce;—all these have been brought, as conscripts, into the field, with the completest accoutrement, in the best discipline, under the ablest commanders. Yet after all that was affected by Linnæus himself, not to mention the labours of Cæsalpinus, Ray, Gesner, Tournefort, and the other heroes who preceded the general adoption of the sexual system, as the basis of artificial arrangement—after all the successive toils and enterprizes of HEDWIG, JUSSIEU, MIRBEL, SMITH, KNIGHT, ELLIS,[28] &c. &c.—what is BOTANY at this present hour? Little more than an enormous nomenclature; a huge catalogue, *bien arrange*,[29] yearly and monthly augmented, in various editions, each with its own scheme of technical memory and its own conveniences of reference! . . . The terms system, method, science, are mere improprieties of courtesy, when applied to a mass enlarging by endless appositions, but without a nerve that oscillates, or a pulse that throbs, in sign of *growth* or inward sympathy. . . .

So long back as the first appearance of Dr. Darwin's Phytonomia,[30] the writer, then in earliest manhood, presumed to hazard the opinion, that the physiological botanists were hunting in a false direction; and sought for analogy where they should have looked for antithesis. He saw, or thought he saw, that the harmony between the vegetable and animal world, was not a harmony of resemblance, but of contrast; and their relation to each other that of corresponding opposites. They seemed to him (whose mind had been formed by observation, unaided, but at the same time unenthralled, by partial experiment) as two streams from the same fountain indeed, but flowing the one due west, and the other direct east; and that consequently, the resemblance would be as the proximity, greatest in the first and rudimental products of vegetable and animal organization.[31] Whereas, according to the received notion, the highest and most perfect vegetable, and the lowest and rudest animal forms, ought to have seemed the links of the two systems, which is contrary to fact. Since that time, the same idea has dawned in the minds of philosophers capable of demonstrating its objective truth by induction of facts in an unbroken series of correspondences in nature. From these men, or from minds enkindled by their labours, we hope hereafter to receive it, or rather the yet higher idea to which it refers us, matured into *laws* of organic nature; and thence to have one other splendid proof, that with the knowledge of LAW alone dwell Power and Prophecy, decisive Experiment, and, lastly, a scientific method, that dissipating with its earliest rays the gnomes of hypothesis and the mists of theory may, within a single generation, open out on the philosophic Seer discoveries that had baffled the gigantic, but blind and guideless industry of ages.

Such, too, is the case with the assumed indecomponible substances of the LABORATORY. They are the symbols of elementary powers, and the exponents of a law, which, as the root of all these powers, the chemical philosopher, whatever his theory may be, is instinctively labouring to extract.[32] This

---

[26] In Essay VIII, not included here. The position expressed here of a deep affinity between Bacon and Plato, while it goes very much against the appearance in Bacon's text of severe criticism of the ancients, but especially Plato and Aristotle, is grounded on Coleridge's view that the methodical investigation of the mind is cognate with the methodical investigation of nature.

[27] Scylla and Charybdis are the two complementary hazards that Odysseus must escape in Homer's *Odyssey*. Scylla is usually depicted as a creature with 12 feet and 6 heads, devouring any creature in reach; while Charybdis drinks in and spews out the ocean water, as in a whirlpool.

[28] Andreas Caesalpinus (1519–1603), Italian botanist; John Ray (c. 1627–1705), English naturalist; Konrad von Gesner (1516–1704), Swiss zoologist; Joseph Pitton de Tournefort (1656–1708), French botanist; Johann Hedwig (1730–1799), German botanist; Antoine Laurent de Jussieu (1748–1836), French biologist; Charles François Brisseau de Mirbel (1776–1854), French botanist; Sir James Edward Smith (1759–1828), English botanist; Thomas Andrew Knight (1759–1838), English horticulturist; John Ellis (c. 1710–1776), English naturalist.

[29] "Well arranged."

[30] Coleridge evidently has in mind here Erasmus Darwin's *Zoonomia* (1794–1796), not his *Phytologia* (1800).

[31] Coleridge is here expressing one of his most characteristic ideas of the expression of polar opposites of one power. See his *Theory of Life* (1848), 71, and his use of the same idea in the discussion of electricity and magenetism in Essay VII (below, page 516).

[32] Coleridge is arguing against the finality of a strict atomism, treating evidently indivisible atoms as symbols or exponents of a dynamic law. Cf. Ralph Cudworth's (1617–1686) massive neoplatonic argument against ancient and modern atomism in his *True Intellectual System of the Universe* (1678), which Coleridge had read and commented on in his notebooks as early as 1795–1796. See *Notebooks* I, 200–05. The interest of Coleridge's argument is that he does not, as did Cudworth, reject atomism as leading inevitably to atheism, but transformed it to show the belief in atoms as ultimate is an error of method.

instinct, again, is itself but the form, in which the idea, the mental Correlative of the law, first announces its incipient germination in his own mind: and hence proceeds the striving after unity of principle through all the diversity of forms, with a feeling resembling that which accompanies our endeavors to recollect a forgotten name; when we seem at once to have and not to have it; which the memory feels but cannot find. Thus, as "the lunatic, the lover, and the poet,"[33] suggest each other to Shakspeare's Theseus, as soon as his thoughts present him the ONE FORM, of which they are but varieties; so water and flame, the diamond, the charcoal, and the mantling champagne, with its ebullient sparkles, are convoked and fraternized by the theory of the chemist. This is, in truth, the first charm of chemistry, and the secret of the almost universal interest excited by its discoveries. The serious complacency which is afforded by the sense of truth, utility, permanence, and progression, blends with and ennobles the exhilarating surprise and the pleasurable sting of curiosity, which accompany the propounding and the solving of an Enigma. It is the sense of a principle of connection given by the mind, and sanctioned by the correspondency of nature. Hence the strong hold which in all ages chemistry has had on the imagination. If in Shakspeare we find nature idealized into poetry, through the creative power of a profound yet observant meditation, so through the meditative observation of a Davy, a Woollaston, or a Hatchett,[34]

> By some connatural force,
> Powerful at greatest distance to unite
> With secret amity things of like kind,[35]

we find poetry, as it were, substantiated and realized in nature: yea, nature itself disclosed to us, GEMINAM *istam naturam, quæ fit et facit, et creat et creatur,*[36] as at once the poet and the poem!

from
Essay VII

From Shakspeare to Plato, from the philosophic poet to the poetic philosopher, the transition is easy, and the road is crowded with illustrations of our present subject. For of Plato's works, the larger and more valuable portion have all one common end, which comprehends and shines through the particular purpose of each several dialogue; and this is to establish the sources, to evolve the principles, and exemplify the art of Method. This is the clue, without which it would be difficult to exculpate the noblest productions of the divine philosopher from the charge of being tortuous and labyrinthine in their progress, and unsatisfactory in their ostensible results. The latter indeed appear not seldom to have been drawn for the purpose of starting a new problem, rather than that of solving the one proposed as the subject of the previous discussion. But with the clear insight that the purpose of the writer is not so much to establish any particular truth, as to remove the obstacles, the continuance of which is preclusive of all truth; the whole scheme assumes a different aspect, and justifies itself in all its dimensions. We see, that to open anew a well of springing water, not to cleanse the stagnant tank, or fill, bucket by bucket, the leaden cistern; that the Education of the intellect, by awakening the principle and *method* of self-development, was his proposed object, not any specific information that can be *conveyed into it* from without: not to assist in storing the passive mind with the various sorts of knowledge most in request, as if the human soul were a mere repository or banqueting-room, but to place it in such relations of circumstances as should gradually excite the germinal power that craves no knowledge but what it can take up into itself, what it can appropriate, and re-produce in fruits of its own. To shape, to dye, to paint over, and to mechanize the mind, he resigned, as their proper trade, to the sophists, against whom he waged open and unremitting war. For the ancients, as well as the moderns, had their machinery for the extemporaneous mintage of intellects, by means of which, *off-hand,* as it were, the scholar was enabled *to make a figure* on any and all subjects, on any and all occasions.

* * *

In fine, as improgressive arrangement is not Method, so neither is a mere mode or set fashion of doing a thing. Are further facts required? We appeal to the notorious fact that Zoology, soon after the commencement of the latter half of the last century, was falling abroad, weighed down and crushed, as it were, by the inordinate number and manifoldness of facts and phænomena apparently separate, without evincing the least promise of systematizing itself by any inward combination, any vital interdependence of its parts. John Hunter,[37] who appeared at times almost a stranger to the grand conception, which yet never ceased to work in him as his genius and governing spirit, rose at length in the horizon of physiology and comparative anatomy. In his printed works, the one directing thought seems evermore to flit before him, twice or thrice only to have been seized, and after a momentary detention to have been again let go: as if the words of the charm had been incomplete, and it had appeared at its own will only to mock its calling. At length, in the astonishing preparations for his museum, he constructed it for the scientific apprehension out of the unspoken alphabet of nature. Yet notwithstanding the imperfection in the annunciation of the idea, how exhilarating have been the results! We dare appeal to ABERNETHY,* to EVERARD HOME, to HATCHETT,[38] whose communication to Sir Everard on the egg and its analogies, in a recent paper of the latter (itself of high excellence) in the Philosophical Transactions, we point out as being, in the proper sense of the term, the development of a FACT in the history of physiology, and to which we refer as exhibiting a luminous instance of what we mean by the discovery of a *central phænomenon.* To these we appeal, whether whatever is grandest in the views of CUVIER be not either a reflection of this light or a continuation of its rays, well and wisely directed through fit media to its appropriate object.*

---

[33] *Midsummer Night's Dream* V, i, 7.

[34] Sir Humphrey Davy (1778–1829), distinguished British chemist at the Royal Institution (a friend of Coleridge's); William Hyde Wollaston (1766–1828), influential British physicist and metallurgist; Charles Hatchett (c. 1765–1847), British manufacturer and chemist, discoverer of Niobium (his term, Columbium).

[35] *Paradise Lost* IX, 246–8. Original reads "or some connatural force, . . ."

[36] The source is John Scotus Erigena, *De divisione naturae* 1.13 (1681). Coleridge modified the original, which reads *"gemina natura, quae fit et facit, et creat et creatur":* "the divine nature, which made and is making, both creates and is created."

[37] John Hunter (1728–1793), British surgeon and medical experimentalist; see also Coleridge's *Theory of Life* (1848), dedicated to Hunter.

We have seen that a previous act and conception of the mind is indispensible even to the mere semblances of Method: that neither fashion, mode, nor orderly arrangement can be produced without a prior purpose, and "a pre-cogitation *ad intentionem ejus quod quæritur;*"[39] though this purpose may have been itself excited, and this "pre-cogitation" itself abstracted from the perceived likenesses and differences of the objects to be arranged. But it has likewise been shown, that fashion, mode, ordonnance, are not Method, inasmuch as all Method supposes A PRINCIPLE OF UNITY WITH PROGRESSION; in other words, progressive transition without breach of continuity. But such a principle, it has been proved, can never in the sciences of experiment or in those of observation be adequately supplied by a theory built on generalization. For what shall determine the mind to abstract and generalize one common point rather than another? and within what limits, from what number of individual objects, shall the generalization be made? The theory must still require a prior theory for its own legitimate construction. With the mathematician the definition *makes* the object,[40] and pre-establishes the terms which, and which alone, can occur in the after-reasoning. . . .

A mathematical *theoria seu contemplatio*[41] may therefore be perfect. For the mathematician can be certain, that he has contemplated *all* that appertains to his proposition. The celebrated EULER,[42] treating on some point respecting arches, makes this curious remark, "All experience is in contradiction to this; sed potius fidendum est analysi; *i.e.* but this is no reason for doubting the analysis." The words *sound* paradoxical; but in truth mean no more than this, that the properties of *space* are not less certainly the properties of space because they can never be entirely transferred to material bodies. But in physics, that is, in all the sciences which have for their objects the things of nature, and not the *entia rationis*[43]—more philosophically, intellectual acts and the products of those acts, existing exclusively in and for the intellect itself—the definition must follow, and not precede the reasoning. It is representative not constitutive, and is indeed little more than an abbreviature of the preceding observation, and the deductions therefrom. But as the observation, though aided by experiment, is necessarily limited and imperfect, the definition must be equally so. The history of theories, and the frequency of their subversion by the discovery of a single new fact, supply the best illustrations of this truth.*

As little can a true scientific method be grounded on an hypothesis, unless where the hypothesis is an exponential image or picture-language of an *idea* which is contained in

---

*Since the first delivery of this sheet, Mr. Abernethy has realized this anticipation, dictated solely by the writer's wishes, and at that time justified only by his general admiration of Mr. A.'s talents and principles; but composed without the least knowledge that he was then actually engaged in proving the assertion here hazarded, at large and in detail. See his eminent "Physiological Lectures," lately published in one volume octavo.

[38] John Abernathy (1764–1831), a surgeon and student of John Hunter; Coleridge's note below refers to his *Physiological Lectures* (1817); Everard Home (1756–1832), another surgeon and student of Hunter; Charles Hatchett, see note 34 above.

*Nor should it be wholly unnoticed, that Cuvier, who, we understand, was not born in France, and is not of unmixed French extraction, had prepared himself for his illustrious labors (as we learn from a reference in the first chapter of his great work, and should have concluded from the general style of thinking, though the language betrays suppression, as of one who doubted the sympathy of his readers or audience) in a very different school of methodology and philosophy than Paris could have afforded.

[39] "To the investigation of the point at issue"; unknown source.

[40] Coleridge is elaborating a point from Vico (quoted from Jacobi), in *De antiquissima italorum sapientia* (1710); cf. Barbara Rooke, *The Friend* I, 476, n. 1.

[41] "Philosophical speculation or survey."

[42] Leonhart Euler (1707–1783), Swiss mathematician and physicist. The comment has not been located.

[43] "Entities of reason" or "intelligible realities."

*The following extract from a most respectable scientific Journal contains an exposition of the impossibility of a perfect *Theory* in Physics, the more striking because it is directly against the purpose and intention of the writer. We content ourselves with one question, What if Kepler, what if Newton in his investigations concerning the Tides, had held themselves bound to this canon, and instead of propounding a law, had employed themselves exclusively in collecting materials for a *Theory?*

"The magnetic influence has long been known to have a variation which is constantly changing; but that change is so slow, and at the same time so different in various *(different?)* parts of the world, that it would be in vain it more or less clearly; or the symbol of an undiscovered law, like the characters of unknown quantities in algebra, for the purpose of submitting the phænomena to a scientific calculus. In all other instances, it is itself a real or supposed phænomenon, and therefore a part of the problem which it is to solve. It may be among the foundation-stones of the edifice, but can never be the *ground.*

But in experimental philosophy, it may be said how much do we not owe to accident? Doubtless: but let it not be forgotten, that if the discoveries so made stop there; if they do not excite some master IDEA; if they do not lead to some LAW (in whatever dress of theory or hypotheses the fashions and prejudices of the time may disguise or disfigure it): the discoveries may remain for ages limited in their uses, insecure and unproductive. How many centuries, we might have said millennia, have passed, since the first accidental discovery of the attraction and repulsion of light bodies by rubbed amber, &c. Compare the interval with the progress made within less than a century, after the discovery of the phænomena that led immediately to a THEORY of electricity. That here as in many other instances, the theory was supported by insecure hypotheses; that by one theorist two heterogeneous fluids are assumed, the vitreous and the resinous; by another, a plus and minus of the same fluid; that a third considers it a mere modification of light; while a fourth composes the electrical aura of oxygen, hydrogen, and caloric: this does but place the truth we have been evolving in a stronger and clearer light. For abstract from all these suppositions, or rather imaginations, that which is common to, and involved in them all; and we shall have neither notional fluid or fluids, nor chemical compounds, nor elementary matter,—but the idea of *two—opposite—forces,* tending to rest by equilibrium. These are the sole factors of the calculus, alike in all the theories. These give the *law,* and in it the *method,* both of arranging the phænomena and of substantiating appearances into facts of science; with a success proportionate to the clearness or confusedness of the insight into the law. For this reason, we anticipate the greatest improvements in the *method,* the nearest approaches to a *system* of electricity from these philosophers, who have presented the law most purely, and the correlative idea as an idea: those, namely, who, since the year 1798,[46] in the true spirit of experimental dynamics, rejecting the imagination of any material substrate, simple or compound, contemplate in the phænomena of electricity the operation of a law which reigns through all nature, the law of POLARITY, or the manifestation of one power by opposite forces: who trace in these appearances, as the most obvious and striking of its innumerable forms, the agency of the positive and negative poles of a power essential to all material construction; the second, namely, of the three primary principles, for which the beautiful and most appropriate symbols are given by the mind in the three ideal dimensions of space.

The time is, perhaps, nigh at hand, when the same comparison between the results of two unequal periods; the interval between the knowledge of a fact, and that from the discovery of the law, will be applicable to the sister science of magnetism. But how great the contrast between magnetism and electricity, at the present moment! From remotest antiquity, the attraction of iron by the magnet was known and noticed; but, century after century, it remained the undisturbed property of poets and orators. The fact of the magnet and the fable of the phœnix stood on the same scale of utility. In the thirteenth century, or perhaps earlier, the polarity of the magnet, and its communicability to iron, were discovered; and soon suggested a purpose so grand and important, that it may well be deemed the proudest trophy ever raised by accident*

---

to seek for the means of reducing it to established rules, until all its local and particular circumstances are clearly ascertained and recorded by accurate observations made in various parts of the globe. The necessity and importance of such observations are now pretty generally understood, and they have been actually carrying on for some years past; but these *(and by parity of reason the incomparably greater number that remain to be made)* must be collected, collated, proved, and afterwards brought together into one focus before ever a foundation can be formed upon which any thing like a sound and stable *Theory* can be constituted for the explanation of such changes." *Journal of Science and the Arts,* No. vii. p. 103.[44]

An intelligent friend, on reading the words "into one focus," observed: But what and where is the *lens?* I however fully agree with the writer. All this and much more must have been atchieved before "a sound and stable Theory" could be "constituted"—which even then (except as far as it might occasion the discovery of a law) might possibly *explain* (*ex* plicis *plana* reddere),[45] but never *account for,* the facts in question. But the most satisfactory comment on these and similar assertions would be afforded by a *matter of fact* history of the rise and progress, the accelerating and retarding momenta, of science in the civilized world.

[44] The article cited is a review of William Bain's *An Essay on the Variations of the Compass* (1817).

[45] The expression is ambiguous, meaning either "to make plain the obscure" (reading "*ex* plicis" as *explicatis*) or "to make plain the obvious" (reading it as *explicitis*).

[46] Coleridge is evidently referring to the work of Alessandro Volta (1745–1827) that led to the development of the electrical battery, from 1794 to 1800. Crucial for Coleridge's conjecture here is the confirmation provided in 1831 by the discovery of Michael Faraday (1791–1867) that a magnet, moved through a coil of wire, produced an electrical current, leading later to the expansion of electromagnetic theory by James Clerk Maxwell (1831–1879) to include light. It is of special interest that Maxwell, as an undergraduate at Cambridge, wrote several essays while a member of the "Apostle's Club" (a group with historical links to Coleridge) on the subject of scientific method with intriguing similarities to Coleridge's argument here. See Lewis Campbell and William Garnett, *The Life of James Clerk Maxwell* (1882).

*If accident it were: if the compass did not obscurely travel to us from the remotest east: if its existence there does not point to an age and a race, to which scholars of highest rank in the world of letters, Sir W. Jones, Bailly, Schlegel[47] have attached faith! That it was known before the æra generally assumed for its invention, and not spoken of as a novelty, has been proved by Mr. Southey and others.[48]

in the service of mankind—the invention of the compass. But it led to no idea, to no law, and consequently to no Method: though a variety of phænomena, as startling as they are mysterious, have forced on us a presentiment of its intimate connection with all the great agencies of nature; of a revelation, in ciphers, the key to which is still wanting. We can recall no incident of human history that impresses the imagination more deeply than the moment when Columbus,* on an unknown ocean, first perceived one of these startling facts, the change of the magnetic needle!

In what shall we seek the cause of this contrast between the rapid progress of electricity and the stationary condition of magnetism? As many theories, as many hypotheses, have been advanced in the latter science as in the former. But the theories and fictions of the electricians contained an *idea*, and all the same idea, which has necessarily led to METHOD; implicit indeed, and only regulative hitherto, but which requires little more than the dismission of the imagery to become constitutive like the ideas of the geometrician. On the contrary, the assumptions of the magnetists (as for instance, the hypothesis that the planet itself is one vast magnet, or that an immense magnet is concealed within it; or that of a concentric globe within the earth, revolving on its own independent axis) are but repetitions of the same fact or phænomenon looked at through a magnifying glass; the *reiteration* of the problem, not its solution. The naturalist, who cannot or will not see, that one fact is often worth a thousand, as including them all in itself, and that it first *makes* all the others *facts;* who has not the head to comprehend, the soul to reverence, a *central* experiment or observation[49] (what the Greeks would perhaps have called a *protophænomon*); will never receive an auspicious answer from the oracle of nature.

---

[47] All writers on the ancient Orient: Sir William Jones (1746–1794); Jean Sylvain Bailly (1736–1793); and K. W. F. von Schlegel (1772–1829).

[48] Robert Southey, *Omniana* I, 210, quotes a passage from Alfonso X the Wise from the thirteenth century, mentioning the mariner's needle.

*It cannot be deemed alien from the purposes of this disquisition, if we are anxious to attract the attention of our readers to the importance of speculative meditation, even for the *wordly* interests of mankind; and to that concurrence of nature and historic event with the great revolutionary movements of individual genius, of which so many instances occur in the study of History—how nature (why should we hesitate in saying, that which in nature itself is more than nature?) seems to come forward in order to meet, to aid, and to reward every idea excited by a contemplation of her methods in the spirit of filial care, and with the humility of love!

[49] See in this context Thomas Kuhn's account of "scientific paradigms" as exemplary scientific achievements that order and propel the problem-solving activity of "normal science" in "Postscript–1969" (below, page 1282).

The Statesman's Manual

. . . It is among the miseries of the present age that it recognizes no medium between *Literal* and *Metaphorical.* Faith is either to be buried in the dead letter, or its name and honors usurped by a counterfeit product of the mechanical understanding, which in the blindness of self-complacency confounds SYMBOLS with ALLEGORIES. Now an Allegory is but a translation of abstract notions into a picture-language which is itself nothing but an abstraction from objects of the senses; the principal being more worthless even than its phantom proxy, both alike unsubstantial, and the former shapeless to boot. On the other hand a Symbol (ὃ ἔστιν ἄει ταυτηγόρικον)[1] is characterized by a translucence of the Special in the Individual or of the General in the Especial or of the Universal in the General. Above all by the translucence of the Eternal through and in the Temporal. It always partakes of the Reality which it renders intelligible; and while it enunciates the whole, abides itself as a living part in that Unity, of which it is the representative.

The Statesman's Manual first appeared in 1816. Reprinted from R. J. White, ed., *Lay Sermons* (1972), page 31.

[1] "Which is always tautegorical." The OED credits Coleridge with coining "tautegorical" (a term highly praised by Schelling and Benjamin Jowett), citing *Aids to Reflection* (1825): "The base of Symbols and symbolical expressions; the nature of which is always *tautegorical* (that is, expressing the same subject but with a difference) in contradistinction from metaphors and similitudes, that are always *alle*gorical (that is, expressing a different subject but with a resemblance)."

from

On the Constitution of Church and State

. . . By an *idea,* I mean, (in this instance) that conception of a thing, which is not abstracted from any particular state, form, or mode, in which the thing may happen to exist at this or at that time; nor yet generalized from any number or succession of such forms or modes; but which is given by the knowledge of *its ultimate aim.*[1]

On the Constitution of Church and State was first published in 1829. Reprinted here from *On the Constitution of Church and State,* edited by John Colmer (Princeton: Princeton University Press, 1976).

[1] In the paragraphs preceding this sentence, Coleridge's focus has been specifically upon the Idea of a constitution and its relation to a National Church and its difference from the "Church of Christ." The discussion to follow, however, pertains to a much broader range of issues.

Only one observation I must be allowed to add, that this knowledge, or sense, may very well exist, aye, and powerfully influence a man's thoughts and actions, without his being distinctly conscious of the same, much more without his being competent to express it in definite words. This, indeed, is one of the points which distinguish *ideas* from *conceptions,* both terms being used in their strict and proper significations. The latter, *i.e.* a conception, *consists* in a conscious act of the understanding, bringing any given object or impression into the same class with any number of other objects, or impressions, by means of some character or characters common to them all. *Concipimus,* id est, capimus hoc *cum* illo,[2]—we take hold of both at once, we *comprehend* a thing, when we have learnt to comprise it in a known *class.* On the other hand, it is the privilege of the few to possess an idea: of the generality of men, it might be more truly affirmed, that they are possessed by it.

What is here said, will, I hope, suffice as a popular explanation. For some of my readers, however, the following definition may not, perhaps, be useless or unacceptable. That which, contemplated *objectively* (*i.e.* as existing *externally* to the mind), we call a LAW; the same contemplated *subjectively* (*i.e.* as existing in a subject or mind), is an idea. Hence Plato often names ideas laws; and Lord Bacon, the British Plato, describes the Laws of the material universe as the Ideas in nature. Quod in naturâ *naturatâ* LEX, in naturâ *naturante* IDEA dicitur.[3] By way of illustration take the following. Every reader of Rousseau, or of Hume's Essays, will understand me when I refer to the Original Social Contract, assumed by Rousseau, and by other and wiser men before him, as the basis of all legitimate government.[4] Now, if this be taken as the assertion of an historical fact, or as the application of a conception, generalized from ordinary compacts between man and man, or nation and nation, to an actual occurrence in the first ages of the world; namely, the formation of the first contract, in which men covenanted with each other to associate, or in which a multitude entered into a compact with a few, the one to be governed and the other to govern, under certain declared conditions; I shall run little hazard at this time of day, in declaring the pretended fact a pure fiction, and the conception of such a fact an idle fancy. It is at once false and foolish.* For what if an original contract had actually been entered into, and formally recorded? Still I cannot see what addition of moral force would be gained by the fact. The same sense of moral obligation which binds us to keep it, must have pre-existed in the same force and in relation to the same duties, impelling our ancestors to make it. For what could it do more than bind the contracting parties to act for the general good, according to their best lights and opportunities? It is evident, that no specific scheme or constitution can derive any other claim to our reverence, than that which the presumption of its necessity or fitness for the general good shall give it; and which claim of course ceases, or rather is reversed, as soon as this general presumption of its utility has given place to as general a conviction of the contrary. It is true, indeed, that from duties anterior to the formation of the contract; because they arise out of the very constitution of our humanity, which supposes the social state—it is true, that in order to a rightful removal of the institution, or law, thus agreed on, it is required that the conviction of its inexpediency shall be as general, as the presumption of its fitness was at the time of its establishment. This, the first of the two great paramount interests of the social state demands, namely, that of permanence; but to attribute more than this to any fundamental articles, passed into law by any assemblage of individuals, is an injustice to their successors, and a high offence against the other great interest of the social state, namely,—its progressive improvement. The conception, therefore, of an original contract, is, we repeat, incapable of historic proof as a fact, and it is senseless as a theory.

But if instead of the *conception* or *theory* of an original social contract, you say the *idea* of an ever-originating social contract, this is so certain and so indispensable, that it constitutes the whole ground of the difference between subject and serf, between a commonwealth and a slave-plantation. And this, again, is evolved out of the yet higher idea of *person,* in contra-distinction from *thing*—all social law and justice being grounded on the principle, that a person can never, but by his own fault, become a thing, or, without grievous wrong, be treated as such: and the distinction consisting in this, that a thing may be used altogether and merely as the *means* to an end; but the person must always be included in the *end:* his interest must form a part of the object, a *means* to which, he, by consent, *i.e.* by his own act, makes himself. We plant a tree, and we fell it; we breed the sheep, and we shear or we kill it; in both cases wholly as means to *our* ends. For trees and animals are *things.* The wood-cutter and the hind are likewise employed as *means,* but on agreement, and that too an agreement of reciprocal advantage, which includes them as well as their employer in the *end.* For they are *persons.*[6] And the government, under which the contrary takes place, is not worthy to be called a STATE, if, as in the kingdom of Dahomy,[7] it be unprogressive; or only by anticipation, where, as in Russia, it is in advance to a better and more *man-worthy* order of things. Now, notwithstanding the late wonderful spread of learning through the community, and though the schoolmaster and the lecturer are abroad, the hind and the woodman may, very conceivably, pass from cradle to coffin, without having once contemplated this idea, so as to be conscious of the same. And there would be even an improbability in the supposition that they possessed the power of presenting this Idea to the minds of others, or even to their own thoughts, verbally as a distinct proposition. But no man, who has ever listened to laborers of this rank, in any alehouse, over the Saturday night's jug of beer, discussing the injustice of the present rate of wages, and the iniquity of their being paid in part out of the parish poor-rates,[8] will doubt for a moment that they are fully possessed by the idea.

---

[2] "We *conceive,* that is, we take this *with* that."

[3] "What is called LAW in *created* nature is called IDEA in *creative* nature." Cf. "Essays on the Principles of Method" (above, page 508) and *The Friend* I, 491–2.

[4] Cf. especially *The Social Contract* (1762) by Jean Jacques Rousseau (1712–1778). Coleridge does not mention here the other two principal theorists of the social contract, Thomas Hobbes (1588–1679) and John Locke (1632–1704), both influences on David Hume (1711–1776). Cf. Hume's *A Concise and Genuine Account of the Dispute Between Mr. Hume and Mr. Rousseau* (1766).

* I am not indeed certain, that some operatical farce, under the name of a Social Contract or Compact, might not have been acted by the Illuminati and Constitution-manufacturers, at the close of the eighteenth century,[5] a period which how far it deserved the name, so complacently affixed to it by the contemporaries of "this *enlightened* age," may be doubted. That it was an age of *Enlighteners,* no man will deny.

[5] Coleridge is evidently referring to Adam Weishaupt (1748–1830), founder of the Order of the Illuminated; and Joseph Emmanuel Sieyès (1748–1836). See John Colmer, ed., *Church and State,* 14 n. 2 for additional information.

In close, though not perhaps obvious connection, with this, is the idea of moral freedom, as the ground of our proper responsibility. Speak to a young Liberal, fresh from Edinburgh or Hackney or the Hospitals, of Free-will, as implied in Free-agency, he will perhaps confess to you with a smile, that he is a Necessitarian,—[9]proceed to assure you that the liberty of the will is an impossible conception, *a contradiction in terms,** and finish by recommending you to read Jonathan Edwards, or Dr. Crombie, or as it may happen, he may declare the will itself a mere delusion, a non-entity, and ask you if you have read Mr. Lawrence's Lecture.[10] Converse on the same subject with a plain, single-minded, yet reflecting neighbour, and he may probably say (as St. Augustin had said long before him, in reply to the question, What is Time?) I know it well enough when you do not ask me.[12] But alike with both the supposed parties, the self-complacent student, just as certainly as with your less positive neighbour—attend to their actions, their feelings, and even to their words: and you will be in ill luck, if ten minutes pass without affording you full and satisfactory proof, that the *idea* of man's moral freedom possesses and modifies their whole practical being, in all they say, in all they feel, in all they do and are done to: even as the spirit of life, which is contained in no vessel, because it permeates all.

Just so is it with the *constitution. Ask any of our politicians what is meant by the constitution, and it is ten to one that he will give you a false explanation, *ex. gr:* that it is the body of our laws, or that it is the Bill of Rights; or perhaps, if he have read Tom Payne,[13] he may tell you, that we have not yet got one; and yet not an hour may have elapsed, since you heard the same individual denouncing, and possibly with good reason, this or that code of laws, the excise and revenue laws, or those for including pheasants, or those for excluding Catholics, as altogether unconstitutional: and such and such acts of parliament as gross outrages on the constitution. Mr. Peel, who is rather remarkable for groundless and unlucky concessions, owned that the present Bill[14] breaks in on the constitution of 1688: and, A.D. 1689, a very imposing minority of the then House of Lords, with a decisive majority in the Lower House of Convocation, denounced the constitution of 1688, as breaking in on the English Constitution.

---

[6] Cf. *The Friend* I, 189–90; and Kant, *The Foundation of the Metaphysics of Morals,* tr., Lewis White Beck (Library of Liberal Arts, 1959), 46: "Now, I say, man and, in general, every rational being exists as an end in himself and not merely as a means to be arbitrarily used by this or that will."

[7] For Coleridge and his contemporaries, the case of Dahomey, notorious both for its role in the slave trade and for the practice of human sacrifice, was a topic of great interest and concern. Cf. Archibald Dalzel's *History of Dahomey* (1793), and Raimonda Modiano, "Unremembered Sights of Violence: The Scandal of Dahomey's Rites of Human Sacrifice in the Abolition of the Slave Trade in England" in *The Poetics of Memory,* edited by Thomas Wägenbaur (1998).

[8] Coleridge is referring to the decision of local magistrates at Speenhamland, Berkshire, to institute a system of supplements for poor workers, subsequently adopted over much of England. The Speenhamland system was attacked from both sides for its effects in making the poor dependent on the parish, just as it encouraged employers to lower wages and to raise rents. See especially Karl Polanyi's *The Great Transformation* (1944), which provides an incisive critique of the effects of Speenhamland on the creation of a wage system and the development of capitalism.

[9] A doctrine of determinism that denies the freedom of the will. Coleridge was himself influenced in this way by the associationism of David Hartley (1705–1757).

* See AIDS TO REFLECTION, p. 226; where this is shewn to be one of the distinguishing characters of *ideas,* and marks at once the difference between an *idea* (a *truth-power* of the reason) and a conception of the understanding; viz. that the former, as expressed in words, is always, and necessarily, a *contradiction in terms.*[11]

[10] Jonathan Edwards (1703–1758), American divine and philosopher, briefly president of Princeton University, author of *A Careful and Strict Enquiry into that Freedom of the Will . . .* (1754); Alexander Crombie (1762–1840), *An Essay on Philosophic Necessity* (1793); William Lawrence (1783–1867), British surgeon who attacked the vitalist theories of John Hunter in *On the Physiology, Zoology, and Natural History of Man* (1819).

[11] The precise language in *Aids to Reflection* (1825) differs: a truth affirmed by Reason "can come forth out of the moulds of the Understanding only in the disguise of two contradictory conceptions, each of which is partially true, and the conjunction of both conceptions becomes the representative or *expression* (the *exponent*) of a truth *beyond* conception and inexpressible."

[12] Paraphrased from St. Augustine (354–430), *Confessions* 11.14.

*I do not say, with the idea: for the constitution itself is an IDEA. This will sound like a paradox or a sneer to those with whom an Idea is but another word for a *fancy,* a something unreal; but not to those who in the ideas contemplate the most real of all realities, and of all operative powers the most *actual.*

[13] I.e., Thomas Paine (1737–1809), author of revolutionary pamphlets and tracts, including *Common Sense* (1776), the *Crisis* papers (1776–1783), and *Rights of Man* (1791).

But a Constitution is an idea arising out of the idea of a state; and because our whole history from Alfred onward demonstrates the continued influence of such an idea, or ultimate aim, on the minds of our fore-fathers, in their characters and functions as public men; alike in what they resisted and in what they claimed; in the institutions and forms of polity which they established, and with regard to those, against which they more or less successfully contended; and because the result has been a progressive, though not always a direct, or equable advance in the gradual realization of the idea; and that it is actually, though even because it is an *idea* it cannot be *adequately*, represented in a correspondent scheme of means really existing; we speak, and have a right to speak, of the idea itself, as actually existing, *i.e.*, as a *principle*, existing in the only way in which a principle can exist—in the minds and consciences of the persons, whose duties it prescribes, and whose rights it determines. In the same sense that the sciences of arithmetic and of geometry, that mind, that life itself, have reality; the constitution has real existence, and does not the less exist in reality, because it both *is*, and *exists as*, an IDEA.

---

[14] No small part of the impetus to publish *On the Constitution of Church and State* was the raging controvery over the Catholic Emancipation Bill (enacted in 1829), effectively reversing restrictions and exclusion of Catholics, dating from the 1680s. See G. I. T. Machin, *The Catholic Question in English Politics, 1820–1830* (1964).

Wilhelm von Humboldt

1767–1835

A Prussian career diplomat and minister of state for thirty-four years (though out of favor for part of that time and eventually summarily dismissed for advanced opinions), von Humboldt was a voluminus writer on many subjects, his collected works amounting to seventeen volumes. He wrote on language in general, certain languages in particular, literature, aesthetics, psychology, and women. He translated the *Agamemnon* of Aeschylus. He was also the author of 1,183 sonnets and a number of narrative poems, all best forgotten. It is in those writings where he extends the Kantian notion of human constitutive powers into the domain of language that he comes down to us as a major thinker, spanning the shift from epistemological to linguistic concerns.

Few of his writings were published in his lifetime. His more famous brother Alexander (1769–1859), an explorer much interested in languages, brought back to Wilhelm information about languages he had come to know about. Wilhelm employed Alexander's information both in his detailed study of the Kavi language of Java, *Kawiwerk,* posthumously published in three volumes, and in his more philosophically oriented studies in linguistics. He wrote on Chinese, Basque, and Mexican, on differences in human linguistic structures, on various periods of linguistic development, and on national linguistic characteristics. For von Humboldt, man is man only through language; language is his defining attribute: "Just as no concept is possible without language, so no object is possible without it for the psyche, since even external ones receive their intrinsic substance only through language." He belongs in a line of thinkers about language from Vico (above, page 313) to Cassirer (below, page 1016), who was clearly influenced by him.

The selections that follow come from a variety of his works. Numbers following each selection refer to volume and page of the *Gesammelte Schriften.*

In addition to *Humanist Without Portfolio* (1963), an anthology of von Humboldt's writings with an interesting introduction by Marian Cowan, his *Linguistic Variability and Intellectual Development* is available in English translation by G. C. Buck and F. A. Raven, as well as *On Language: The Diversity of Human Structure and Its Influence on the Mental Development of Mankind,* translated by Peter Heath. *Gesammelte Schriften* in seventeen volumes was published from 1903 to 1935. See Roger Langham Brown, *Wilhelm von Humboldt's Conception of Linguistic Relativity* (1967); Kurt Muller-Vollmmer, *Poesie und Einbildungskraft* (1967); Richey A. Novak, *Wilhelm von Humboldt as a Literary Critic* (1972); Martin L. Manchester, *The Philosophical Foundations of Humboldt's Linguistic Doctrines* (1985).

Collected Works

from

The Eighteenth Century (1796–1797)

All words designating moral qualities can accord only to a certain degree, never wholly, with the things which they designate. Like all words, in fact, they express only concepts, with their relatively firm and definite boundaries, since the things for which the words stand, due to the indissoluble interrelationship of all parts of the moral universe, flow over one into the other without any boundaries that can be noted. Language helps us out of this embarrassment by subjecting the usage of a word to the dicta of practiced feeling, rather than bothering about exact logical definition. Therefore all such words operate in a double sphere: a logical one, bordered by the defined concept which they designate, and a practical one, determined by custom and usage. The true difference between these two spheres ought to rest on the difference which always exists between the concept of an object produced by reason and the image of it formed by sensation and feeling. These, since we sense and feel more, and more subtly than we think, never coincide. The factual difference, however, in most languages rests much more on accident and prejudice. One need only compare the extent of actual usage with the extent of the best and subtlest definitions of such words as "wit," for example, or "delicacy" or "rapture," to convince oneself that one is frequently much greater and just as frequently much smaller than the other.

That is why the beginner in any language expresses himself so unidiomatically without actually making mistakes; that is why the number of synonyms always decreases with the degree of linguistic development; and that is why the linguist always recognizes more of the latter than does the finest, most cultivated author. Now if a word is newly formed, or its meaning freshly defined, then it occupies at first only the logical sphere which coincides with the concept for which it was meant. It therefore presents itself only to our understanding, leaving our imagination and our feelings untouched. . . . This is why neologisms, made in great numbers and intentionally, are advisable only in the completely speculative or technical sciences where only pure rational concepts are dealt with, not real things, or where it suffices to differentiate things by certain singled-out characteristics alone. But in the field of practical philosophy, where everything depends on not merely thinking the moral objects given in experience but on representing them in their total natural endowment, one must avail oneself of the help of neologisms much more sparingly and cautiously. Else one runs the danger of taking all the spirit and all the fruitfulness out of one's line of reasoning. [II, 73–75]

from

Essay on Aesthetics (1797–1798)

The realm of imagination is directly opposed to the realm of reality, and equally opposed is the character of whatever belongs to one of these realms to anything within the other. Part and parcel of the concept of reality is the segregation of each individual phenomenon; none stands in causal relationship to any other. . . . As soon as one walks over to the realm of possibilities, on the other hand, nothing exists except in a state of dependency upon everything else. Everything, in fact, which cannot be thought of as other than in a condition of inner interaction *is ideal* in the simplest and strictest sense of the word. For it is wholly opposed to reality. [II, 128]

However incomprehensible the art process, however certainly there is something which the artist himself does not understand and the critic can never utter, this much is known: the artist begins by transforming something real into an image. But he soon finds out that this cannot be done except by a sort of living communication, by somehow letting an electric spark of his imagination leap over to the imagination of others, and this not directly but through the mediation of an object into which he breathes his own living soul.

This is the only way open to the artist. And without in any way wanting it, but just by fulfilling his calling and leaving the execution of his task to his imagination, he lifts nature over the boundaries of reality and leads her into the land of ideas, recreating her individuals as ideals. [II, 132]

The concept of ideality, as being something which lies above reality, is reminiscent of the rule that art is imitation of nature, a rule which for a long time we have commanded the artist to follow. It has even been considered a good definition of art itself. It does contain the two main concepts of art, namely reality (here called nature) and imitation (that which does not permit a total identity with its model). But it contains a vagueness or looseness which can be avoided only by the realization (hitherto not often felt) that the essence of art does not lie in the nature of its objects but in the mood of the imagination. . . . Since the artist makes nature (by which we mean everything that can have reality for

---

These selections from the *Gesammelte Schriften* of von Humboldt are reprinted from Marian Cowan, ed. and tr., *Humanist Without Portfolio: An Anthology of the Writings of Wilhelm von Humboldt* (Detroit: Wayne State University Press, 1963).

us) into an object of the imagination, we may call art *the objectification of nature by the imagination.* [II, 132 f.][1]

If we survey the path that a poet (and every artist) takes, we are overwhelmed by the realization with what a simple aim he starts and what incomprehensible heights he reaches as he executes that aim.

He starts by turning a real object, almost playfully, into an imaginative one, and ends with the greatest and most difficult task which gives to human beings their ultimate meaning: to relate himself intimately to the whole external world and this to him; to accept the world at first like a foreign object but then, in his own fashion and with the organs at his individual disposal, to return it to itself, free and organized.

For all the materials of his observation are organized by him into an ideal form for the imagination. The world around him appears to him like a completely individual, living, harmonious, nowhere restricted or dependent, self-sufficient totality of manifold forms. Thus has he transferred his own inmost and best nature to it, turning it into a creation with which he can then completely sympathize. [II, 142]

from
Catium and Hellas (1806)

The least advantageous influence on any sort of interesting treatment of linguistic studies is exerted by the narrow notion that language originated as a convention and that words are nothing but signs for things or concepts which are independent of them.[2] This view up to a point is certainly correct but beyond this point it is deadly because as soon as it begins to predominate it kills all mental activity and exiles all life. To it we owe the constantly reiterated commonplaces that linguistic study is necessary only for external purposes or for the discipline of as yet unpracticed mentalities; that the best method for learning a language is the one that leads most quickly to the mechanical, automatic understanding and use of it; that any language, if one only knows it well, is about as useful as any other; that it would be best if all nations could agree on the use of a single one—and whatever other prejudices of this sort there are.

A more careful examination demonstrates precisely the opposite of all these notions.

Naturally, a word is a sign insofar as it is used to stand for a thing or a concept, but in its particular past development and its particular effectiveness it is a particular and independent creature—an individual. The sum of all words—language—is a universe which lies midway between the external, phenomenal one and our own inwardly active one. Naturally it is based upon convention, insofar as all the members of a linguistic group understand one another, but the individual words were first formed out of the natural feeling of the speaker and understood by the similar natural feeling of the hearer. Hence, linguistic study teaches, in addition to the use of a particular language, the analogical relation between man and the world in general, and each individual nation in particular, which is expressed by language. And since the spirit which constantly reveals itself in the world can never be exhaustively known through any given number of views or opinions, but is always discovered to contain something new, it would be far better to multiply the languages on earth as many times as the number of earth's inhabitants might permit. [III, 167 f.]

As little as a word is an image of the thing which it designates, so little is it a mere intimation that this thing is supposed to be thought by reason or represented in imagination. It is differentiated from an image by the possibility inherent in it and in us to imagine the thing according to the most various points of view and in the most various ways; it is different from a mere intimation in that it has its own definite, sensuous form. If you utter the word *Wolke* (cloud) you neither think of its definition nor do you see a single definite image of the natural phenomenon. All its different concepts and images, all the sensations and feelings which have been joined to its perception, everything—finally—which is related in some fashion to it, within us or without us: all these may represent themselves to the mind simultaneously and yet run no danger of confusion because the single sound of the word fastens and secures them. But the sound does even more: it brings back sometimes this, sometimes that association and if, as in the case of *Wolke,* the associative material is rich in itself (*Woge* billow, *Welle* wave, *wälzen* rolling, *Wind* wind, *wehen* blowing, *Wald* woods, etc.) then the sound of the word attunes the soul in a manner befitting the object, partly through itself, partly through recollection and associative analogies. Thus a word reveals itself as an individual with a nature of its own which bears resemblance to an object of art in that, with a sensuous form borrowed from nature, it makes possible an idea which is beyond all nature. Here however the resemblance stops, since the differences leap to the eye. For this idea which lies beyond all nature is precisely that which alone renders the objects in the world capable of being used as materials for thinking and feeling. It is the lack of definition of objects which ever and again provides new transitions to other objects (since that which is each time represented or imagined need neither be completely filled in as to detail, nor preserved); the lack of definition without which the independent action of thought would be impossible—and the sensuous vividness which is a result of the spiritual energy that is expended when a language is used. Thinking never treats of an object as isolated and never uses the sum total of its reality. It always skims off its surface relationships, conditions, points of view, and combines these. But a word is by no means merely an empty substratum into which certain details may be placed, but it is a sensuous form which by its incisive simplicity spontaneously indicates that the expressed object, too, should be represented only according to the needs of thought, and, by its origin in an independent psychic act, reorders the merely perceptive psychic capacities back into their boundaries. Moreover, by its capacity for change and its analogic relationship to other linguistic elements, it prepares the connectedness which thinking tries to find out in the world and bring out in its own products. (Finally, by its transitoriness it bids us tarry at no point but hurry on to whatever end itself and all the other words are tending.) In all these respects, the kind of sensuous form a word has . . . is in no way a matter of indifference, and it may be justly asserted that even when words of different languages designate the same, completely sensuous, object, they are by no means perfect synonyms. Whoever utters *hippos, equus,* or *Pferd,* by no means says completely the same thing three times. [III, 169 f.]

---

[1] This passage blends a Romantic emphasis on feeling with a Kantian emphasis on the constitutive powers of the mind, suggesting that in certain respects the two notions influence each other.

[2] The statement opposes Locke's view (above, page 282).

from
Introduction to General Linguistics (1810–1811)

Every language sets certain limits to the spirit of those who speak it; it assumes a certain direction and, by doing so, excludes many others. [VII, 621]

from
Announcement of an Essay on the Language and Nation of the Basques (1812)

Language everywhere mediates, first between infinite and finite nature, then between one individual and another. Simultaneously and through the same act it makes union possible and itself originates from it. The whole of its nature never lies in singularity but must always simultaneously be guessed or intuited from otherness. But neither can it be fully explained from oneness and otherness together; it simply is (like everything in the presence of which true mediation occurs) something individuated, unique, incomprehensible. It is something which is given by the idea of union, of the reconciliation of what for us and our way of thinking must always be opposites, and it is a something which is given only in this connection. Linguistic study—which must, in order to avoid becoming chimerical, always begin with the totally dry, pedantic, in fact mechanical analysis of the corporeal, constructible elements of language—thus leads to the depths of humanity. Only one must free oneself of the notions that language can be separated from that which it designates as, for example, the name of a person from the person, and that it is a product of reflection and agreement, an agreed-upon code, as it were, or in fact that it is any work of man at all (in the common sense in which one takes that phrase), not to mention the work of some individual. A true, inexplicable miracle, it breaks loose from the mouth of a nation, and—no less marvellous, though seen by us every day with indifference—it breaks daily through the gurgle of any baby. It is the brightest trace and the surest proof of the fact (leaving out for the moment the celestial relatives of mankind) that man does not possess an absolute, segregated individuality, that "I" and "Thou" are not merely interrelated but—if one could go back to the point of their separation—truly identical concepts, and that there exist, therefore, only concentric circles of individuality, beginning with the weak, frail single person who is in need of support and widening out to the primordial trunk of humanity itself. Otherwise all understanding would be impossible into all eternity. [III, 296–97]

from
On Comparative Linguistics (1820)

Language, I am fully convinced, must be looked upon as being an immediate given in mankind. Taken as a work of man's reason, undertaken in clarity of consciousness, it is wholly inexplicable. Nor does it help to supply man with millennia upon millennia for the "invention" of language. Language could not be invented or come upon if its archetype were not already present in the human mind. For man to understand but a single word truly, not as a mere sensuous stimulus (such as an animal understands a command or the sound of the whip) but as an articulated sound designating a concept, all language, in all its connections, must already lie prepared within him. There are no single, separate facts of language. Each of its elements announces itself as part of a whole. As natural as the supposition of the gradual development of languages is, yet the "invention" of language could only happen all at once. Man is man only through language: to invent language, he would have to be man already. As soon as one imagines that it happened gradually . . . , that by means of a bit more invented language, man became more human, and being more human, thus was enabled to invent a little more language, one fails to recognize the indivisibility of human consciousness and human speech, and the nature of the intellectual act which is necessary to comprehend but a single word, but which then suffices to comprehend all of language.

Naturally this does not mean that one is to think of language as a given that is complete and finished, for then one could not comprehend how a man could understand or use any single given language. It necessarily grows out of an individual, gradually growing up with him, but in such a way that its organization does not lie, like an inert mass, in the dark of a man's soul till it is brought forth, but instead that its laws condition the functions of thought. Thus the very first word gives the hint of and presupposes the whole rest of the language. If one seeks an analogy for this—and there is really nothing comparable to it in the whole realm of the mind—one might remember the natural instincts of animals and call language an intellectual instinct of the mind. [IV, 14 f.]

Thinking is not merely dependent on language in general but, up to a certain degree, on each specific language. People have wished, to be sure, to replace the words of the various languages by universally valid signs, as lines, numbers and algebraic symbols serve in mathematics. But only a tiny part of that which is thinkable can be designated that way, because such symbols by their very nature fit only those concepts which can be produced by mere synthetic construction or are otherwise formed by rationality alone. But where the raw materials of inner perception and sensation are to be imprinted with conceptualization, everything depends on the individual way of looking at things of an individual human being whose language is an inseparable part of him. All attempts to cancel out the many unique signs for eye and ear and replace them with a few general ones are but methods of abbreviated translation. It would be folly and delusion to imagine that such methods might transport one beyond the circumscribed limits of one's own language—not to mention all language. Of course a central point at which languages might meet may be sought for, and even found, and it is necessary when doing comparative studies of language (grammatical as well as lexical) to keep one's eye directed toward such a center. For . . . there is a number of things which can be determined and defined a priori and hence separated from all conditionalities of a given language. But on the other hand, there is a far greater number of concepts, and grammatical peculiarities as well, which are woven so indissolubly into the individuality of their language that they can neither be held by a thread of inner perception as hovering above all languages, nor translated from one language into another. A most significant part of the content of each language stands in a relation of such undoubted dependency on it that its specific utterance cannot be a matter of no consequence. [IV, 21 ff.]

The mutual interdependence of thought and word illuminates clearly the truth that languages are not really means for representing already known truths but are rather instruments for discovering previously unrecognized ones.[3] The differences between languages are not those of sounds and signs but those of differing world views. Herein is contained the reason for and the final aim of all linguistic study. The sum of the knowable, that soil which the human spirit must till, lies between all the languages and independent of them, at their center. But man cannot approach this purely objective realm other than through his own modes of cognition and feeling, in other words: subjectively. Just where study and research touch the highest and deepest point, just there does the mechanical, logical use of reason—whatever in us can most easily be separated from our uniqueness as individual human beings—find itself at the end of its rope. From here on we need a process of inner perception and creation. And all that we can plainly know about this is its result, namely, that objective truth always rises from the entire energy of subjective individuality. [IV. 27]

In no two languages do we find completely equivalent words designating incorporeal objects: we find words whose meaning is related, to be sure, but none whose is the same. . . . An extremely interesting demonstration of this might be given in connection with *psyche, anima, âme, alma, Seele, soul,* etc. . . . Such comparison can usually be made only between languages that have a literature. To make such studies would demand profound absorption in each language considered, and yet all language is so rich and fruitful in its eternal youthfulness, its eternal mobility, that the true sense, the sum total of all the connotations of such a word taken as a totality, could never be defined or completed, never be designated in all its grandeur. Time subtracts from it, changes it, adds to it;

---

[3] Humboldt here foreshadows Cassirer's views (below, page 1016).

words grow richer or poorer in content; they are construed sometimes sharply, sometimes loosely. In language, the creative archetypal energies of humanity are active—that deep reservoir of capacity in us whose existence and nature, can neither be understood nor denied. [IV, 248 f.]

from
On the National Characteristics of Languages (1822)

Man thinks, feels, and lives within language alone and must be formed by it, in order—to mention only one aspect—to understand art, which by no means acts through language. But he senses and knows that language is only a means for him; that there is an invisible realm outside it in which he seeks to feel at home and that it is for this reason that he needs the aid of language. The most commonplace observation and the profoundest thought, both lament the inadequacy of language. Both look upon that other realm as a distant country toward which only language leads—and *it* never really. All higher forms of speech are a wrestling with this thought, in which sometimes our power, sometimes our longing, is more keenly felt. [IV, 432]

from
Basic Characteristics of Linguistic Types (1824–1826)

In the nature of tone as such lies the true individuality of each language. Whatever one may do or try to do in order to describe the peculiarity of a language, all one succeeds in defining ever more closely is the genre to which it belongs. As *this* language, however, and no other, it expresses itself only before the listening ear. Although the alphabet of the whole human race is enclosed by certain not even very wide limits, each people with a language of their own have their own tonal system which excludes certain tones altogether, demonstrates strong preference for others, uses different ones to designate different classes of concepts, treats tone combinations in certain ways, etc. One may compare this with the various screeches and tonal varieties of the various animal species. [V, 379]

No one when he uses a word has in mind exactly the same thing that another has, and the difference, however tiny, sends its tremors throughout language, if one may compare language with the most volatile element. With each thought, each feeling, this difference returns, thanks to the element of unvarying identity in individuality, and finally forms a mass of elements which singly went unnoticed. All understanding, therefore, is always at the same time a misunderstanding—this being a truth which it is most useful to know in practical life—and all agreement of feelings and thoughts is at the same time a means for growing apart. [V, 396]

from
On the Episode from the *Mahabharata* Known as the *Bhagavad-Gita II* (1826)

Linguistic usage in everyday life must of course be different from linguistic usage in inward life, representing ideas and feelings, since the speaker in either case partakes of a wholly different mood. For the sharper and purer a thought hovers before his mind, the less it can be endured if the form of speech in which it will be cast is inappropriate. This is the origin of prose—and one should not call everything prose which is not verse. For their fields diverge only where careful attention is given to the form of presentation. The only true view of prose is that it is derived from poetry which always comes first when any language is treated as an art form.[4] For rhythm is the lifeblood of prose as well, and it is not even free of meter, being rather an extension of the narrowly binding meter of poetry. The characteristic difference between poetry and prose, however, is that prose declares by its form that it wishes to accompany and serve thought. Poetry cannot do without at least appearing to control thought or actually bringing it forth. [V, 343]

from
On the Differences in Human Linguistic Structure (1830–1835)

In thinking, a subjective activity forms itself an object. For no type of imaginative representation may be considered a merely receptive apperception of an already existent object.[5] The activity of the senses must be synthetically joined with the inner action of the spirit. From their connection the imaginative representation tears itself loose, becomes objective in relation to the subjective energy, and then returns to it, having first been perceived in its new, objective form. For this process language is indispensable. For while the spiritual endeavor expresses itself through the lips, its products return through the very ears of the speaker. The representation is therefore truly transformed into actual objectivity without therefore being withdrawn from subjectivity. Only language can accomplish this, and without this constant transformation and retransformation in which language plays the decisive part even in silence, no conceptualization and therefore no true thinking is possible. Without reference, therefore, to the communication between persons, the act of speaking is a necessary condition of thinking even in a single individual in complete solitude. So far as actual reality is concerned, of course, language develops only socially and man understands himself only by having tested the understandability of his words on others. For the objectivity is intensified when the word which one has formed oneself re-echoes from someone else's mouth. And yet nothing is robbed from the simultaneous subjectivity because every human being feels humanly allied to other human beings; it is, in fact, likewise intensified since the representation now transformed into language no longer belongs exclusively to a single subject. By being imparted to others, it joins the collectivity of the entire human race, of which each individual carries a single modification which longs for the wholeness which can only come through the others. The greater and more varied the social operations on language, the more it gains, other conditions being equal. What makes language necessary in the simple act of thought production, is repeated over and over in man's spiritual life; social communication through language affords man conviction and stimulation. The thinking function requires something like itself and yet separated from itself. It is kindled by the sameness; the separateness gives it a touchstone for the validity of its inner products. Although the epistemological ground for truth, for absolute permanence, can only lie within the human being, his spiritual efforts to attain it are ever accompanied by the danger of delusion. Immediately feeling as he does only his ephemerality and his limitations, man must actually look upon this epistemological ground as something lying outside himself. And one of the most powerful means for drawing near it, for measuring its distance from himself, is social communion with others. All speech, beginning with the simplest, is a relating of that which is separately sensed and felt to the common nature of mankind.

---

[4] This statement agrees with Vico's (above, page 321) and, later, Frye's (below, page 1136).

[5] Here von Humboldt reveals most clearly his neokantian views.

It is no different so far as understanding is concerned. It is present in the psyche only by its own activity. Understanding and speaking are but different operations of the same linguistic capacity. Communal speech is never to be compared with the handing on of a given material. The materials of speech must be developed by the intrinsic capacity of listener as well as speaker; what the listener receives is only the stimulus that attunes him harmoniously to the other. It is very natural for human beings to give out immediately with what they have just heard. Thus the whole of language lies within each human being, which only means that each of us contains a striving, regulated by a definitely modified capacity, which both stimulates and restricts, gradually to produce the entire language, as inner or outer demands dictate, and to understand it as it is produced by others.

Understanding as we have just discussed it, however, could not rest upon inner spontaneous activity, and communal speaking would have to be something other than merely mutual awakening of the linguistic capacity of the listeners, if human nature did not lie in the diversity of its individuals, split off from the basic unity of nature, as they are. The comprehension of words is something quite different from the understanding of unarticulated sounds, and comprises a great deal more than the mere mutual evocation of sounds and the objects they signify. Words, to be sure, may also be taken as indivisible wholes, just as in writing one sometimes recognizes the sense of a word group without as yet being certain of its alphabetical composition. It is possible that the child's psyche operates like that when it first begins to understand. But just as not merely the sensory understanding which we share with animals but also the specific human linguistic capacity is stimulated (and it is far more probable that even in an infant there is no moment when this does not hold true, in however small a degree), so the word, too, is perceived as articulated. Now that which is added to the mere evocation of a word's significance by the articulation is that it presents it directly through its form as part of an infinite whole—that of a language. For it is a language that gives us the possibility, even if we know only individual words of it, to form from its elements a truly unlimited number of other words, in accordance with feelings and rules which define them, and thereby to create a relationship among concepts. But our psyche would lack all comprehension of this artful mechanism, it would comprehend articulation no better than a blind man color, if it did not contain an intrinsic capacity to realize that latent possibility. For language simply cannot be looked upon as though it were a collection of materials lying visible and gradually communicable before us, but must be considered forever in process, where the laws of generation are constant but the extent and in a sense even the kind of product remain wholly indefinite. When infants learn to speak, the process cannot be described in terms of the simple addition of words of vocabulary, their retention in memory, and the subsequent attempts at repetitive babbling, but only as a growth of the child's linguistic capacity, judged by age and practice. What has been heard does more than merely communicate itself; it imparts skill to understand more easily what hasn't yet been heard; it casts sudden light upon what was heard long ago but not understood at the time; it sharpens the urge and the capacity to draw more and more of what is heard into memory and to let less and less of it roll by as mere sound. Progress in linguistic capacity is therefore not measurable in even advances, as is progress in—say—vocabulary learning . . . but is constantly intensified and stepped up by the mutual interaction of the material and the child's ability to handle it. A further proof that children do not mechanically learn their native language but undergo a development of linguistic capacity is afforded by the fact that all children, in the most different imaginable circumstances of life, learn to speak within a fairly narrow and definite time span, just as they develop all their main capacities at certain definite growth stages. But how could the listener master the spoken word just by the developmental process of a separate isolated capacity growing in him if there did not underlie speaker and listener alike the same nature, merely divided into mutually corresponding individuality, so that a signal as subtle but as profoundly rooted in nature as is articulated sound is sufficient to stimulate both and mediate a harmony between them!

An objection to this argument might be found by pointing out that if children are transplanted before they learn their native tongue, they develop their linguistic capacity in the foreign one. This undeniable fact, it might be said, clearly shows that language is the mere reproduction of what is heard, depending entirely on social intercourse without consideration of the unity or diversity of the people involved. In the first place, however, it has by no means been determined by exact tests that the inclination toward such children's native speech did not have to be overcome at some cost to the finest nuances of skill in the adopted language. But even disregarding this possibility, the most natural explanation is simply that human beings are everywhere human and the development of linguistic capacity may therefore take place with the aid of any given individual. That doesn't mean that it comes any less from the individual's innate nature; only, since it always needs outer stimulus as well, it must become analogous to whatever stimulus it receives. This it can do, since all human languages are interrelated in some sense. Nonetheless the binding force of closely related origins is plain enough to behold in the division of nations. Nor is it difficult to understand, since national origins are so predominantly powerful in their effect on individuality, and the various languages so intimately related with these origins. If language were not truly connected through its origins in the depths of human nature with even the physical hereditary processes, how then could one's native tongue have so much power and intimacy for the ear of the uneducated and educated alike, that after a long separation from it it greets one like the sound of magic and creates deep yearning for itself during one's separation from it? This obviously is not a matter of the spiritual content of any language, of its expressed thoughts or feelings, but of the most inexplicable and individual element in it: the sound. When we hear the sound of our native tongue it is as though we heard a part of our self.

And even when we consider the products of language, the notion that it consists but of the designation of perceived objects is not confirmed. With this function alone, the profound and full contents of language can never be exhausted. Just as no concept is possible without language, so no object is possible without it for the psyche, since even external ones receive their intrinsic substance only through language. But the entire method of subjective perception of objects goes necessarily into the development and use of language. For words are born of the subjective perceptions of objects; they are not a copy of the object itself but of the image of it produced in the psyche by its perception. And since subjectivity is unavoidably mingled with all objective perception, one may—quite independently of language—look upon each human individuality as a singular unique standpoint for a world-view. But it becomes far more so through language, since words when confronted with psyche turn themselves into objects, an intrinsic significance being added to them, and thus produce a new characteristic quality. This, being one which characterizes the sound of speech, presents thoroughgoing analogies within a language, and since the language of a given nation is already characterized by a similar subjectivity, each language therefore contains a characteristic world-view. As individual sound mediates between object and person, so the whole of language mediates between human beings and the internal and external nature that affects them. Man surrounds himself by a world of sounds in order to take into himself the world of objects and operate on them. What I am here saying outdistances in no way the simple truth. Man lives with objects mainly, in fact exclusively, since feeling and acting depend on his mental images, as language turns them over to him. The same act which enables him to spin language out of himself enables him to spin himself into language, and each language draws a circle around the people to whom it adheres which it is possible for the individual to escape only by stepping into a different one. The learning of a foreign language should therefore mean the gaining of a new standpoint toward one's world-view, and it does this in fact to a considerable degree, because each language contains the entire conceptual web and mental images of a part of humanity. If it is not always purely felt as such, the reason is only that one so frequently projects one's own world-view, in fact one's own speech habits, onto a foreign language.

One must not think of even the earliest origins of language being limited to a sparse number of words, as one frequently does if one thinks of language not originating in free human sociality, but rather as limited to acts of mutual assistance—a point of view facilitated by the reduction of early humanity to an imaginary status of "children of nature." These notions are among the most erroneous views one could possibly form regarding language. Man is not as helpless as all that, and besides, inarticulated sounds would suffice for the purpose of mere mutual aid in trouble. Language is human even in its very beginnings, and extends broadly without special purposes to all objects of random sensory perception or inner operation. Even (and especially in fact) the languages of so-called savages, who after all should be fairly close to a state of nature as we think of the phrase, show a fullness and diversity of expression which far exceeds simple needs. Words well up from the breast of their own free will, without need or intention, and there doubtless never was a wild wandering horde in any of the earth's desolate places which did not already have its songs. For man, as an animal species, is a singing creature, though one who joins thoughts to the tones.

But language does not merely transplant an undefined number of material elements from nature into the psyche. It also acquaints it with the aspects of form which come to us from the whole complex. Nature unfolds before us a bright many-colored diversity, rich with configurations affecting all our senses, and irradiated by a luminous clarity. Our power of reflection discovers in this richness a regularity or conformity to law which suits our spirit form. Quite apart from the corporeal existence of things there clings to their outlines a magic haze of outward beauty, as though it were made for man's sake alone, in which the conformity to law is wedded to the sensory material in a way which moves and overwhelms us but which we cannot explain. All these things we find again in the analogical echoes of language, for language can represent the state of affairs as we find it. For by entering the world of sound with the aid of language, we do not leave the real world that surrounds us. The conformity to law found in nature is related to that found in linguistic structure, and by stimulating man to perform his loftiest, most human activities, it furthers his understanding of the formal impression that nature makes, since it too cannot be considered other than a development of spiritual energies, however inexplicable. Through the rhythmic and musical form inherent in related sounds, language—affecting yet another human field—heightens the impression of natural beauty in man, but even independent of this, affects the psyche's mood by just the accents of speech.

Language, being the mass of its products, is different from whatever fragment is spoken at a given time. And before we leave this chapter we must tarry awhile at that difference. A language as a whole contains everything transformed by it into sounds. But just as the materials of thought and the infinitude of its connections can never be exhausted, neither can the number of things to be designated and related by language. A language therefore consists of not only its already formed elements but above all of a methodology for continuing the spiritual labor for which it designates the orbits and the forms. The firmly composed elements form a certain kind of dead mass of language, but this mass carries the living germ of never-ending definability. At each given point and in each given epoch, therefore, language just like nature appears to man as an inexhaustible reservoir, in contrast to all he has already thought and known, a reservoir in which his spirit may still discover the unknown, and his inward sensation may still become aware of things not felt this way before. Each time language is used by a truly original and great genius, that is what happens. And the human race needs for the inspiration of its constantly advancing intellectual efforts and the unfolding of its spiritual lifestuff, the ever open vista beyond what has already been achieved, the assurance that the infinite entanglements yet remaining may gradually be dissolved. But language contains a dark unrevealed depth, as well, and a depth which reaches in two directions. For backwards as well as forwards, it flows out of (or into) an unknown wealth of materials which may be recognized only up to a point and then vanishes from view, leaving the feeling of unfathomable mystery. Language has this infinity, with neither end nor beginning except for a very brief past, in common, so far as our view is concerned, with the whole existence of the human race. But we feel and intuit in language plainly and vividly how even the remote past is related to the feeling of the present, since it has passed through the human sensations of former generations and has retained their living breath. But these same generations are nationally and familially related to us in the same sounds of their native tongue which becomes the expression of our own feelings.

This double aspect of language, partly firm and partly fluid, produces a unique relationship between it and the generations that speak it. They produce within it a depository of words and a system of rules by which it grows in the course of the centuries into an independent power. Our attention was earlier focused on the fact that a thought taken up by language becomes an object for the psyche and thus exerts an effect upon it from the outside. But we have been looking at this object mainly as it has developed from the subject, at the effect, in other words, as emanating from that upon which it reacts. Now we must also look at the process from the opposite point of view, according to which language is truly a foreign object, its effect actually emanating from something quite other than that upon which it reacts. For language must necessarily belong to a twosome and at the same time it is truly the property of the entire human race. Since in writing, too, it holds out slumbering thought to be awakened by the spirit, it builds for itself a unique existence which can only attain validity in any given act of thought, but which in its totality is nonetheless independent of thought. The two contradictory views here suggested—that language is both extrinsic to the psyche and a part of it, that it is both independent from it and dependent on it—pertain to it in reality and make out the individuality of its nature. Nor must we seek to solve the contradiction by saying that language is in part extrinsic and independent, and in part neither. For language is objective and independent to precisely the same degree that it is subjective and dependent. For it has no abiding place anywhere, not even in writing; what we called its dead part must always be newly generated in thought; it must always transfer itself alive into speech or understanding, in other words become wholly transferred to the subject. But this same act of regeneration is what makes it also into an object. To be sure, it experiences the entire operative influence of the human individual, but this same operative influence is bound by what it is and has been. The true solution of the paradox lies in the unity of human nature. Whatever originates with what is one and the same with myself, dissolves the concepts of object and subject, of dependence and independence. Language is mine because I produce it as I do. And because the reason I produce it as I do lies in the speaking and having spoken of all the generations of men, insofar as uninterrupted linguistic communication reaches, it is the language itself that gives me my restrictions. But that which restricts and confines me came into language by human nature of which I am a part, and whatever is strange in language for me is therefore strange only for my individual momentary nature, not for my original, true nature as a human being. [VII, 13–64]

* * *

There are two phenomena of language in which [all the individual aspects of the mutual influences of the character and the language of nations] not only most decisively coincide, but which so reveal the influence of their wholeness that all concepts of particularity disappear from them. These are poetry and prose. We must call them phenomena of language, since even the original structure of a language tends to direct it to one or the other, or, where its form is truly a great one, to the proportionate development of both, and since they in turn react back upon the structure of the language. Truly, however, they are first of all the developmental track of intellectuality itself and must, when its structure is not deficient and its orbit not disturbed, necessarily unwind themselves along it. Poetry and prose therefore require most careful study, not only in relation to each other, but particularly in connection with their relative time of origin.

If we look at both from their most concrete as well as their most ideal side simultaneously, we see that they take separate paths to attain similar goals. For both move from reality toward something which does not belong to reality. Poetry conceives of reality in its sensuous phenomenality, as it is externally and internally perceived by us, but it is unperturbed about whatever makes reality be what it is. In fact poetry specifically rejects anything of a reasoning or causal character. It relates the sensuous phenomena in creative imagination, and guides us through them to a view of an artistically ideal wholeness. Prose looks precisely for the roots of reality which connect it to existence in all the vast network of its connections. It then intellectually combines facts with facts and concepts with concepts, striving for an objective connection of them all within an idea. The difference between poetry and prose as just outlined is drawn only as it expresses itself in their true essence, to be sure. If one looks only at any given piece of poetry or prose as it is actually found in a given language . . . one finds that the inner direction here called prose may be executed in metrical or rhythmic language and that of poetry in unmetrical and arhythmic language, but only at some cost to both. For prose expressed in poetic form has neither the character of poetry nor wholly that of prose, and likewise with poetry disguised as prose.[6] Poetic contents perforce bring about poetic garments, and there are many instances of poets who, feeling this power, have completed in verse something they began in prose.

What both poetry and prose have in common—to return now to their intrinsic nature—is the tension and the comprehensiveness of soul that is necessitated by full penetration of reality coupled with attainment of an ideal relationship of infinite variety, plus the ability to recollect the mind to a consistent pursuit of a once decided upon path. Yet this too must be rightly understood to mean that such a path never excludes its opposite within the spiritual economy of a nation and its language, but actually furthers it as well as itself. Both, the mood of poetry and that of prose, must complement each other to form the communal spirit which permits men to sink their roots deep into reality, keeping always in mind that the deeper the roots, the more joyous the towering into a freer element. The poetry of a people has not reached its summit until by its variety and its free flexibility it announces the possibility of an equivalent development of prose. Since the human spirit, as we conceive of it in strength and freedom, needs to attain both configurations, we know one by the other, just as we can tell from a fragment of sculpture that it once was part of a grouping.

---

[6] This statement recalls earlier discussions going back to Aristotle (above, page 52) on just what the true natures of poetry and prose are. See also Vico (above, page 321).

Prose however may be used in another sense as well. It can stop at the mere presentation of facts and at totally external purposes. It may be used for the mere communication of things, rather than the awakening of ideas and feelings. In such a case it does not depart from ordinary speech and never reaches the true heights of what we have been calling prose. Prose in this wider sense then cannot be considered a developmental track of intellectuality; its references are not to form but to matter alone. But wherever prose pursues its higher path it needs, just like poetry, certain special means for reaching deeply into the human psyche. It has to raise itself to that ennobled form of speech of which alone we may speak if we wish to consider it the true mate of poetry. Prose in this intrinsic sense demands a comprehension of its object which requires all the combined capacities of the total psychic constitution. This means a treatment of the object which shows it as radiating toward all the receptive subjects upon which it works. Discriminating rationality is not active by itself; all the other powers of mind aid it, thus forming the point of view properly known as "spirited," "inspired." In such a union of powers, the spirit carries in addition to its work upon a given object, the imprint of its mood over into speech. Language, elevated by the verve of thought, shows forth its advantages but subordinates them to purposes of the whole spirit. It is the moral feeling-life that imparts itself to the language; the soul that shines through the style. In a manner wholly individual and peculiar to itself, there reveals itself in prose, through the subordination and the dialectic of its sentences, the logical eurythmy which corresponds to thought development. This is the internal command which ordinary speech obeys when it becomes elevated by a special purpose. If an author yields too far to it, he produces a mixture of poetry and rhetoric prose. But in "spirited," "inspired" prose, all the details here listed singly act together, thereby sketching out the whole living birth of a thought, the whole process of spirit's wrestling with an object. Wherever permitted, the thought shapes up like a free spontaneous inspiration and performs in the realm of truth what spontaneous beauty performs in the realm of poetry.

From all this we may see that poetry and prose are conditioned by similar general demands. In both there must be an inward and spontaneous verve which lifts and carries the spirit. Man in his whole individuatedness must move with his thought toward both outer and inner world and, understanding particulars, leave to them that form which relates them to the whole. In their directions, however, and their means for achieving their effects, poetry and prose are different and can really never be mingled. In reference to language we should particularly note that poetry's true nature is inseparable from that of music,[7] whereas prose entrusts itself to language alone. [VII, 193 ff.]

---

[7] The identification of poetry with music tends at this time to replace the identification of poetry with painting that flourished from Simonides (c. 556–468? B.C.) through the eighteenth century.

John Keats

1795–1821

Many of Keats's letters are remarkable for their wealth of speculation, sometimes derivative of others, packed into a few sentences. Keats thinks of beauty as providing a form of knowledge that cannot be gained by means of "consecutive reasoning." He makes a similar distinction when he opposes the "life of sensations" to that of "thought." His position is not, however, that of a sensualist. He sees thought as the abstracting mode of distancing and dehumanizing objects. The life of sensations he associates with empathetic experience: "If a sparrow come before my window I take part in its existence and pick about the gravel." Poetry, he argues, breaks down the boundaries erected by "thought," which always divides experience into subject and object. Yet this view does not preclude Keats's associating the experience of art with "speculation," on which the imagination is free to act. Like Kant (above, page 420) and Coleridge (above, page 497), he writes as if he distinguishes the beautiful from the agreeable and disagreeable: "The excellence of every art is its intensity, capable of making all disagreeables vanish." *King Lear* is his example. If you have unpleasantness in art there must be a "momentous depth of speculation excited, in which to bury its repulsiveness." The notion of intensity is a forerunner of New Critical emphasis on poetic language.

Since the poem's mode of truth is beauty, the poem cannot be a vehicle only of consecutive reasoning or dogma. The poet must possess "negative capability." He must be able to remain in "uncertainties, mysteries, doubts, without any irritable reaching after fact and reason." Thus Keats offers a writerly version of the disinterest that Kant requires of the reader or viewer (above, page 420). The poet's mode of knowledge is therefore not discursive. Belief becomes a word irrelevant to criticism because it is associated with discursive thought, not beauty. One of the reasons the poet is or must be freed from belief, in this sense of the term, is that a poem grows like a plant: "If poetry comes not as naturally as the leaves to a tree it had better not come at all." The poem's integrity is internal, not externally imposed by some code of belief. The metaphor by which this idea is expressed is the characteristically Romantic one of organicism.

Keats's complete works are available in the edition by H. Buxton Forman (in five volumes, 1900–1901). The letters have been edited by Forman, revised edition (1952), and by Hyder E. Rollins (in two volumes, 1958). See C. D. Thorpe, *The Mind of John Keats* (1926); C. L. Finney, *The Evolution of Keats's Poetry* (1936); W. J. Bate, *Negative Capability* (1939); J. R. Letter to Benjamin Bailey[1]

November 22, 1817

I am certain of nothing but of the holiness of the heart's affections and the truth of imagination—What the imagination seizes as beauty must be truth[2]—whether it existed before or not—for I have the same idea of all our passions as of love they are all in their sublime, creative of essential beauty—in a word, you may know my favorite speculation by my first book and the little song I sent in my last—which is a representation from the fancy of the probable mode of operating in these matters—The imagination may be compared to Adam's dream[3]—he awoke and found it truth. I am the more zealous in this affair, because I have never yet been able to perceive how any thing can be known for truth by consecutive reasoning—and yet it must be—Can it be that even the greatest philosopher ever arrived at his goal without putting aside numerous objections—However it may be, O for a life of sensations rather than of thoughts! It is "a vision in the form of youth" a shadow of reality to come—and this consideration has further convinced me for it has come as auxiliary to another favorite speculation of mine, that we shall enjoy ourselves hereafter by having what we called happiness on earth repeated in a finer tone and so repeated—And yet such a fate can only befall those who delight in sensation rather than hunger as you do after truth—Adam's dream will do here and seems to be a conviction that imagination and its empyreal reflection is the same as human life and its spiritual repetition. But as I was saying—the simple imaginative mind may have its rewards in the repetition of its own silent working coming continually on the spirit with a fine suddenness—to compare great things with small—have you never by being surprised with an old melody—in a delicious place—by a delicious voice, felt over again your very speculations and surmises at the time it first operated on your soul—do you not remember forming to yourself the singer's face more beautiful than it was possible and yet with the elevation of the moment you did not think so—even then you were mounted on the wings of imagination so high—that the prototype must be hereafter—that delicious face you will see—What a time! I am continually running away from the subject—sure this cannot be exactly the case with a complex mind—one that is imaginative and at the same time careful of its fruits—who would exist partly on sensation partly on thought—to whom it is necessary that years should bring the philosophic mind—such a one I consider yours and therefore it is necessary to your eternal happiness that you not only drink this old wine of heaven which I shall call the redigestion of our most ethereal musings on earth; but also increase in knowledge and know all things. I am glad to hear you are in a fair way for Easter—you will soon get through your unpleasant reading and then!—but the world is full of troubles and I have not much reason to think myself pestered with many—I think Jane or Marianne[4] has a better opinion of me than I deserve—for really and truly I do not think my brother's illness connected with mine—you know more of the real cause than they do—nor have I any chance of being racked as you have been—you perhaps at one time thought there was such a thing as worldly happiness to be arrived at, at certain periods of time marked out—you have of necessity from your disposition been thus led away—I scarcely remember counting upon any happiness—I look not for it if it be not in the present hour—nothing startles me beyond the moment. The setting sun will always set me to rights—or if a sparrow come before my window I take part in its existence and pick about the gravel. The first thing that strikes me on hearing a misfortune having befalled another is this, "Well it cannot be helped. He will have the pleasure of trying the resources of his spirit." And I beg now, my dear Bailey, that hereafter should you observe anything cold in me not to put it to the account of heartlessness but abstraction—for I assure you I sometimes feel not the influence of a passion or affection during a whole week—and so long this sometimes continues I begin to suspect myself and the genuineness of my feelings at other times—thinking them a few barren tragedy tears.

Keats's letters have been published in several editions, the most complete and trustworthy of which is that by Hyder E. Rollins. The text is reprinted from Hyder E. Rollins, ed, *The Letters of John Keats, 1814–1821,* Vol. I (Cambridge, Mass.: Harvard University Press, 1958).

[1] Rev. Benjamin Bailey (1791–1853), influential friend to Keats.

[2] This statement recalls the final lines of *Ode on a Grecian Urn:* "Beauty is truth, truth beauty, that is all/Ye know on earth, and all ye need to know."

[3] Gen. II.21–23.

[4] Sisters to J. H. Reynolds (1794–1852), minor poet and friend of Keats.

Letter to George and Thomas Keats[5]

December 21, 1817

I spent Friday evening with Wells[6] and went next morning to see *Death on the Pale Horse*. It is a wonderful picture, when West's[7] age is considered; but there is nothing to be intense upon; no women one feels mad to kiss, no face swelling into reality. The excellence of every art is its intensity, capable of making all disagreeables evaporate, from their being in close relationship with beauty and truth—Examine *King Lear* and you will find this exemplified throughout; but in this picture we have unpleasantness without any momentous depth of speculation excited, in which to bury its repulsiveness. . . . I had not a dispute but a disquisition with Dilke,[8] on various subjects; several things dovetailed in my mind, and at once it struck me what quality went to form a man of achievement especially in literature and which Shakespeare possessed so enormously—I mean *negative capability,* that is when a man is capable of being in uncertainties, mysteries, doubts, without any irritable reaching after fact and reason—Coleridge, for instance, would let go by a fine isolated verisimilitude caught from the penetralium of mystery, from being incapable of remaining content with half-knowledge. This pursued through volumes would perhaps take us not further than this, that with a great poet the sense of beauty overcomes every other consideration, or rather obliterates all consideration.

from

Letter to John Taylor[9]

February 27, 1818

In poetry I have a few axioms, and you will see how far I am from their center. First, I think poetry should surprise by a fine excess and not by singularity—it should strike the reader as a wording of his own highest thoughts and appear almost a remembrance—Second, its touches of beauty should never be halfway thereby making the reader breathless instead of content: the rise, the progress, the setting of imagery should like the sun come natural to him—shine over him and set soberly although in magnificence, leaving him in the luxury of twilight—but it is easier to think what poetry should be than to write it—and this leads me on to another axiom. That if poetry comes not as naturally as the leaves to a tree it had better not come at all.

Letter to Richard Woodhouse[10]

October 27, 1818

As to the poetical Character itself (I mean that sort of which, if I am any thing, I am a Member; that sort distinguished from the wordsworthian or egotistical sublime; which is a thing per se and stands alone) it is not itself—it has no self—it is every thing and nothing—It has no character—it enjoys light and shade; it lives in gusto, be it foul or fair, high or low, rich or poor, mean or elevated—It has as much delight in conceiving an Iago as an Imogen.[11] What shocks the virtous philosopher, delights the camelion Poet. It does no harm from its relish of the dark side of things any more than from its taste for the bright one: because they both end in speculation. A Poet is the most unpoetical of any thing in existence; because he has no Identity—he is continually in for[12]— and filling some other Body—The Sun, the Moon, the Sea and Men and Women who are creatures of impulse are poetical and have about them an unchangeable attribute—the poet has none; no identity—he is certainly the most unpoetical of all God's Creatures. If then he has no self, and if I am a Poet, where is the Wonder that I should say I would write no more? Might I not at that very instant have been cogitating on the Characters of Saturn and Ops? It is a wretched thing to confess; but is a very fact that not one word I ever utter can be taken for granted as an opinion growing out of my identical nature—how can it, when I have no nature?

Percy Bysshe Shelley

1792–1822

Written in answer to Thomas Love Peacock's satirical attack on poetry, Shelley's *Defense of Poetry* makes perhaps greater claims for the poet than anyone else has dared. But for Shelley poetry is more than metrical language. It is the expression of imaginative thought that may appear in many verbal forms. Beginning with a distinction between synthesis and analysis, which he identifies with imagination and reason respectively, Shelley proceeds to attribute to the products of the imagination, which is for him fundamentally poetical, immense spiritual and cultural powers. Shelley does not acknowledge Peacock's argument, which implies a much narrower view of what poetry is, that the range of poetry is progressively diminished by the enlargement of the domain of reason. Shelley maintains that the poet refurbishes language, which would otherwise fall into decay and, as a result, bring about cultural decadence. As a creator of new linguistic possibilities the poet "legislates" and "prophesies": he helps remake the world by reconstructing the principal form through which we see it. To express this, Shelley employs an organic metaphor, characteristically Romantic: the poet's "thoughts are the germs of the flower and the fruit of latest time." Poetry sows the "seeds of social revolution." Because in a sense it is always new, poetry "purges from our inward sight the film of familiarity which obscures from us the wonder of our being. . . . It creates anew the universe." Like Peacock, Shelley presents a cyclical view of the history of poetry, but it lacks Peacock's notion of decline. In his view, the poetic spirit remains in its periodic rebirth a source of insight into universal ideas.

To describe the relation of man's mind to nature, Shelley employs a metaphor familiar to readers of other Romantics, that of the wind harp, or Aeolian lyre. But the lyre is more passive in its relation to the wind than is man's subject in relation to nature's object, and Shelley avers that man produces not merely melody from his experience but "harmony, by an internal adjustment of the sounds or motions thus excited to the impressions which excite them." To describe the act of poetic creation Shelley, like Keats (above, page 536), employs an organic simile, which he combines with an image similar to that of the Aeolian lyre; "The mind in creation is as a fading coal, which some invisible influence, like an inconstant wind, awakens to transitory brightness; this power arises from within, like the color of a flower which fades and changes as it is developed. . . ." Shelley adds to this the notion that what the poet imagines is never fully expressed in the poem, for when composition begins the idea is already fading. This view is frequently implied in Shelley's time. It conflicts with Blake's (above, page 448) and that of some later writers, who think of the poem as a created vision, not an expression of a prior one.

There has been much discussion of the extent to which Shelley is a Platonist. He disagrees, of course, with Plato's Socrates about poets, but he seems to accept the notion of the Platonic idea and is perhaps close to Plotinus in remarks like the one in which he declares that the poet "participates in the eternal, the infinite, and the one."

* * *

Shelley's complete works have been edited in ten volumes by Roger Ingpen and W. E. Peek (1927). John Shawcross has edited Shelley's *Literary and Philosophical Criticism* (1909). See M. T. Solve, *Shelley: His Theory of Poetry* (1927); Floyd Stovall, *Desire and Restraint in Shelley* (1931); B. P. Kurtz, *The Pursuit of Death* (1933); C. H. Grabo, *The Magic Plant* (1936); N. I. White, *Shelley* (1940); Carlos Baker, *Shelley's Major Poetry* (1948); J. A. Notopoulos, *The Platonism of Shelley* (1949); C. E. Pulos, *The Deep Truth: A Study of Shelley's Skepticism* (1954); Peter Butter, *Shelley's Idols of the Cave* (1954); Earle J. Schulze, *Shelley's Theory of Poetry* (1966); John W. Wright, *Shelley's Myth of Metaphor* (1970); Earl Wasserman, *Shelley: A Critical Reading* (1971); Richard Holmes, *Shelley: The Pursuit* (1974); Michael Scrivener, *Radical Shelley* (1982); Donald H. Reiman, *Percy Bysshe Shelley* (1990).

A Defense of Poetry

According to one mode of regarding those two classes of mental action, which are called reason and imagination, the former may be considered as mind contemplating the relations borne by one thought to another, however produced; and the latter, as mind acting upon those thoughts so as to color them with its own light, and composing from them, as from elements, other thoughts, each containing within itself the principle of its own integrity. The one is the τὸ ποιεῖν,[1] or the principle of synthesis, and has for its objects those forms which are common to universal nature and existence itself; the other is the τὸ λογιζεὶν,[2] or principle of analysis, and its action regards the relations of things, simply as relations; considering thoughts, not in their integral unity, but as the algebraical representations which conduct to certain general results. Reason is the enumeration of quantities already known; imagination is the perception of the value of those quantities, both separately and as a whole. Reason respects the differences, and imagination the similitudes of things. Reason is to the imagination as the instrument to the agent, as the body to the spirit, as the shadow to the substance.

Poetry, in a general sense, may be defined to be "the expression of the imagination": and poetry is connate with the origin of man. Man is an instrument over which a series of external and internal impressions are driven, like the alternations of an ever-changing wind over an Aeolian lyre, which move it by their motion to ever-changing melody. But there is a principle within the human being, and perhaps within all sentient beings, which acts otherwise than in the lyre, and produces not melody alone, but harmony, by an internal adjustment of the sounds or motions thus excited to the impressions which excite them. It is as if the lyre could accommodate its chords to the motions of that which strikes them, in a determined proportion of sound; even as the musician can accommodate his voice to the sound of the lyre.[3] A child at play by itself will express its delight by its voice and motions; and every inflection of tone and every gesture will bear exact relation to a corresponding antitype in the pleasurable impressions which awakened it; it will be the reflected image of that impression; and as the lyre trembles and sounds after the wind has died away, so the child seeks, by prolonging in its voice and motions the duration of the effect, to prolong also a consciousness of the cause. In relation to the objects which delight a child, these expressions are what poetry is to higher objects. The savage (for the savage is to ages what the child is to years) expresses the emotions produced in him by surrounding objects in a similar manner; and language and gesture, together with plastic or pictorial imitation, become the image of the combined effect of those objects, and of his apprehension of them. Man in society, with all his passions and his pleasures, next becomes the object of the passions and pleasures of man; an additional class of emotions produces an augmented treasure of expressions; and language, gesture, and the imitative arts, become at once the representation and the medium, the pencil and the picture, the chisel and the statue, the chord and the harmony. The social sympathies, or those laws from which, as from its elements, society results, begin to develop themselves from the moment that two human beings coexist; the future is contained within the present, as the plant within the seed; and equality, diversity, unity, contrast,

---

Shelley's *Defense of Poetry* was written in 1821 but not published until 1840.

[1] "Making."

[2] "Reasoning."

[3] On the Aeolian lyre see M. H. Abrams, "The Correspondent Breeze" in his (ed.) *English Romantic Poets* (1960), 37–54.

mutual dependence, become the principles alone capable of affording the motives according to which the will of a social being is determined to action, inasmuch as he is social; and constitute pleasure in sensation, virtue in sentiment, beauty in art, truth in reasoning, and love in the intercourse of kind. Hence men, even in the infancy of society, observe a certain order in their words and actions, distinct from that of the objects and the impressions represented by them, all expression being subject to the laws of that from which it proceeds. But let us dismiss those more general considerations which might involve an inquiry into the principles of society itself, and restrict our view to the manner in which the imagination is expressed upon its forms.

In the youth of the world, men dance and sing and imitate natural objects, observing in these actions, as in all others, a certain rhythm or order. And, although all men observe a similar, they observe not the same order, in the motions of the dance, in the melody of the song, in the combinations of language, in the series of their imitations of natural objects. For there is a certain order or rhythm belonging to each of these classes of mimetic representation, from which the hearer and the spectator receive an intenser and purer pleasure than from any other: the sense of an approximation to this order has been called taste by modern writers. Every man in the infancy of art observes an order which approximates more or less closely to that from which this highest delight results: but the diversity is not sufficiently marked, as that its gradations should be sensible, except in those instances where the predominance of this faculty of approximation to the beautiful (for so we may be permitted to name the relation between this highest pleasure and its cause) is very great. Those in whom it exists in excess are poets, in the most universal sense of the word; and the pleasure resulting from the manner in which they express the influence of society or nature upon their own minds, communicates itself to others, and gathers a sort of reduplication from that community. Their language is vitally metaphorical; that is, it marks the before unapprehended relations of things and perpetuates their apprehension, until the words which represent them become, through time, signs for portions or classes of thoughts instead of pictures of integral thoughts; and then if no new poets should arise to create afresh the associations which have been thus disorganized, language will be dead to all the nobler purposes of human intercourse. These similitudes or relations are finely said by Lord Bacon to be "the same footsteps of nature impressed upon the various subjects of the world";[4] and he considers the faculty which perceives them as the storehouse of axioms common to all knowledge. In the infancy of society every author is necessarily a poet, because language itself is poetry; and to be a poet is to apprehend the true and the beautiful, in a word, the good which exists in the relation, subsisting, first between existence and perception, and secondly between perception and expression. Every original language near to its source is in itself the chaos of a cyclic poem: the copiousness of lexicography and the distinctions of grammar are the works of a later age, and are merely the catalogue and the form of the creations of poetry.

But poets, or those who imagine and express this indestructible order, are not only the authors of language and of music, of the dance, and architecture, and statuary, and painting; they are the institutors of laws, and the founders of civil society, and the inventors of the arts of life, and the teachers, who draw into a certain propinquity with the beautiful and the true, that partial apprehension of the agencies of the invisible world which is called religion. Hence all original religions are allegorical, or susceptible of allegory, and, like Janus, have a double face of false and true. Poets, according to the circumstances of the age and nation in which they appeared, were called, in the earlier epochs of the world, legislators, or prophets: a poet essentially comprises and unites both these characters. For he not only beholds intensely the present as it is, and discovers those laws according to which present things ought to be ordered, but he beholds the future in the present, and his thoughts are the germs of the flower and the fruit of latest time. Not that I assert poets to be prophets in the gross sense of the word, or that they can foretell the form as surely as they foreknow the spirit of events: such is the pretense of superstition, which would make poetry an attribute of prophecy, rather than prophecy an attribute of poetry.[5] A poet participates in the eternal, the infinite, and the one; as far as relates to his conceptions, time and place and number are not. The grammatical forms which express the moods of time, and the difference of persons, and the distinction of place, are convertible with respect to the highest poetry without injuring it as poetry: and the choruses of Aeschylus, and the book of Job, and Dante's "Paradise," would afford, more than any other writings, examples of this fact, if the limits of this essay did not forbid citation.[6] The creation of sculpture, painting, and music, are illustrations still more decisive.

Language, color, form, and religious and civil habits of action, are all the instruments and materials of poetry; they may be called poetry by that figure of speech which considers the effect as a synonym of the cause. But poetry in a more restricted sense expresses those arrangements of language, and especially metrical language, which are created by that imperial faculty, whose throne is curtained within the invisible nature of man. And this springs from the nature itself of language, which is a more direct representation of the actions and passions of our internal being, and is susceptible of more various and delicate combinations, than color, form, or motion, and is more plastic and obedient to the control of that faculty of which it is the creation. For language is arbitrarily produced by the imagination, and has relation to thoughts alone; but all other materials, instruments, and conditions of art, have relations among each other, which limit and interpose between conception and expression. The former is as a mirror which reflects, the latter as a cloud which enfeebles, the light of which both are mediums of communications. Hence the fame of sculptors, painters, and musicians, although the intrinsic powers of the great masters of these arts may yield in no degree to that of those who have employed language as the hieroglyphic of their thoughts, has never equaled that of poets in the restricted sense of the term; as two performers of equal skill will produce unequal effects from a guitar and a harp. The fame of legislators and founders of religions, so long as their institutions last, alone seems to exceed that of poets in the restricted sense; but it can scarcely be a question, whether, if we deduct the celebrity which their flattery of the gross opinions of the vulgar usually conciliates, together with that which belonged to them in their higher character of poets, any excess will remain.

---

[4] Bacon (above, page 234), *On the Development of the Sciences* III, i.

[5] Compare Sidney (above, page 187); cf. Plato's *Cratylus* (above, page 45).

[6] Aeschylus (525–456 B.C.), Greek tragic dramatist; Dante (above, page 153).

We have thus circumscribed the word *poetry* within the limits of that art which is the most familiar and the most perfect expression of the faculty itself. It is necessary, however, to make the circle still narrower, and to determine the distinction between measured and unmeasured language; for the popular division into prose and verse is inadmissible in accurate philosophy.[7]

Sounds as well as thoughts have relation both between each other and towards that which they represent, and a perception of the order of those relations has always been found connected with a perception of the order of the relations of thoughts. Hence the language of poets have ever affected a certain uniform and harmonious recurrence of sound, without which it were not poetry, and which is scarcely less indispensable to the communication of its influence, than the words themselves, without reference to that peculiar order. Hence the vanity of translation; it were as wise to cast a violet into a crucible that you might discover the formal principle of its color and odor, as seek to transfuse from one language into another the creations of a poet. The plant must spring again from its seed, or it will bear no flower—and this is the burthen of the curse of Babel.[8]

An observation of the regular mode of the recurrence of harmony in the language of poetical minds, together with its relation to music, produced meter, or a certain system of traditional forms of harmony and language. Yet it is by no means essential that a poet should accommodate his language to this traditional form, so that the harmony, which is its spirit, be observed. The practice is indeed convenient and popular, and to be preferred, especially in such composition as includes much action: but every great poet must inevitably innovate upon the example of his predecessors in the exact structure of his peculiar versification. The distinction between poets and prose writers is a vulgar error. The distinction between philosophers and poets has been anticipated. Plato was essentially a poet—the truth and splendor of his imagery, and the melody of his language, are the most intense that it is possible to conceive.[9] He rejected the measure of the epic, dramatic, and lyrical forms, because he sought to kindle a harmony in thoughts divested of shape and action, and he forbore to invent any regular plan of rhythm which would include, under determinate forms, the varied pauses of his style. Cicero[10] sought to imitate the cadence of his periods, but with little success. Lord Bacon was a poet.[11] His language has a sweet and majestic rhythm, which satisfies the sense, no less than the almost superhuman wisdom of his philosophy satisfies the intellect; it is a strain which distends, and then bursts the circumference of the hearer's mind, and pours itself forth together with it into the universal element with which it has perpetual sympathy. All the authors of revolutions in opinion are not only necessary poets as they are inventors, nor even as their words unveil the permanent analogy of things by images which participate in the life of truth; but as their periods are harmonious and rhythmical, and contain in themselves the elements of verse; being the echo of the eternal music. Nor are those supreme poets, who have employed traditional forms of rhythm on account of the form and action of their subjects, less capable of perceiving and teaching the truth of things, than those who have omitted that form. Shakespeare, Dante, and Milton (to confine ourselves to modern writers) are philosophers of the very loftiest power.

---

[7] Shelley joins Aristotle (above, page 52) and many subsequent critics on this point.

[8] Gen. 11.1–9: Noah's descendants originally spoke one language, but they were punished for the arrogance of building the Tower of Babel and became unintelligible to each other.

[9] Shelley seems to imply that Plato is a dramatic poet who does not write metrically.

[10] Cicero (above, page 74).

[11] [Shelley] See *The String of the Labyrinth* and the essay on death particularly.

A poem is the very image of life expressed in its eternal truth. There is this difference between a story and a poem, that a story is a catalogue of detached facts, which have no other connection than time, place, circumstance, cause and effect; the other is the creation of actions according to the unchangeable forms of human nature, as existing in the mind of the creator, which is itself the image of all other minds. The one is partial, and applies only to a definite period of time, and a certain combination of events which can never again recur; the other is universal, and contains within itself the germ of a relation to whatever motives or actions have place in the possible varieties of human nature.[12] Time, which destroys the beauty and the use of the story of particular facts, stripped of the poetry which should invest them, augments that of poetry, and forever develops new and wonderful applications of the eternal truth which it contains. Hence epitomes have been called the moths of just history; they eat out the poetry of it. A story of particular facts is as a mirror which obscures and distorts that which should be beautiful: poetry is a mirror which makes beautiful that which is distorted.

The parts of a composition may be poetical, without the composition as a whole being a poem. A single sentence may be considered as a whole, though it may be found in the midst of a series of unassimilated portions; a single word even may be a spark of inextinguishable thought. And thus all the great historians, Herodotus, Plutarch, Livy,[13] were poets; and although the plan of these writers, especially that of Livy, restrained them from developing this faculty in its highest degree, they made copious and ample amends for their subjection, by filling all the interstices of their subjects with living images.

Having determined what is poetry, and who are poets, let us proceed to estimate its effects upon society.

Poetry is ever accompanied with pleasure: all spirits on which it falls open themselves to receive the wisdom which is mingled with its delight.[14] In the infancy of the world, neither poets themselves nor their auditors are fully aware of the excellence of poetry: for it acts in a divine and unapprehended manner, beyond and above consciousness; and it is reserved for future generations to contemplate and measure the mighty cause and effect in all the strength and splendor of their union. Even in modern times, no living poet ever arrived at the fullness of his fame; the jury which sits in judgment upon a poet, belonging as he does to all time, must be composed of his peers: it must be impaneled by time from the selectest of the wise of many generations. A poet is a nightingale, who sits in darkness and sings to cheer its own solitude with sweet sounds; his auditors are as men entranced by the melody of an unseen musician, who feel that they are moved and softened, yet know not whence or why. The poems of Homer and his contemporaries were the delight of infant Greece; they were the elements of that social system which is the column upon which all succeeding civilization has reposed. Homer embodied the ideal perfection of his age in human character; nor can we doubt that those who read his verses were awakened to an ambition of becoming like to Achilles, Hector, and Ulysses: the truth and beauty of friendship, patriotism, and persevering devotion to an object, were unveiled to the depths in these immortal creations: the sentiments of the auditors must have been refined and enlarged by a sympathy with such great and lovely impersonations, until from admiring they imitated, and from imitation they identified themselves with the objects of their admiration. Nor let it be objected, that these characters are remote from moral perfection, and that they are by no means to be considered as edifying patterns for general imitation. Every epoch, under names more or less specious, has deified its peculiar errors; revenge is the naked idol of the worship of a semibarbarous age; and self-deceit is the veiled image of unknown evil, before which luxury and satiety lie prostrate. But a poet considers the vices of his contemporaries as a temporary dress in which his creations must be arrayed, and which cover without concealing the eternal proportions of their beauty. An epic or dramatic personage is understood to wear them around his soul, as he may the ancient armor or the modern uniform around his body; whilst it is easy to conceive a dress more graceful than either. The beauty of the internal nature cannot be so far concealed by its accidental vesture, but that the spirit of its form shall communicate itself to the very disguise, and indicate the shape it hides from the manner in which it is worn. A majestic form and graceful motions will express themselves through the most barbarous and tasteless costume. Few poets of the highest class have chosen to exhibit the beauty of their conceptions in its naked truth and splendor; and it is doubtful whether the alloy of costume, habit, &c., be not necessary to temper this planetary music for mortal ears.

The whole objection, however, of the immorality of poetry rests upon a misconception of the manner in which poetry acts to produce the moral improvement of man. Ethical science arranges the elements which poetry has created, and propounds schemes and proposes examples of civil and domestic life: nor is it for want of admirable doctrines that men hate, and despise, and censure, and deceive, and subjugate one another. But poetry acts in another and diviner manner. It awakens and enlarges the mind itself by rendering it the receptacle of a thousand unapprehended combinations of thought. Poetry lifts the veil from the hidden beauty of the world, and makes familiar objects be as if they were not familiar; it reproduces all that it represents, and the impersonations clothed in its Elysian light stand thenceforward in the minds of those who have once contemplated them as memorials of that gentle and exalted content which extends itself over all thoughts and actions with which it coexists. The great secret of morals is love; or a going out of our own nature, and an identification of ourselves with the beautiful which exists in thought, action, or person, not our own. A man, to be greatly good, must imagine intensely and comprehensively; he must put himself in the place of another and of many others; the pains and pleasures of his species must become his own. The great instrument of moral good is the imagination; and poetry administers to the effect by acting upon the cause. Poetry enlarges the circumference of the imagination by replenishing it with thoughts of ever new delight, which have the power of attracting and assimilating to their own nature all other thoughts, and which form new intervals and interstices whose void forever craves fresh food. Poetry strengthens the faculty which is the organ of the moral nature of man, in the same manner as exercise strengthens a limb. A poet therefore would do ill to embody his own conceptions of right and wrong, which are usually those of his place and time, in his poetical creations, which participate in neither. By this assumption of the inferior office of interpreting the effect, in which perhaps after all he might acquit himself but imperfectly, he would resign a glory in a participation in the cause. There was little danger that Homer, or any of the eternal poets, should have so far misunderstood themselves as to have abdicated this throne of their widest dominion. Those in whom the poetical faculty, though great, is less intense, as Euripides, Lucan, Tasso, Spenser,[15] have frequently affected a moral aim, and the effect of their poetry is diminished in exact proportion to the degree in which they compel us to advert to this purpose.

[14] Shelley adopts the old Horatian description (above, page 83) that answers Socrates's challenge (above, page 36).

Homer and the cyclic poets were followed at a certain interval by the dramatic and lyrical poets of Athens, who flourished contemporaneously with all that is most perfect in the kindred expressions of the poetical faculty; architecture, painting, music, the dance, sculpture, philosophy, and, we may add, the forms of civil life. For although the scheme of Athenian society was deformed by many imperfections which the poetry existing in chivalry and Christianity has erased from the habits and institutions of modern Europe; yet never at any other period has so much energy, beauty, and virtue, been developed; never was blind strength and stubborn form so disciplined and rendered subject to the will of man, or that will less repugnant to the dictates of the beautiful and the true, as during the century which preceded the death of Socrates.[16] Of no other epoch in the history of our species have we records and fragments stamped so visibly with the image of the divinity in man. But it is poetry alone, in form, in action, and in language, which has rendered this epoch memorable above all others, and the storehouse of examples to everlasting time. For written poetry existed at that epoch simultaneously with the other arts, and it is an idle inquiry to demand which gave and which received the light, which all, as from a common focus, have scattered over the darkest periods of succeeding time. We know no more of cause and effect than a constant conjunction of events: poetry is ever found to coexist with whatever other arts contribute to the happiness and perfection of man. I appeal to what has already been established to distinguish between the cause and the effect.

It was at the period here adverted to, that the drama had its birth; and however a succeeding writer may have equaled or surpassed those few great specimens of the Athenian drama which have been preserved to us, it is indisputable that the art itself never was understood or practiced according to the true philosophy of it, as at Athens. For the Athenians employed language, action, music, painting, the dance, and religious institutions, to produce a common effect in the representation of the highest idealisms of passion and of power; each division in the art was made perfect in its kind by artists of the most consummate skill, and was disciplined into a beautiful proportion and unity one towards the other. On the modern stage a few only of the elements capable of expressing the image of the poet's conception are employed at once. We have tragedy without music and dancing; and music and dancing without the highest impersonations of which they are the fit accompaniment, and both without religion and solemnity. Religious institution has indeed been usually banished from the stage. Our system of divesting the actor's face of a mask, on which the many expressions appropriated to his dramatic character might be molded into one permanent and unchanging expression, is favorable only to a partial and inharmonious effect; it is fit for nothing but a monologue, where all the attention may be directed to some great master of ideal mimicry. The modern practice of blending comedy with tragedy, though liable to great abuse in point of practice, is undoubtedly an extension of the dramatic circle; but the comedy should be as in *King Lear,* universal, ideal, and sublime. It is perhaps the intervention of this principle which determines the balance in favor of *King Lear* against the *Oedipus Tyrannus* or the *Agamemnon*;[17] or, if you will, the trilogies with which they are connected; unless the intense power of the choral poetry, especially that of the latter, should be considered as restoring the equilibrium. *King Lear,* if it can sustain this comparison, may be judged to be the most perfect specimen of the dramatic art existing in the world; in spite of the narrow conditions to which the poet was subjected by the ignorance of the philosophy of the drama which has prevailed in modern Europe. Calderón, in his religious *autos,*[18] has attempted to fulfill some of the high conditions of dramatic representation neglected by Shakespeare; such as the establishing a relation between the drama and religion, and the accommodating them to music and dancing; but he omits the observation of conditions still more important, and more is lost than gained by the substitution of the rigidly defined and ever-repeated idealisms of a distorted superstition for the living impersonations of the truth of human passion.

[15] Euripides (485–406 B.C.), Greek tragic dramatist; Marcus Annaeus Lucanus (39–65), Latin poet; Tasso (above, page 226); Edmund Spenser (1552?–1599), English poet.

[16] Socrates was forced to commit suicide in 399 B.C.

But I digress. The connection of scenic exhibitions with the improvement or corruption of the manners of men, has been universally recognized: in other words, the presence or absence of poetry in its most perfect and universal form, has been found to be connected with good and evil in conduct or habit. The corruption which has been imputed to the drama as an effect, begins, when the poetry employed in its constitution ends: I appeal to the history of manners whether the periods of the growth of the one and the decline of the other have not corresponded with an exactness equal to any example of moral cause and effect.

The drama at Athens, or wheresoever else it may have approached to its perfection, ever coexisted with the moral and intellectual greatness of the age. The tragedies of the Athenian poets are as mirrors in which the spectator beholds himself, under a thin disguise of circumstance, stripped of all but that ideal perfection and energy which everyone feels to be the internal type of all that he loves, admires, and would become. The imagination is enlarged by a sympathy with pains and passions so mighty, that they distend in their conception the capacity of that by which they are conceived; the good affections are strengthened by pity, indignation, terror, and sorrow; and an exalted calm is prolonged from the satiety of this high exercise of them into the tumult of familiar life: even crime is disarmed of half its horror and all its contagion by being represented as the fatal consequence of the unfathomable agencies of nature; error is thus divested of its willfulness; men can no longer cherish it as the creation of their choice. In a drama of the highest order there is little food for censure or hatred; it teaches rather self-knowledge and self-respect. Neither the eye nor the mind can see itself, unless reflected upon that which it resembles. The drama, so long as it continues to express poetry, is as a prismatic and many-sided mirror, which collects the brightest rays of human nature and divides and reproduces them from the simplicity of their elementary forms, and touches them with majesty and beauty, and multiplies all that it reflects, and endows it with the power of propagating its like wherever it may fall.

But in periods of the decay of social life, the drama sympathizes with that decay. Tragedy becomes a cold imitation of the forms of the great masterpieces of antiquity, divested of all harmonious accompaniment of the kindred arts; and often the very form misunderstood, or a weak attempt to teach certain doctrines, which the writer considers as moral truths; and which are usually no more than specious flatteries of some gross vice or weakness, with which the author, in common with his auditors, are infected. Hence what has been called the classical and domestic drama. Addison's *Cato*[19] is a specimen of the one; and would it were not superfluous to cite examples of the other! To such purposes poetry cannot be made subservient. Poetry is a sword of lightning, ever unsheathed, which consumes the scabbard that would contain it. And thus we observe that all dramatic writings of this nature are unimaginative in a singular degree; they affect sentiment and passion, which, divested of imagination, are other names for caprice and appetite. The period in our own history of the grossest degradation of the drama is the reign of Charles II,[20] when all forms in which poetry had been accustomed to be expressed became hymns to the triumph of kingly power over liberty and virtue. Milton[21] stood alone illuminating an age unworthy of him. At such periods the calculating principle pervades all the forms of dramatic exhibition, and poetry ceases to be expressed upon them. Comedy loses its ideal universality: wit succeeds to humor; we laugh from self-complacency and triumph, instead of pleasure; malignity, sarcasm, and contempt, succeed to sympathetic merriment; we hardly laugh, but we smile. Obscenity, which is ever blasphemy against the divine beauty in life, becomes, from a very veil which it assumes, more active if less disgusting: it is a monster for which the corruption of society forever brings forth new food, which it devours in secret.

[20] Charles II of England reigned from 1660 to 1685, known as the Restoration period.

[21] John Milton (1608–1674), English poet.

The drama being that form under which a greater number of modes of expression of poetry are susceptible of being combined than any other, the connection of poetry and social good is more observable in the drama than in whatever other form. And it is indisputable that the highest perfection of human society has ever corresponded with the highest dramatic excellence; and that the corruption or the extinction of the drama in a nation where it has once flourished, is a mark of a corruption of manners, and an extinction of the energies which sustain the soul of social life. But, as Machiavelli[22] says of political institutions, that life may be preserved and renewed, if men should arise capable of bringing back the drama to its principles. And this is true with respect to poetry in its most extended sense: all language, institution and form, require not only to be produced but to be sustained: the office and character of a poet participates in the divine nature as regards providence, no less than as regards creation.

Civil war, the spoils of Asia, and the fatal predominance first of the Macedonian, and then of the Roman arms, were so many symbols of the extinction or suspension of the creative faculty in Greece. The bucolic writers, who found patronage under the lettered tyrants of Sicily and Egypt, were the latest representatives of its most glorious reign. Their poetry is intensely melodious; like the odor of the tuberose, it overcomes and sickens the spirit with excess of sweetness; whilst the poetry of the preceding age was as a meadow-gale of June, which mingles the fragrance of all the flowers of the field, and adds a quickening and harmonizing spirit of its own, which endows the sense with a power of sustaining its extreme delight. The bucolic and erotic delicacy in written poetry is correlative with that softness in statuary, music, and the kindred arts, and even in manners and institutions, which distinguished the epoch to which I now refer. Nor is it the poetical faculty itself, or any misapplication of it, to which this want of harmony is to be imputed. An equal sensibility to the influence of the senses and the affections is to be found in the writings of Homer and Sophocles: the former, especially, has clothed sensual and pathetic images with irresistible attractions. Their superiority over these succeeding writers consists in the presence of those thoughts which belong to the inner faculties of our nature, not in the absence of those which are connected with the external: their incomparable perfection consists in a harmony of the union of all. It is not what the erotic poets have, but what they have not, in which their imperfection consists. It is not inasmuch as they were poets, but inasmuch as they were not poets, that they can be considered with any plausibility as connected with the corruption of their age. Had that corruption availed so as to extinguish in them the sensibility to pleasure, passion, and natural scenery, which is imputed to them as an imperfection, the last triumph of evil would have been achieved. For the end of social corruption is to destroy all sensibility to pleasure; and therefore it is corruption. It begins at the imagination and the intellect as at the core, and distributes itself thence as a paralyzing venom, through the affections into the very appetites, until all become a torpid mass in which hardly sense survives. At the approach of such a period, poetry ever addresses itself to those faculties which are the last to be destroyed, and its voice is heard, like the footsteps of Astraea,[23] departing from the world. Poetry ever communicates all the pleasure which men are capable of receiving: it is ever still the light of life; the source of whatever of beautiful or generous or true can have place in an evil time. It will readily be confessed that those among the luxurious citizens of Syracuse and Alexandria, who were delighted with the poems of Theocritus,[24] were less cold, cruel, and sensual than the remnant of their tribe. But corruption must utterly have destroyed the fabric of human society before poetry can ever cease. The sacred links of that chain have never been entirely disjoined, which descending through the minds of many men is attached to those great minds, whence as from a magnet the invisible effluence is sent forth, which at once connects, animates, and sustains the life of all. It is the faculty which contains within itself the seeds at once of its own and of social renovation. And let us not circumscribe the effects of the bucolic and erotic poetry within the limits of the sensibility of those to whom it was addressed. They may have perceived the beauty of those immortal compositions, simply as fragments and isolated portions: those who are more finely organized, or born in a happier age, may recognize them as episodes to that great poem, which all poets, like the cooperating thoughts of one great mind, have built up since the beginning of the world.

[22] Niccolò Machiavelli (1469–1527), Italian political philosopher.

[23] Goddess of Justice, who fled earth in the age of brass.

[24] Theocritus (fl. c. 270 B.C.), Greek pastoral poet.

The same revolutions within a narrower sphere had place in ancient Rome; but the actions and forms of its social life never seem to have been perfectly saturated with the poetical element. The Romans appear to have considered the Greeks as the selectest treasuries of the selectest forms of manners and of nature, and to have abstained from creating in measured language, sculpture, music, or architecture, anything which might bear a particular relation to their own condition, whilst it should bear a general one to the universal constitution of the world. But we judge from partial evidence, and we judge perhaps partially. Ennius, Varro, Pacuvius, and Accius,[25] all great poets, have been lost. Lucretius is in the highest, and Virgil in a very high sense, a creator.[26] The chosen delicacy of expressions of the latter, are as a mist of light which conceal from us the intense and exceeding truth of his conceptions of nature. Livy is instinct with poetry. Yet Horace, Catullus, Ovid, and generally the other great writers of the Virgilian age, saw man and nature in the mirror of Greece.[27] The institutions also, and the religion, of Rome were less poetical than those of Greece, as the shadow is less vivid than the substance. Hence poetry in Rome, seemed to follow, rather than accompany, the perfection of political and domestic society. The true poetry of Rome lived in its institutions; for whatever of beautiful, true, and majestic, they contained, could have sprung only from the faculty which creates the order in which they consist. The life of Camillus, the death of Regulus; the expectation of the senators, in their godlike state, of the victorious Gauls; the refusal of the republic to make peace with Hannibal, after the battle of Cannae, were not the consequences of a refined calculation of the probable personal advantage to result from such a rhythm and order in the shows of life, to those who were at once the poets and the actors of these immortal dramas. The imagination beholding the beauty of this order, created it out of itself according to its own idea; the consequence was empire, and the reward everlasting fame. These things are not the less poetry, *"quia carent vate sacro."*[28] They are the episodes of that cyclic poem written by time upon the memories of men. The past, like an inspired rhapsodist, fills the theatre of everlasting generations with their harmony.

At length the ancient system of religion and manners had fulfilled the circle of its evolutions. And the world would have fallen into utter anarchy and darkness, but that there were found poets among the authors of the Christian and chivalric systems of manners and religion, who created forms of opinion and action never before conceived; which, copied into the imaginations of men, become as generals to the bewildered armies of their thoughts. It is foreign to the present purpose to touch upon the evil produced by these systems: except that we protest, on the ground of the principles already established, that no portion of it can be attributed to the poetry they contain.

It is probable that the poetry of Moses, Job, David, Solomon, and Isaiah, had produced a great effect upon the mind of Jesus and his disciples. The scattered fragments preserved to us by the biographers of this extraordinary person, are all instinct with the most vivid poetry. But his doctrines seem to have been quickly distorted. At a certain period after the prevalence of a system of opinions founded upon those promulgated by him, the three forms into which Plato had distributed the faculties of mind underwent a sort of apotheosis, and became the object of the worship of the civilized world. Here it is to be confessed that "Light seems to thicken," and

> The crow makes wing to the rooky wood,
> Good things of day begin to droop and drowse,
> And night's black agents to their preys do rouse.[29]

But mark how beautiful an order has sprung from the dust and blood of this fierce chaos! How the world, as from a resurrection, balancing itself on the golden wings of knowledge and of hope, has reassumed its yet unwearied flight into the heaven of time. Listen to the music, unheard by outward ears, which is as a ceaseless and invisible wind, nourishing its everlasting course with strength and swiftness.

The poetry in the doctrines of Jesus Christ, and the mythology and institutions of the Celtic[30] conquerors of the Roman Empire, outlived the darkness and the convulsions connected with their growth and victory, and blended themselves in a new fabric of manners and opinion. It is an error to impute the ignorance of the Dark Ages to the Christian doctrines or the predominance of the Celtic nations. Whatever of evil their agencies may have contained sprang from the extinction of the poetical principle, connected with the progress of despotism and superstition. Men, from causes too intricate to be here discussed, had become insensible and selfish: their own will had become feeble, and yet they were its slaves, and thence the slaves of the will of others: lust, fear, avarice, cruelty, and fraud, characterized a race amongst whom no one was to be found capable of *creating* in form, language, or institution. The moral anomalies of such a state of society are not justly to be charged upon any class of events immediately connected with them, and those events are most entitled to our approbation which could dissolve it most expeditiously. It is unfortunate for those who cannot distinguish words from thoughts, that many of these anomalies have been incorporated into our popular religion.

[29] Shakespeare, *Macbeth* III, ii, 50–53.

[30] Shelley must mean Germanic.

It was not until the eleventh century that the effects of the poetry of the Christian and chivalric systems began to manifest themselves. The principle of equality had been discovered and applied by Plato in his *Republic,* as the theoretical rule of the mode in which the materials of pleasure and of power produced by the common skill and labor of human beings, ought to be distributed among them. The limitations of this rule were asserted by him to be determined only by the sensibility of each, or the utility to result to all. Plato, following the doctrines of Timaeus and Pythagoras,[31] taught also a moral and intellectual system of doctrine, comprehending at once the past, the present, and the future condition of man. Jesus Christ divulged the sacred and eternal truths contained in these views to mankind, and Christianity, in its abstract purity, became the exoteric expression of the esoteric doctrines of the poetry and wisdom of antiquity. The incorporation of the Celtic nations with the exhausted population of the south, impressed upon it the figure of the poetry existing in their mythology and institutions. The result was a sum of the action and reaction of all the causes included in it; for it may be assumed as a maxim that no nation or religion can supersede any other without incorporating into itself a portion of that which it supersedes. The abolition of personal and domestic slavery, and the emancipation of women from a great part of the degrading restraints of antiquity, were among the consequences of these events.

The abolition of personal slavery is the basis of the highest political hope that it can enter into the mind of man to conceive. The freedom of women produced the poetry of sexual love. Love became a religion, the idols of whose worship were ever present. It was as if the statues of Apollo and the Muses had been endowed with life and motion, and had walked forth among their worshippers; so that earth became peopled by the inhabitants of a diviner world. The familiar appearance and proceedings of life became wonderful and heavenly, and a paradise was created as out of the wrecks of Eden. And as this creation itself is poetry, so its creators were poets; and language was the instrument of their art: *"Galeotto fù il libro, e chi lo scrisse."*[32] The Provençal trouveurs, or inventors, preceded Petrarch,[33] whose verses are as spells, which unseal the inmost enchanted fountains of the delight which is in the grief of love. It is impossible to feel them without becoming a portion of that beauty which we contemplate: it were superfluous to explain how the gentleness and the elevation of mind connected with these sacred emotions can render men more amiable, more generous and wise, and lift them out of the dull vapors of the little world of self. Dante understood the secret things of love even more than Petrarch. His *Vita Nuova* is an inexhaustible fountain of purity of sentiment and language: it is the idealized history of that period, and those intervals of his life which were dedicated to love. His apotheosis of Beatrice in Paradise, and the gradations of his own love and her loveliness, by which as by steps he feigns himself to have ascended to the throne of the Supreme Cause, is the most glorious imagination of modern poetry. The acutest critics have justly reversed the judgment of the vulgar, and the order of the great acts of the *Divina Commedia,* in the measure of the admiration which they accord to the "Hell," "Purgatory," and "Paradise." The latter is a perpetual hymn of everlasting love. Love, which found a worthy poet in Plato alone of all the ancients, has been celebrated by a chorus of the greatest writers of the renovated world; and the music has penetrated the caverns of society, and its echoes still drown the dissonance of arms and superstition. At successive intervals, Ariosto, Tasso, Shakespeare, Spenser, Calderon, Rousseau,[34] and the great writers of our own age, have celebrated the dominion of love, planting as it were trophies in the human mind of that sublimest victory over sensuality and force. The true relation borne to each other by the sexes into which humankind is distributed, has become less misunderstood; and if the error which confounded diversity with inequality of the powers of the two sexes has been partially recognized in the opinions and institutions of modern Europe, we owe this great benefit to the worship of which chivalry was the law, and poets the prophets.

The poetry of Dante may be considered as the bridge thrown over the stream of time, which unites the modern and ancient world. The distorted notions of invisible things which Dante and his rival Milton have idealized, are merely the mask and the mantle in which these great poets walk through eternity enveloped and disguised. It is a difficult question to determine how far they were conscious of the distinction which must have subsisted in their minds between their own creeds and that of the people. Dante at least appears to wish to mark the full extent of it by placing Riphaeus, whom Virgil calls *"justissimus unus,"*[35] in Paradise, and observing a most heretical caprice in his distribution of rewards and punishments.[36] And Milton's poem contains within itself a philosophical refutation of that system, of which, by a strange and natural antithesis, it has been a chief popular support. Nothing can exceed the energy and magnificence of the character of Satan as expressed in *Paradise Lost.* It is a mistake to suppose that he could ever have been intended for the popular personification of evil. Implacable hate, patient cunning, and a sleepless refinement of device to inflict the extremest anguish on an enemy, these things are evil; and, although venial in a slave, are not to be forgiven in a tyrant; although redeemed by much that ennobles his defeat in one subdued, are marked by all that dishonors his conquest in the victor. Milton's Devil as a moral being is as far superior to his God, as one who perseveres in some purpose which he has conceived to be excellent in spite of adversity and torture, is to one who in the cold security of undoubted triumph inflicts the most horrible revenge upon his enemy, not from any mistaken notion of inducing him to repent of a perseverance in enmity, but with the alleged design of exasperating him to deserve new torments. Milton has so far violated the popular creed (if this shall be judged to be a violation) as to have alleged no superiority of moral virtue to his god over his devil.[37] And this bold neglect of a direct moral purpose is the most decisive proof of the supremacy of Milton's genius. He mingled as it were the elements of human nature as colors upon a single pallet, and arranged them in the composition of his great picture according to the laws of epic truth; that is, according to the laws of that principle by which a series of actions of the external universe and of intelligent and ethical beings is calculated to excite the sympathy of succeeding generations of mankind. The *Divina Commedia* and *Paradise Lost* have conferred upon modern mythology a systematic form: and when change and time shall have added one more superstition to the mass of those which have arisen and decayed upon the earth, commentators will be learnedly employed in elucidating the religion of ancestral Europe, only not utterly forgotten because it will have been stamped with the eternity of genius.

---

[31] Plato (above, page 8); Timaeus (fl. 400? B.C.), Greek philosopher; Pythagoras (c. 582–c. 507 B.C.), Greek philosopher.

[32] "Galleot was the book, and he who wrote it." Dante, *The Divine Comedy,* "Inferno" V, 137.

[33] Francesco Petrarca (1304–1374), Italian poet.

[34] Ludovico Ariosto (1474–1533), Italian poet; Tasso (above, page 226); Jean Jacques Rousseau (1712–1778), French philosopher.

Homer was the first and Dante the second epic poet: that is, the second poet, the series of whose creations bore a defined and intelligible relation to the knowledge and sentiment and religion of the age in which he lived, and of the ages which followed it: developing itself in correspondence with their development. For Lucretius had limed the wings of his swift spirit in the dregs of the sensible world; and Virgil, with a modesty that ill became his genius, had affected the fame of an imitator, even whilst he created anew all that he copied; and none among the flock of mock birds, though their notes were sweet, Apollonius Rhodius, Quintus Calaber Smyrnaeus, Nonnus, Lucan, Statius, or Claudian,[38] have sought even to fulfill a single condition of epic truth. Milton was the third epic poet. For if the title of epic in its highest sense be refused to the *Aeneid,* still less can it be conceded to the *Orlando Furioso,* the *Gerusalemme Liberata,* the *Lusiad,* or the *Faerie Queene.*[39]

Dante and Milton were both deeply penetrated with the ancient religion of the civilized world; and its spirit exists in their poetry probably in the same proportion as its forms survived in the unreformed worship of modern Europe. The one preceded and the other followed the Reformation at almost equal intervals. Dante was the first religious reformer, and Luther[40] surpassed him rather in the rudeness and acrimony, than in the boldness of his censures of papal usurpation. Dante was the first awakener of entranced Europe; he created a language, in itself music and persuasion, out of a chaos of inharmonious barbarisms. He was the congregator of those great spirits who presided over the resurrection of learning; the Lucifer of that starry flock which in the thirteenth century shone forth from republican Italy, as from a heaven, into the darkness of the benighted world. His very words are instinct with spirit; each is as a spark, a burning atom of inextinguishable thought; and many yet lie covered in the ashes of their birth, and pregnant with a lightning which has yet found no conductor. All high poetry is infinite; it is as the first acorn, which contained all oaks potentially. Veil after veil may be undrawn, and the inmost naked beauty of the meaning never exposed. A great poem is a fountain forever overflowing with the waters of wisdom and delight; and after one person and one age has exhausted all its divine effluence which their peculiar relations enable them to share, another and yet another succeeds, and new relations are ever developed, the source of an unforseen and an unconceived delight.

[35] "The most just one." *Aeneid* II, 426–27.

[36] Riphaeus was a pagan, but Dante put him in Paradise.

[37] Shelley's is the most radical and notorious Romantic reading of Milton's Satan as a heroic figure.

[38] Apollonius Rhodius (fl. third century B.C.), Alexandrian and Rhodian epic poet; Quintus Calabar Smyrnaeus (fourth century A.D.), Greek epic poet; Nonnus (fifth century), Greek poet; Publius Papinius Statius (c. 40–c. 96), Latin poet; Claudius Claudianus (d. 408), Latin poet.

[39] By Virgil, Ariosto, Tasso, Camoens, and Spenser, respectively.

[40] Martin Luther (1481–1546), German Protestant Reformation leader.

The age immediately succeeding to that of Dante, Petrarch, and Boccaccio,[41] was characterized by a revival of painting, sculpture, and architecture. Chaucer caught the sacred inspiration, and the superstructure of English literature is based upon the materials of Italian invention.

But let us not be betrayed from a defense into a critical history of poetry and its influence on society. Be it enough to have pointed out the effects of poets, in the large and true sense of the word, upon their own and all succeeding times.

But poets have been challenged to resign the civic crown of reasoners and mechanists, on another plea. It is admitted that the exercise of the imagination is most delightful, but it is alleged that that of reason is more useful. Let us examine, as the grounds of this distinction, what is here meant by utility. Pleasure or good, in a general sense, is that which the consciousness of a sensitive and intelligent being seeks, and in which, when found, it acquiesces. There are two kinds of pleasure, one durable, universal and permanent; the other transitory and particular. Utility may either express the means of producing the former or the latter. In the former sense, whatever strengthens and purifies the affections, enlarges the imagination, and adds spirit to sense, is useful. But a narrower meaning may be assigned to the word utility, confining it to express that which banishes the importunity of the wants of our animal nature, the surrounding men with security of life, the dispersing the grosser delusions of superstition, and the conciliating such a degree of mutual forbearance among men as may consist with the motives of personal advantage.

Undoubtedly the promoters of utility, in this limited sense, have their appointed office in society. They follow the footsteps of poets, and copy the sketches of their creations into the book of common life. They make space, and give time. Their exertions are of the highest value, so long as they confine their administration of the concerns of the inferior powers of our nature within the limits due to the superior ones. But whilst the skeptic destroys gross superstitions, let him spare to deface, as some of the French writers have defaced, the eternal truths charactered upon the imaginations of men. Whilst the mechanist abridges, and the political economist combines labor, let them beware that their speculations, for want of correspondence with those first principles which belong to the imagination, do not tend, as they have in modern England, to exasperate at once the extremes of luxury and of want. They have exemplified the saying, "To him that hath, more shall be given; and from him that hath not, the little that he hath shall be taken away." The rich have become richer, and the poor have become poorer; and the vessel of the state is driven between the Scylla and Charybdis of anarchy and despotism. Such are the effects which must ever flow from an unmitigated exercise of the calculating faculty.

It is difficult to define pleasure in its highest sense; the definition involving a number of apparent paradoxes. For, from an inexplicable defect of harmony in the constitution of human nature, the pain of the inferior is frequently connected with the pleasures of the superior portions of our being. Sorrow, terror, anguish, despair itself, are often the chosen expressions of an approximation to the highest good. Our sympathy in tragic fiction depends on this principle; tragedy delights by affording a shadow of the pleasure which exists in pain. This is the source also of the melancholy which is inseparable from the sweetest melody. The pleasure that is in sorrow is sweeter than the pleasure of pleasure itself. And hence the saying, "It is better to go to the house of mourning, than to the house of mirth."[42] Not that this highest species of pleasure is necessarily linked with pain. The delight of love and friendship, the ecstasy of the admiration of nature, the joy of the perception and still more of the creation of poetry, is often wholly unalloyed.

The production and assurance of pleasure in this highest sense is true utility. Those who produce and preserve this pleasure are poets or poetical philosophers.

The exertions of Locke, Hume, Gibbon, Voltaire, Rousseau,[43] and their disciples, in favor of oppressed and deluded humanity, are entitled to the gratitude of mankind. Yet it is easy to calculate the degree of moral and intellectual improvement which the world would have exhibited, had they never lived. A little more nonsense would have been talked for a century or two; and perhaps a few more men, women, and children, burn as heretics. We might not at this moment have been congratulating each other on the abolition of the Inquisition in Spain. But it exceeds all imagination to conceive what would have been the moral condition of the world if neither Dante, Petrarch, Boccaccio, Chaucer, Shakespeare, Calderon, Lord Bacon, nor Milton, had ever existed; if Raphael and Michelangelo[44] had never been born; if the Hebrew poetry had never been translated; if a revival of the study of Greek literature had never taken place; if no monuments of ancient sculpture had been handed down to us; and if the poetry of the religion of the ancient world had been extinguished together with its belief.

[41] Boccaccio (above, page 157).

[42] Suggests Eccles. 7.2.

[43] Locke (above, page 281); Hume (above, page 322); Edward Gibbon (1737–1794), English historian; Francois Marie Arouet de Voltaire (1694–1778), French philosopher.

[44] Geoffrey Chaucer (c. 1340–1400), English poet; Raphael Santi (1483–1520) and Michelangelo Buonarroti (1475–1564), Italian painters.

The human mind could never, except by the intervention of these excitements, have been awakened to the invention of the grosser sciences, and that application of analytical reasoning to the aberrations of society, which it is now attempted to exalt over the direct expression of the inventive and creative faculty itself.

We have more moral, political and historical wisdom, than we know how to reduce into practice; we have more scientific and economical knowledge than can be accommodated to the just distribution of the produce which it multiplies. The poetry in these systems of thought, is concealed by the accumulation of facts and calculating processes. There is no want of knowledge respecting what is wisest and best in morals, government, and political economy, or at least what is wiser and better than what men now practice and endure. But we let "*I dare not* wait upon *I would,* like the poor cat in the adage."[45] We want the creative faculty to imagine that which we know; we want the generous impulse to act that which we imagine; we want the poetry of life: our calculations have outrun conception; we have eaten more than we can digest. The cultivation of those sciences which have enlarged the limits of the empire of man over the external world, has, for want of the poetical faculty, proportionally circumscribed those of the internal world; and man, having enslaved the elements, remains himself a slave. To what but a cultivation of the mechanical arts in a degree disproportioned to the presence of the creative faculty, which is the basis of all knowledge, is to be attributed the abuse of all invention for abridging and combining labor, to the exasperation of the inequality of mankind? From what other cause has it arisen that the discoveries which should have lightened, have added a weight to the curse imposed on Adam? Poetry and the principle of self of which money is the visible incarnation, are the God and Mammon of the world.

The functions of the poetical faculty are twofold; by one it creates new materials of knowledge and power and pleasure; by the other it engenders in the mind a desire to reproduce and arrange them according to a certain rhythm and order which may be called the beautiful and the good. The cultivation of poetry is never more to be desired than at periods when, from an excess of the selfish and calculating principle, the accumulation of the materials of external life exceed the quantity of the power of assimilating them to the internal laws of human nature. The body has then become too unwieldy for that which animates it.

Poetry is indeed something divine. It is at once the center and circumference of knowledge; it is that which comprehends all science, and that to which all science must be referred. It is at the same time the root and blossom of all other systems of thought; it is that from which all spring, and that which adorns all; and that which, if blighted, denies the fruit and the seed, and withholds from the barren world the nourishment and the succession of the scions of the tree of life. It is the perfect and consummate surface and bloom of all things; it is as the odor and the color of the rose to the texture of the elements which compose it, as the form and splendor of unfaded beauty to the secrets of anatomy and corruption. What were virtue, love, patriotism, friendship—what were the scenery of this beautiful universe which we inhabit; what were our consolations on this side of the grave—and what were our aspirations beyond it, if poetry did not ascend to bring light and fire from those eternal regions where the owl-winged faculty of calculation dare not ever soar? Poetry is not like reasoning, a power to be exerted according to the determination of the will. A man cannot say, "I will compose poetry." The greatest poet even cannot say it; for the mind in creation is as a fading coal, which some invisible influence, like an inconstant wind, awakens to transitory brightness; this power arises from within, like the color of a flower which fades and changes as it is developed, and the conscious portions of our natures are unprophetic either of its approach or its departure. Could this influence be durable in its original purity and force, it is impossible to predict the greatness of the results; but when composition begins, inspiration is already on the decline, and the most glorious poetry that has ever been communicated to the world is probably a feeble shadow of the original conceptions of the poet.[46] I appeal to the greatest poets of the present day, whether it is not an error to assert that the finest passages of poetry are produced by labor and study. The toil and the delay recommended by critics, can be justly interpreted to mean no more than a careful observation of the inspired moments, and an artificial connection of the spaces between their suggestions, by the intertexture of conventional expressions; a necessity only imposed by the limitedness of the poetical faculty itself; for Milton conceived the *Paradise Lost* as a whole before he executed it in portions. We have his own authority also for the Muse having "dictated" to him the "unpremeditated song."[47] And let this be an answer to those who would allege the fifty-six various readings of the first line of the *Orlando Furioso.*[48] Compositions so produced are to poetry what mosaic is to painting. This instinct and intuition of the poetical faculty is still more observable in the plastic and pictorial arts; a great statue or picture grows under the power of the artist as a child in the mother's womb; and the very mind which directs the hands in formation is incapable of accounting to itself for the origin, the gradations, or the media of the process.

[46] For Shelley, in contrast to Blake (above, page 448), the conception is not in the execution but prior to its always lesser approximation.

[47] *Paradise Lost* IX, 23–24.

[48] By Ariosto.

Poetry is the record of the best and happiest moments of the happiest and best minds. We are aware of evanescent visitations of thought and feeling, sometimes associated with place or person, sometimes regarding our own mind alone, and always arising unforeseen and departing unbidden, but elevating and delightful beyond all expression: so that even in the desire and regret they leave, there cannot but be pleasure, participating as it does in the nature of its object. It is as it were the interpenetration of a diviner nature through our own; but its footsteps are like those of a wind over the sea, which the morning calm erases, and whose traces remain only, as on the wrinkled sand which paves it. These and corresponding conditions of being are experienced principally by those of the most delicate sensibility and the most enlarged imagination; and the state of mind produced by them is at war with every base desire. The enthusiasm of virtue, love, patriotism, and friendship, is essentially linked with such emotions; and whilst they last, self appears as what it is, an atom to a universe. Poets are not only subject to these experiences as spirits of the most refined organization, but they can color all that they combine with the evanescent hues of this ethereal world; a word, a trait in the representation of a scene or a passion, will touch the enchanted chord, and reanimate, in those who have ever experienced these emotions, the sleeping, the cold, the buried image of the past. Poetry thus makes immortal all that is best and most beautiful in the world; it arrests the vanishing apparitions which haunt the interlunations of life, and veiling them, or in language or in form, sends them forth among mankind, bearing sweet news of kindred joy to those with whom their sisters abide—abide, because there is no portal of expression from the caverns of the spirit which they inhabit into the universe of things. Poetry redeems from decay the visitations of the divinity in man.

Poetry turns all things to loveliness; it exalts the beauty of that which is most beautiful, and it adds beauty to that which is most deformed; it marries exultation and horror, grief and pleasure, eternity and change; it subdues to union under its light yoke, all irreconcilable things. It transmutes all that it touches, and every form moving within the radiance of its presence is changed by wondrous sympathy to an incarnation of the spirit which it breathes: its secret alchemy turns to potable gold the poisonous waters which flow from death through life; it strips the evil of familiarity from the world, and lays bare the naked and sleeping beauty, which is the spirit of its forms.

All things exist as they are perceived; at least in relation to the percipient. "The mind is its own place, and of itself can make a heaven of hell, a hell of heaven."[49] But poetry defeats the curse which binds us to be subjected to the accident of surrounding impressions. And whether it spreads its own figured curtain, or withdraws life's dark veil from before the scene of things, it equally creates for us a being within our being. It makes us the inhabitants of a world to which the familiar world is a chaos. It reproduces the common universe of which we are portions and percipients, and it purges from our inward sight the film of familiarity which obscures from us the wonder of our being. It compels us to feel that which we perceive, and to imagine that which we know. It creates anew the universe, after it has been annihilated in our minds by the recurrence of impressions blunted by reiteration. It justifies the bold and true words of Tasso: *"Non merita nome di creatore, se non Iddio ed il poeta."*[50]

A poet, as he is the author to others of the highest wisdom, pleasure, virtue and glory, so he ought personally to be the happiest, the best, the wisest, and the most illustrious of men. As to his glory, let time be challenged to declare whether the fame of any other institutor of human life be comparable to that of a poet. That he is the wisest, the happiest, and the best, inasmuch as he is a poet, is equally incontrovertible: the greatest poets have been men of the most spotless virtue, of the most consummate prudence, and, if we would look into the interior of their lives, the most fortunate of men: and the exceptions, as they regard those who possessed the poetic faculty in a high yet inferior degree, will be found on consideration to confine rather than destroy the rule. Let us for a moment stoop to the arbitration of popular breath, and usurping and uniting in our own persons the incompatible characters of accuser, witness, judge, and executioner, let us decide without trial, testimony, or form, that certain motives of those who are "there sitting where we dare not soar,"[51] are reprehensible. Let us assume that Homer was a drunkard, that Virgil was a flatterer, that Horace was a coward, that Tasso was a madman, that Lord Bacon was a peculator, that Raphael was a libertine, that Spenser was a poet laureate. It is inconsistent with this division of our subject to cite living poets, but posterity has done ample justice to the great names now referred to. Their errors have been weighed and found to have been dust in the balance; if their sins "were as scarlet, they are now white as snow":[52] they have been washed in the blood of the mediator and redeemer, time. Observe in what a ludicrous chaos the imputations of real or fictitious crime have been confused in the contemporary calumnies against poetry and poets; consider how little is as it appears—or appears, as it is; look to your own motives, and judge not, lest ye be judged.

[49] *Paradise Lost* I, 254–55.

[50] "No one deserves the name of creator except God and the poet." *Discourses on the Heroic Poem,* but misquoted.

[51] *Paradise Lost* IV, 829.

Poetry, as has been said, differs in this respect from logic, that it is not subject to the control of the active powers of the mind, and that its birth and recurrence have no necessary connection with the consciousness or will. It is presumptuous to determine that these are the necessary conditions of all mental causation, when mental effects are experienced insusceptible of being referred to them. The frequent recurrence of the poetical power, it is obvious to suppose, may produce in the mind a habit of order and harmony correlative with its own nature and with its effects upon other minds. But in the intervals of inspiration, and they may be frequent without being durable, a poet becomes a man, and is abandoned to the sudden reflex of the influences under which others habitually live. But as he is more delicately organized than other men, and sensible to pain and pleasure, both his own and that of others, in a degree unknown to them, he will avoid the one and pursue the other with an ardor proportioned to this difference. And he renders himself obnoxious to calumny, when he neglects to observe the circumstances under which these objects of universal pursuit and flight have disguised themselves in one another's garments.

But there is nothing necessarily evil in this error, and thus cruelty, envy, revenge, avarice, and the passions purely evil, have never formed any portion of the popular imputations on the lives of poets.

I have thought it most favorable to the cause of truth to set down these remarks according to the order in which they were suggested to my mind, by a consideration of the subject itself, instead of observing the formality of a polemical reply; but if the view which they contain be just, they will be found to involve a refutation of the arguers against poetry, so far at least as regards the first division of the subject. I can readily conjecture what should have moved the gall of some learned and intelligent writers who quarrel with certain versifiers; I, like them, confess myself unwilling to be stunned by the Theseids of the hoarse Codri of the day. Bavius and Maevius[53] undoubtedly are, as they ever were, insufferable persons. But it belongs to a philosophical critic to distinguish rather than confound.

The first part of these remarks has related to poetry in its elements and principles; and it has been shown, as well as the narrow limits assigned them would permit, that what is called poetry in a restricted sense, has a common source with all other forms of order and of beauty, according to which the materials of human life are susceptible of being arranged, and which is poetry in a universal sense.

The second part[54] will have for its object an application of these principles to the present state of the cultivation of poetry, and a defense of the attempt to idealize the modern forms of manners and opinions, and compel them into a subordination to the imaginative and creative faculty. For the literature of England, an energetic development of which has ever preceded or accompanied a great and free development of the national will, has arisen as it were from a new birth. In spite of the low-thoughted envy which would undervalue contemporary merit, our own will be a memorable age in intellectual achievements, and we live among such philosophers and poets as surpass beyond comparison any who have appeared since the last national struggle for civil and religious liberty. The most unfailing herald, companion, and follower of the awakening of a great people to work a beneficial change in opinion or institution, is poetry. At such periods there is an accumulation of the power of communicating and receiving intense and impassioned conceptions respecting man and nature. The persons in whom this power resides may often, as far as regards many portions of their nature, have little apparent correspondence with that spirit of good of which they are the ministers. But even whilst they deny and abjure they are yet compelled to serve, the power which is seated on the throne of their own soul. It is impossible to read the compositions of the most celebrated writers of the present day without being startled with the electric life which burns within their words. They measure the circumference and sound the depths of human nature with a comprehensive and all-penetrating spirit, and they are themselves perhaps the most sincerely astonished at its manifestations; for it is less their spirit than the spirit of the age. Poets are the hierophants of an unapprehended inspiration; the mirrors of the gigantic shadows which futurity casts upon the present; the words which express what they understand not; the trumpets which sing to battle, and feel not what they inspire; the influence which is moved not, but moves. Poets are the unacknowledged legislators of the world.

[52] Suggests Isa. 1.18.

[53] Theseids: Poems on the exploits of Theseus. Codri: Poets who are like a badly thought of poet who is supposed to have written a tragedy about Theseus, but it is likely that he never actually existed. Bavius and Mavius were poetasters who attacked the poetry of their contemporaries Horace and Virgil.

[54] Never written.

Georg Wilhelm Friedrich Hegel

1770–1831

Hegel's aesthetic forms an integral part of his organic philosophy. The idea of the absolute or spirit is the all-inclusive infinite whole, an organic unity in which every part is dependent on and definable in terms of every other part and of the whole itself. Man is part of this whole, and a concrete definition of man must be made in its terms. Crucial to this philosophical scheme is Hegel's conception of dialectic, elaborated in his *Phenomenology of Mind*, tracing the moments of progression from subject (Spirit) to substance. In Hegel's treatment, dialectic proceeds, thesis to antithesis to synthesis, by the process of *sublation* (*auf heben*) in which each thesis is cancelled, lifted up, and preserved, from pure subjectivity to the "absolute standpoint" of spirit as substance.

In the selection below from *The Philosophy of Fine Art,* Hegel insists that art must be treated not in terms of its use "as a mere pastime in the service of pleasure and entertainment" or in terms of any other ulterior purpose; instead it must be considered a mode, like religion and philosophy, through which the idea is made available to consciousness. It is one of the modes by which absolute spirit comes to consciousness of itself. Art presents its matter in sensuous forms. The beautiful in art is the idea carried into concrete form. There are fundamentally three kinds of art—symbolic, classical, and romantic. Hegel explains the first two with more clarity than he does the third. By "symbolic" art Hegel means something very much like what many Romantic critics call allegory. It is an art in which objects represented are made to have arbitrary meanings. In "classical" art there is a much more appropriate relationship between idea and embodiment. For example, the human form in classical art is, according to Hegel, a natural shape appropriate to a representation of the mind. In classical art form and content are merged.

"Romantic art" makes the "inward life of reason . . . the medium and determinate existence of its content." This kind of art transcends itself, so to speak, and canons of appropriateness invoked with respect to symbolic and classical art are cast aside. Art becomes its own domain, the release of Spirit into art itself, not merely into objects represented in art.

Hegel goes on to associate architecture with symbolic art and sculpture with classical art. Romantic art is realized by painting, music, and poetry in ascending order of freedom. In this series of definitions, one observes Hegel making his judgments on the basis of the distance each art is able to traverse in escape from matter, mass, and spatialization. In these terms, painting is more ideal than sculpture, which is more ideal than architecture. Music is more ideal than painting, for in music objects are not represented and a temporal order alone exists. The medium of poetry—words—is most free. Its sensuousness is created by the mind, not by the materials of the art.

In the later parts of his work Hegel considers various sorts of poetry and develops a theory of tragedy. Despite the attention he lavishes on art, however, he does not consider it the highest manifestation of the Idea. It is limited by its media and finally proves less satisfactory to man than religion or philosophy. For many recent critics and theorists, interest in Hegel has centered more on his *Phenomenology* than his aesthetic theory, as the expression of a totalizing system that in seeking a "universal standpoint" becomes particularly problematic in the practical domain of social and intellectual life. Included here is a crucial chapter, "Lordship and Bondage," from the *Phenomenology*.

Hegel's *The Philosophy of Fine Art* has been translated in four volumes by F. P. B. Osmaston (1920). See also *The Introduction to Hegel's Philosophy of Fine Art*, translated by Bernard Bosanquet (1886), also translated by T. M. Knox (1975). Bosanquet's translation was reprinted and edited by Michael Inwood (1993). See A. C. Bradley, "Hegel's Theory of Tragedy" in his *Oxford Lectures on Poetry* (1910); W. T. Stace, *The Philosophy of Hegel* (1924); Israel Knox, *The Aesthetic Theories of Kant, Hegel, and Schopenhauer* (1936); Jack Kaminsky, *Hegel on Art: An Interpretation of Hegel's Aesthetics* (1962); Alexandre Kojeve, *Introduction to the Reading of Hegel* (tr. 1969); Jean Hippolyte, *Genesis and Structure of Hegel's Phenomenology of Spirit* (tr. 1974); Stephen Bungay, *Beauty and Truth: A Study of Hegel's Aesthetics* (1984); Robert Wicks, *Hegel's Theory of Aesthetic Judgment* (1994); Paul Redding, *Hegel's Hermeneutics* (1996); William Meker, ed., *Hegel and Aesthetics* (2000); Allen Speight, *Hegel, Literature, and the Problem of Agency* (2001).

The Philosophy of Fine Art

from

Introduction

First, as to the worthiness of art to form the object of scientific inquiry, it is no doubt the case that art can be utilized as a mere pastime in the service of pleasure and entertainment, either in the embellishment of our surroundings, the imprinting of a delight-giving surface to the external conditions of life, or the emphasis placed by decoration on other objects. In these respects it is unquestionably no independent or free art, but an art subservient to certain objects. The kind of art, however, which we ourselves propose to examine is one which is free in its aim and its means. That art in general can serve other objects, and even be merely a pastime, is a relation which it possesses in common with thought itself. From one point of view thought likewise, as science subservient to other ends, can be used in just the same way for finite purposes and means as they chance to crop up, and as such serviceable faculty of science is not self-determined, but determined by something alien to it. But, further, as distinct from such subservience to particular objects, science is raised of its own essential resources in free independence to truth, and exclusively united with its own aims in discovering the true fulfillment in that truth.

Fine art is not art in the true sense of the term until it is also thus free, and its highest function is only then satisfied when it has established itself in a sphere which it shares with religion and philosophy, becoming thereby merely one mode and form through which the divine, the profoundest interests of mankind, and spiritual truths of widest range, are brought home to consciousness and expressed. It is in works of art that nations have deposited the richest intuitions and ideas they possess; and not infrequently fine art supplies a key of interpretation to the wisdom and religion of peoples; in the case of many it is the only one.[1]

The manuscript notes for Hegel's lectures on aesthetics were posthumously published in 1835. The lectures were first given in 1820, and revised in 1823, 1826, and 1829. The text is from *The Philosophy of Fine Art* by Georg Wilhelm Friedrich Hegel, translated by F. P. B. Osmaston (1920).

[1] Hegel goes on to elaborate the parallel between art, philosophy, and religion as ideally penetration into the profundity of a supersensuous world.

* * *

It has already been stated that the content of art is the idea, and the form of its display the configuration of the sensuous or plastic image. It is further the function of art to mediate these two aspects under the reconciled mode of free totality. The first determinant implied by this is the demand that the content, which has to secure artistic representation, shall disclose an essential capacity for such display. If this is not so all that we possess is a defective combination. A content that, independently, is ill adapted to plastic form and external presentment is compelled to accept this form, or a matter that is of itself prosaic in its character is driven to make the best it can of a mode of presentation which is antagonistic to its nature.

The second requirement, which is deducible from the first, is the demand that the content of art should be nothing essentially abstract. This does not mean, however, that it should be merely concrete in the sense that the sensuous object is such in its contrast to all that is spiritual and the content of thought, regarding these as the essentially simple and abstract. Everything that possesses truth for spirit, no less than as part of nature, is essentially concrete, and, despite its universality, possesses both ideality[2] and particularity essentially within it. When we state, for example, of God that he is simply One, the Supreme Being as such, we have thereby merely given utterance to a lifeless abstraction of the irrational understanding. Such a God, as he is thus not conceived in his concrete truth, can supply no content for art, least of all plastic art. Consequently neither the Jews nor the Turks have been able to represent their God, who is not even an abstraction of the understanding in the above sense, under the positive mode in which Christians have represented him. For in Christianity God is conceived in his truth, and as such essentially concrete, as personality, as the subjective focus of conscious life or, more accurately defined, as spirit.

* * *

Inasmuch, however, as it is the function of art to represent the idea to immediate vision in sensuous shape and not in the form of thought and pure spirituality in the strict sense, and inasmuch as the value and intrinsic worth of this presentment consists in the correspondence and unity of the two aspects, that is the idea and its sensuous shape, the supreme level and excellence of art and the reality, which is truly consonant with its notion, will depend upon the degree of intimacy and union with which idea and configuration appear together in elaborated fusion. The higher truth consequently is spiritual content which has received the shape adequate to the conception of its essence; and this it is which supplies the principle of division for the philosophy of art. For before the mind can attain to the true notion of its absolute essence; it is constrained to traverse a series of stages rooted in this very notational concept; and to this course of stages which it unfolds to itself, corresponds a coalescent series, immediately related therewith, of the plastic types of art, under the configuration whereof mind as art spirit presents to itself the consciousness of itself.[3]

This evolution within the art spirit has further itself two sides in virtue of its intrinsic nature. First, that is to say, the development is itself a spiritual and universal one; in other words there are the definite and comprehensive views of the world[4] in their series of gradations which give artistic embodiment to the specific but widely embracing consciousness of nature, man, and God. Secondly, this ideal or universal art development has to provide for itself immediate existence and sensuous configuration, and the definite modes of this art actualization in the sensuous medium are themselves a totality of necessary distinctions in the realm of art—that is to say, they are the particular types of art. No doubt the types of artistic configuration on the one hand are, in respect to their spirituality, of a general character, and not restricted to any one material, and the sensuous existence is similarly itself of varied multiplicity of medium. Inasmuch, however, as this material potentially possesses, precisely as the mind or spirit does, the idea for its inward soul or significance, it follows that a definite sensuous involves with itself a closer relation and secret bond of association with the spiritual distinctions and specific types of artistic embodiment.[5]

Relatively to these points of view our philosophy will be divided into three fundamental parts.

First, we have a general part. It has for its content and object the universal idea of fine art, conceived here as the ideal, together with the more elaborated relation under which it is placed respectively to nature and human artistic production.

---

[2] [Osmaston] *Subjectivität*, that is, the ideality of consciousness or thought.

[3] [Osmaston] That is to say, presents itself to conscious grasp of itself as such art spirit *(als künstlerischer)*.

[4] [Osmaston] The two evolutions here alluded to are (1) that of a particular way of regarding nature, man, and God in a particular age and nation such as the Egyptian, Greek, and Christian viewed in express relation to art; (2) the several arts—sculpture, music, poetry, and so forth each on their own foundation and viewed relatively to the former evolution.

[5] [Osmaston] The point, of course, is that the different media of the several arts are inherently, and in virtue of the fact that we have not here mere matter as opposed to that which is intellectual rather than sensuous, but matter in which the notional concept is already essentially present or pregnant (sound is, for instance, more ideal than the spatial matter of architecture), adapted to the particular arts in which they serve as the medium of expression.

Secondly, we have evolved from the notional concept of the beauty of art a particular part, insofar as the essential distinctions, which this idea contains in itself, are unfolded in a graduated series of particular modes of configuration.

Thirdly, there results a final part which has to consider the particularized content of fine art itself. It consists in the advance of art to the sensuous realization of its shapes and its consummation in a system of the several arts and their genera and species.

2. In respect to the first and second of these divisions it is important to recollect, in order to make all that follows intelligible, that the idea, viewed as the beautiful in art, is not the idea in the strict sense, that is as a metaphysical logic apprehends it as the absolute. It is rather the idea as carried into concrete form in the direction of express realization, and as having entered into immediate and adequate unity with such reality. For the idea as such, although it is both potentially and explicitly true, is only truth in its universality and not as yet presented in objective embodiment.

* * *

3. But inasmuch as in this way the idea is concrete unity, this unity can only enter the artistic consciousness by the expansion and further mediation of the particular aspects of the idea; and it is through this evolution that the beauty of art receives a totality of particular stages and forms. Therefore, after we have considered fine art in its essence and on its own account, we must see how the beautiful in its entirety breaks up into particular determinations. This gives, as our second part, the doctrine of the types of art. The origin of these types is to be found in the varied ways under which the idea is conceived as the content of art; it is by this means that a distinction in the mode of form under which it manifests itself is conditioned. These types are therefore simply the different modes of relation which obtain between the idea and its configuration, relations which emanate from the idea itself, and thereby present us with the general basis of division for this sphere. For the principle of division must always be found in the notional concept, the particularization and division of which it is.

We have here to consider three relations of the idea to its external process of configuration.

a. First, the origin of artistic creation proceeds from the idea when, being itself still involved in defective definition and obscurity, or in vicious and untrue determinacy, it becomes embodied in the shapes of art. As indeterminate it does not as yet possess in itself that individuality which the ideal demands. Its abstract character and one-sidedness leaves its objective presentment still defective and contingent. Consequently this first type of art is rather a mere search after plastic configuration than a power of genuine representation. The idea has not as yet found the formative principle within itself, and therefore still continues to be the mere effort and strain to find it. We may in general terms describe this form as the *symbolic* type of art. The abstract idea possesses in it its external shape outside itself in the purely material substance of nature, from which the shaping process proceeds, and to which in its expression it is entirely yoked. Natural objects are thus in the first instance left just as they are, while, at the same time the substantive idea is imposed upon them as their significance, so that their function is henceforth to express the same, and they claim to be interpreted, as though the idea itself was present in them. A rationale of this is to be found in the fact that the external objects of reality do essentially possess an aspect in which they are qualified to express a universal import. But as a completely adequate coalescence is not yet possible, all that can be the outcome of such a relation is an abstract attribute, as when a lion is understood to symbolize strength.

On the other hand this abstractness of the relation makes present to consciousness no less markedly how the idea stands relatively to natural phenomena as an alien; and albeit it expatiates in all these shapes, having no other means of expression among all that is real, and seeks after itself in their unrest and defects of genuine proportion, yet for all that it finds them inadequate to meet its needs. It consequently exaggerates natural shapes and the phenomena of nature in every degree of indefinite and limitless extension; it flounders about in them like a drunkard, and seethes and ferments, doing violence to their truth with the distorted growth of unnatural shapes, and strives vainly by the contrast, hugeness, and splendor of the forms accepted to exalt the phenomena to the plain of the idea. For the idea is here still more or less indeterminate, and unadaptable, while the objects of nature are wholly definite in their shape.

Hence, on account of the incompatibility of the two sides of ideality and objective form to one another, the relation of the idea to the other becomes a negative one. The former, being in its nature ideal, is unsatisfied with such an embodiment, and posits itself as its inward or ideally universal substance under a relation of sublimity over and above all this inadequate superfluity of natural form. In virtue of this sublimity the natural phenomena, of course, and the human form and event are accepted and left simply as they are, but at the same time, recognized as unequal to their significance, which is exalted far above all earthly content.

These features constitute in general terms the character of the primitive artistic pantheism of the East, which, on the one hand, charges the meanest objects with the significance of the absolute idea, or, on the other, compels natural form, by doing violence to its structure, to express its world ideas. And, in consequence, it becomes bizarre, grotesque, and deficient in taste, or turns the infinite but abstract freedom of the substantive idea contemptuously against all phenomenal existence as alike nugatory and evanescent. By such means the significance cannot be completely presented in the expression, and despite all straining and endeavor the final inadequacy of plastic configuration to idea remains insuperable. Such may be accepted as the first type of art—symbolic art with its yearning, its fermentation, its mystery, and sublimity.

b. In the second type of art, which we propose to call *classical,* the twofold defect of symbolic art is annulled. Now the symbolic configuration is imperfect, because, first, the idea here only enters into consciousness in abstract determinacy or indeterminateness: and, secondly, by reason of the fact that the coalescence of import with embodiment can only throughout remain defective, and in its turn also wholly abstract. The classical art type solves both these difficulties. It is, in fact, the free and adequate embodiment of the idea in the shape which, according to its notional concept, is uniquely appropriate to the idea itself. The idea is consequently able to unite in free and completely assonant concord with it. For this reason the classical type of art is the first to present us with the creation and vision of the complete ideal, and to establish the same as realized fact.

The conformability, however, of notion and reality in the classical type ought not to be taken in the purely formal sense of the coalescence of a content with its external form, any more than this was possible in the case of the ideal. Otherwise every copy from nature, and every kind of portrait, every landscape, flower, scene, and so forth, which form the aim of the presentment, would at once become classical in virtue of the fact of the agreement it offers between such content and form. In classical art, on the contrary, the characteristic feature of the content consists in this, that it is itself concrete idea, and as such the concrete spiritual; for it is only that which pertains to spirit which is veritable ideality.[6] To secure such a content we must find out that in nature which on its own account is that which is essentially and explicitly appropriate to the spiritual. It must be the original notion itself,[7] which has invented the form for concrete spirituality, and now the subjective notion—in the present case the spirit of art—has merely discovered it, and made it, as an existence possessed of natural shape, concordant with free and individual spirituality. Such a configuration, which the idea essentially possesses as spiritual, and indeed as individually determinate spirituality, when it must perforce appear as a temporal phenomenon, is the human form. Personification and anthropomorphism have frequently been abused as a degradation of the spiritual. But art, insofar as its function is to bring to vision the spiritual in sensuous guise, must advance to such anthropomorphism, inasmuch as spirit is only adequately presented to perception in its bodily presence. The transmigration of souls in this respect an abstract conception,[8] and physiology ought to make it one of its fundamental principles, that life has necessarily, in the course of its evolution, to proceed to the human form, for the reason that it is alone the visible phenomenon adequate to the expression of intelligence.

The human bodily form, then, is employed in the classical type of art not as purely sensuous existence, but exclusively as the existence and natural shape appropriate to mind. It has therefore to be relieved of all the defective excrescences which adhere to it in its purely physical aspect, and from the contingent finiteness of its phenomenal appearance. The external shape must in this way be purified in order to express in itself the content adequate for such a purpose; and, furthermore, along with this, that the coalescence of import and embodiment may be complete, the spirituality which constitutes the content must be of such a character that is it completely able to express itself in the natural form of man, without projecting beyond the limits of such expression within the sensuous and purely physical sphere of existence. Under such a condition spirit is at the same time defined as particular, the spirit or mind of man, not as simply absolute and eternal. In this latter case it is only capable of asserting and expressing itself as intellectual being.[9]

Out of this latter distinction arises, in its turn, the defect which brings about the dissolution of the classical type of art, and makes the demand for a third and higher form, namely the *romantic* type.

c. The romantic type of art annuls the completed union of the idea and its reality, and occurs, if on a higher plane, to the difference and opposition of both sides, which remained unovercome in symbolic art. The classical type of art no doubt attained the highest excellence of which the sensuous embodiment of art is capable. The defect, such as it is, is due to the effect which obtains in art itself throughout, the limitations of its entire province, that is to say. The limitation consists in this, that art in general and, agreeably to its fundamental idea, accepts for its object spirit, the notion of which is infinite concrete universality, under the guise of sensuously concrete form. In the classical type it sets up the perfected coalescence of spiritual and sensuous existence as adequate conformation of both. As a matter of fact, however, in this fusion mind itself is not represented agreeably to its true notional concept. Mind is the infinite subjectivity of the idea, which as absolute inwardness,[10] is not capable of freely expanding in its entire independence, so long as it remains within the mold of the bodily shape, fused therein as in the existence wholly congenial to it.

---

[6] [Osmaston] *Das wahrhaft Innere.* That is, the inward of the truth of conscious life.

[7] [Osmaston] Means apparently the notion in its absolute sense.

[8] [Osmaston] Because it represents spirit as independent of an appropriate bodily form.

[9] [Osmaston] What appears to be denoted by *Geistigkeit* is the generic term of intelligence—that activity of conscious life which does not necessarily make us think of a single individual—the common nature of all spirit.

To escape from such a condition the romantic type of art once more cancels that inseparable unity of the classical type, by securing a content which passes beyond the classical stage and its mode of expression. This content, if we may recall familiar ideas—is coincident with what Christianity affirms to be true of God as spirit, in contrast to the Greek faith in gods which forms the essential and most fitting content of classical art. In Greek art the concrete ideal substance is potentially, but not as fully realized, the unity of the human and divine nature; a unity which for the very reason that it is purely immediate and not wholly explicit, is manifested without defect under an immediate and sensuous mode. The Greek god is the object of naive intuition and sensuous imagination. His shape is therefore the bodily form of man. The sphere of his power and his being is individual and individually limited; and in his opposition to the individual person[11] is an essence and a power with whom the inward life of soul[12] is merely potentially in unity, but does not itself possess this unity as inward subjective knowledge. The higher stage is the knowledge of this implied unity, which in its latency the classical art type receives as its content and is able to perfectly represent in bodily shape. This elevation of mere potentiality into self-conscious knowledge constitutes an enormous difference. It is nothing less than the infinite difference which, for example, separates man generally from the animal creation. Man is animal; but even in his animal functions he is not restricted within the potential sphere as the animal is, but becomes conscious of them, learns to understand them, and raises them—as, for instance, the process of digestion—into self-conscious science. By this means man dissolves the boundaries of his merely potential immediacy; in virtue of the very fact that he knows himself to be animal he ceases to be merely animal, and as mind is endowed with self-knowledge.

If, then, in this way the unity of the human and divine nature, which in the previous stage was potential, is raised out of this immediate into a self-conscious unity, it follows that the genuine medium for the reality of this content is no longer the sensuous and immediate existence of what is spiritual, that is, the physical body of man, but the self-aware inner life of soul itself. Now it is Christianity—for the reason that it presents to mind God as spirit, and not as the particular individual spirit, but as absolute in spirit and in truth—which steps back from the sensuousness of imagination into the inward life of reason, and makes this rather than bodily form the medium and determinate existence of its content. So also, the unity of the human and divine nature is a conscious unity exclusively capable of realization by means of spiritual knowledge, and in spirit. The new content secured thereby is consequently not indefeasibly bound up with the sensuous presentation, as the mode completely adequate, but is rather delivered from this immediate existence, which has to be hypostatized as a negative factor, overcome and reflected buck into the spiritual unity. In this way romantic art must be regarded as art transcending itself, albeit within the boundary of its own province, and in the form of art itself.

We may therefore briefly summarize our conclusion that in this third stage the object of art consists in the free and concrete presence of spiritual activity, whose vocation it is to appear as such a presence or activity for the inner world of conscious intelligence. In consonance with such an object art cannot merely work for sensuous perception. It must deliver itself to the inward life, which coalesces with its object simply as though this were none other than itself, in other words, to the intimacy of soul, to the heart, the emotional life, which as the medium of spirit itself essentially strives after freedom and seeks and possesses its reconciliation only in the inner chamber of spirit. It is this inward or ideal world which constitutes the content of the romantic sphere: it will therefore necessarily discover its representation as such inner idea or feeling, and in the show or appearance of the same. The world of the soul and intelligence celebrates its triumph over the external world, and, actually in the medium of that outer world, makes that victory to appear, by reason of which the sensuous appearance sinks into worthlessness.

---

[10] [Osmaston] By *Innerlichkeit*, which might also be rendered as pure ideality, what is signified is that in a mental state there are no parts outside of each other.

[11] [Osmaston] *Subjectikt*, that is, the individual ego of self-consciousness.

[12] [Osmaston] *Das subjektive Innere*, literally, the subjective inner state.

On the other hand, this type of art, like every other, needs an external vehicle of expression. As already stated, the spiritual content has here withdrawn from the external world and its immediate unity into its own world. The sensuous externality of form is consequently accepted and represented, as in the symbolic type, as unessential and transient; furthermore the subjective finite spirit and volition is treated in a similar way; a treatment which even includes the idiosyncrasies or caprice of individuals, character, action, or the particular features of incident and plot. The aspect of external existence is committed to contingency and handed over to the adventurous action of imagination, whose caprice is just as able to reflect the facts given as they are, as it can change the shapes of the external world into a medley of its own invention and distort them to mere caricature. For this external element has no longer its notion and significance in its own essential province, as in classical art. It is now discovered in the emotional realm, and this is manifested in the medium of that realm itself rather than in the external and its form of reality, and is able to secure or to recover again the condition of reconciliation with itself in every accident, in all the chance circumstance that falls into independent shape, in all misfortune and sorrow, nay, in crime itself.

Hence it comes about that the characteristics of symbolic art, its indifference, incompatibility and severance of idea from configurative expression, are here reproduced once more, if with essential difference. And this difference consists in the fact that in romantic art the idea, whose defectiveness, in the case of the symbol, brought with it the defect of external form, has to display itself as spirit and in the medium of soul life as essentially self-complete. And it is to complete fundamentally this higher perfection that it withdraws itself from the external element. It can, in short, seek and consummate its true reality and manifestation nowhere but in its own domain.

This we may take to be in general terms the character of the symbolic, classical, and romantic types of art, which in fact constitute the three relations of the idea to its embodiment in the realm of human art. They consist in the aspiration after, the attainment and transcendency of the ideal, viewed as the true concrete notion of beauty.

* * *

Each general type discovers its determinate character in one determinate external material or medium, in which its adequate presentation is secured under the manner it prescribes. But, from another point of view, these types of art, inasmuch as their definition is nonetheless consistent with the fact of the universality of their typical import, break through the boundaries of their specific realization in some definite art species, and achieve an existence in other arts no less, although their position in such is of subordinate importance. For this reason, albeit the particular arts belong specifically to one of these general art types respectively, the adequate external embodiment whereof they severally constitute, yet this does not prevent them, each after its own mode of external configuration, from representing the totality of these art types.[13] To summarize, then, in this third principal division we are dealing with the beauty of art, as it unveils itself in a world of realized beauty by means of the arts and their creations. The content of this world is the beautiful, and the true beautiful, as we have seen, is spiritual being in concrete form, the ideal; or apprehended with still more intimacy it is the absolute mind and truth itself. This region of divine truth artistically presented to sensuous vision and emotion forms the center of the entire world of art. It is the independent, free and divine image,[14] which has completely appropriated the externality of form and medium, and now wears them simply as the means of its self-manifestation. Inasmuch, however, as the beautiful is unfolded here as objective reality, and in this process is differentiated into particular aspects and phases, this center posits its extremes, as realized in their peculiar actuality, in antithetical relation to itself. Thus one of these extremes consists of an objectivity as yet devoid of mind, which we may call the natural environment of God. Here the external element, when it receives form, remains as it was, and does not possess its spiritual aim and content in itself, but in another.[15] The other extreme is the divine as inward, something known, as the manifold particularized subjective existence of deity. It is the truth as operative and vital in sense, soul, and intelligence of particular persons, which does not persist as poured forth into its mold of external shape, but returns into the inward life of individuals. The divine is under such a mode at once distinguishable from its pure manifestation as Godhead, and passes itself thereby into the variety of particularization which belongs to every kind of particular subjective knowledge, feeling, perception, and emotion. In the analogous province of religion with which art, at its highest elevation, is immediately connected, we conceive the same distinction as follows. First, we imagine the natural life on earth in its finitude as standing on one side; but then, secondly, the human consciousness accepts

---

[13] [Osmaston] Thus poetry is primarily a Romantic art, but in the epic it is affiliated with the objective character of classical art, or we may say that there is a romantic and classical type of architecture, though the art is primarily symbolic.

[14] [Osmaston] *Gestalt*. "Plastic power" is perhaps a better translation.

[15] [Osmaston] He means that in architecture the building is merely a shrine or environment of the image of the god.

God for its object, in which the distinction between objectivity and subjectivity falls away; then, finally, we advance from God as such to the devotion of the community, that is to God as he is alive and present in the subjective consciousness. These three fundamental modifications present themselves in the world of art in independent evolution.

a. The first of the particular arts with which, according to their fundamental principle, we have to start is architecture considered as a fine art. Its function consists in so elaborating the external material of inorganic nature that the same becomes intimately connected with spirit as an artistic and external environment. Its medium is matter itself as an external object, a heavy mass that is subject to mechanical laws; and its forms persist as the forms of inorganic nature coordinated with the relations of the abstract understanding such as symmetry and so forth. In this material and in these forms the ideal is incapable of realization as concrete spirituality, and the reality thus presented remains confronting the idea as an external fabric with which it enters into no fusion, or has only entered so far as to establish an abstract relation. And it is in consequence of this that the fundamental type of the art of building is that of symbolism. Architecture is in fact the first pioneer on the highway toward the adequate realization of Godhead. In this service it is put to severe labor with objective nature, that it may disengage it by its effort from the confused growth of finitude and the distortions of contingency. By this means it levels a space for the God, informs his external environment, and builds him his temple, as a fit place for the concentration of spirit, and its direction to the absolute objects of intelligent life. It raises an enclosure for the congregation of those assembled, as a defense against the threatening of the tempest, against rain, the hurricane, and savage animals. It in short reveals the will thus to assemble, and although under an external relation, yet in agreement with the principles of art. A significance such as this it can to a greater or less extent import into its material and its forms, in proportion as the determinate content of its fabric, which is the object of its operations and effort, is more or less significant, is more concrete or more abstract, more profound in penetrating its own essential depth, or more obscure and superficial. Indeed architecture may in this respect proceed so far in the execution of such a purpose as to create an adequate artistic existence for such an ideal content in its very forms and material. In doing so, however, it has already passed beyond its peculiar province and is diverted into the stage immediately above it of sculpture. For the boundary of sculpture lies precisely in this that it retains the spiritual as an inward being which persists in direct contrast to the external embodiment of architecture. It can consequently merely point to that which is absorbed in soul life as to something external to itself.

b. Nevertheless, as above explained, the external and inorganic world is purified by architecture, it is coordinated under symmetrical laws, and made cognate with mind, and as a result the temple of God, the house of his community, stands before us. Into this temple, in the second place, the God himself enters in the lightning-flash of individuality which smites its way into the inert mass, permeating the same with its presence. In other words the infinite[16] and no longer purely symmetrical form belonging to intelligence brings as it were to a focus and informs the shape in which it is most at home. This is the task of sculpture. Insofar as in it the inward life of spirit, to which the art of architecture can merely point away to, makes its dwelling within the sensuous shape and its external material, and to the extent that these two sides come into plastic communion with one another in such a manner that neither is predominant, sculpture receives as its fundamental type the classical art form.

For this reason the sensuous element on its own account admits of no expression here which is not affected by spiritual affinities,[17] just as, conversely, sculpture can reproduce with completeness no spiritual content, which does not maintain throughout adequate presentation to perception in bodily form. What sculpture, in short, has to do is to make the presence of spirit stand before us in its bodily shape and in immediate union therewith at rest and in blessedness; and this form has to be made vital by means of the content of spiritual individuality. The external sensuous material is consequently no longer elaborated either in conformity with its mechanical quality alone, as a mass of weight, nor in shapes of the inorganic world simply, nor in entire indifference to color, etc. It is carried into the ideal forms of the human figure, and, we may add, in the completeness of all three spatial dimensions. In other words and relatively to such a process we must maintain for sculpture that in it the inward or ideal content of spirit are first revealed in their eternal repose and essential self-stability. To such repose and unity with itself there can only correspond that external shape which itself persists in such unity and repose. And this condition is satisfied by configuration viewed in its abstract spatiality.[18] The spirit which sculpture represents is that which is essentially sound, not broken up in the play of chance conceits and passions; and for this reason its external form also is not dissolved in the manifold variety of appearance, but exhibits itself under this one presentment only as the abstraction of space in the totality of its dimensions.

---

[16] [Osmaston] Infinite, of course, in the concrete sense of rounded in itself, as the circle, or, still more, the living organism.

[17] [Osmaston] Literally, "which is not also that of the spiritual sphere."

[18] [Osmaston] That is, an object limited only in space.

Assuming, then, that the art of architecture has executed its temple, and the hand of sculpture has placed therein the image of the god, we have in the third place to assume the community of the faithful as confronting the god thus presented to vision in the wide chambers of his dwelling place. Now this community is the spiritual reflection into its own world of that sensuous presence, the subjective and inward animating life of soul, in its union with which both for the artistic content and the external material which manifests it, the determining principle may be identified with particularization in varied shapes and qualities, individualization and the life of soul[19] which they imply. The downright and solid fact of unity the god possesses in sculpture breaks up into the multiplicity of a world of particular souls,[20] whose union is no longer sensuous but wholly ideal.

Here for the first time God himself is revealed as veritably spirit—viz., the spirit revealed in his community. Here at last he is seen apprehended as this moving to and fro, as this alternation between his own essential unity and his realization in the knowledge of individual persons and that separation which it involves, as also in the universal spiritual being[21] and union of the many. In such a community God is disengaged from the abstraction of his unfolded self-seclusion and self-identity, no less than from the immediate absorption in bodily shape, in which he is presented by sculpture. He is, in a word, lifted into the actual sphere of spiritual existence and knowledge, into the reflected appearance, whose manifestation is essentially inward and the life of heart and soul. Thereby the higher content is now the nature of spirit, and that in its ultimate or absolute shape. But at the same time the separation to which we have alluded displays this as particular spiritual being, a specific emotional life. Moreover, for the reason that the main thing here is not the untroubled repose of the God in himself,[22] but his manifestation simply, the Being which is for another, self-revealment in fact, it follows that, on the plane we have now reached, all the varied content of human subjectivity in its vital movement and activity, whether viewed as passion, action, or event, or more generally the wide realm of human feeling, volition and its discontinuance, become one and all for their own sake objects of artistic representation.

* * *

The arts, which are lifted into a higher strain of ideality, abandoning as they do the symbolism of architecture and the classical ideal of sculpture, accept their predominant type from the romantic art form; and these are the arts most fitted to express its mode of configuration. They are, however, a totality of arts, because the romantic type is itself essentially the most concrete.

c. The articulation of this third sphere of the particular arts may be fixed as follows:

(1) The first art which comes next to sculpture is that of painting. It avails itself for a medium of its content and the plastic configuration of the same of visibility as such, to the extent that it is differentiated in its own nature, in other words is defined in the continuity of color. No doubt the material of architecture and sculpture is likewise both visible and colored. It is, however, not, as in painting, visibility in its pure nature, not the essentially simple light, which by its differentiating of itself in its opposition to darkness, and in association with that darkness gives rise to color.[23] This quality of visibility made essentially ideal[24] and treated as such no longer either requires, as in architecture, the abstractly mechanical qualities of mass as appropriate to materials of weight, nor, as is the case with sculpture, the complete dimensuration of spatial condition, even when concentrated into organic forms. The visibility and the making apparent, which belong to painting, possess differences of quality under a more ideal mode—that is, in the specific varieties of color—which liberates art from the objective totality of spatial condition, by being limited to a plane surface.

(2) The second art which continues the further realization of the romantic type and forms a distinct contrast to painting is that of music. Its medium, albeit still sensuous, yet proceeds into still profounder subjectivity and particularization. We have here, too, the deliberate treatment of the sensuous medium as ideal, and it consists in the negation and idealization into the isolated unity of a single point,[25]

---

[19] *Subjektivität.* The particularization in romantic art implies the presence of an ideal element imported by the soul of the artist, which appeals directly to the soul in its emotional life. Compare a picture by an Italian master with a Greek statue.

[20] [Osmaston] Literally, "a multipicity of isolated examples of inwardness."

[21] [Osmaston] That is, in the life shared by all as one community actuated by a common purpose.

[22] [Osmaston] As in sculpture.

[23] [Osmaston] Reference, of course, to Hegel's unfortunate acceptance of Goethe's theory of color.

[24] [Osmaston] The color of art is not merely ideal as applied to only two dimensions of space, but also is "subjective" in the artistic treatment of it under a definite "scheme." It is not clear whether Hegel alludes also to this; apparently not, though it is the most important feature. In fact, even assuming his theory of light to be correct, it is difficult entirely to follow his distinction between the appearance of color on a flat or a round surface. As natural color the one would be as ideal as the other. Only regarded as a composition would painting present distinction.

[25] [Osmaston] The parts of a chord are not in space, but are ideally cognized. Hegel describes this by saying that music idealizes space and concentrates it to a point. It would perhaps be more intelligible to say that it transmutes the positive effects of a material substance in motion into the positive and more ideal condition of time. The point which is continually negated is at least *qua* music the point, or rather, moment, of a temporal process.

the indifferent external collocation of space,[26] whose complete appearance is retained by painting and deliberately feigned in its completeness. This isolated point, viewed as this process of negation, is an essentially concrete and active process of cancellation within the determinate substance of the material medium, viewed, that is, as motion and vibration of the material object within itself and in its relation to itself. Such an inchoate ideality of matter, which no longer appears under the form of space, but as temporal ideality,[27] is sound or tone. We have here the sensuous set down as negated, and its abstract visibility converted into audibility. In other words sound liberates the ideal content from its fetters in the material substance. This earliest[28] secured inwardness of matter and impregnation of it with soul life supplies the medium for the intimacy and soul of spirit—itself as yet indefinite—permitting, as it does, the echo and reverberation of man's emotional world through its entire range of feelings and passions. In this way music forms the center of the romantic arts, just as sculpture represents the midway point of arrest between architecture and the arts of the romantic subjectivity. Thus, too, it forms the point of transition between the abstract, spatial sensuousness of painting and the abstract spirituality of poetry. Music carries within itself, like architecture, and in contrast to the emotional world simply and its inward self-seclusion, a relation of quantity conformable to the principles of the understanding and their modes of coordinated configuration.[29]

(3) We must look for our third and most spiritual type of artistic presentation among the romantic arts in that of poetry. The supreme characteristic of poetry consists in the power with which it brings into vassalage of the mind and its conceptions the sensuous element from which music and painting began to liberate art. For sound, the only remaining external material retained by poetry, is in it no longer the feeling of the sonorous itself, but is a mere sign without independent significance. And it is, moreover, a sign of idea which has become essentially concrete, and not merely[30] of indefinite feeling and its subtle modes and gradations. And this is how sound develops into the word, as essentially articulate voice, whose intention it is to indicate ideas and thoughts. The purely negative moment to which music advanced now asserts itself as the wholly concrete point, the point which is mind itself, the self-conscious individual, which produces from itself the infinite expansion of its ideas and unites the same with the temporal condition of sound. Yet this sensuous element, which was still in music immediately united to emotion, is in poetry separated from the content of consciousness. Mind, in short, here determines this content for its own sake and apart from all else into the content of idea; to express such idea it no doubt avails itself; of sound, but employs it merely as a sign without independent worth or substance. . . . Poetry is, in short, the universal art of the mind, which has become essentially free, and which is not fettered in its realization to an externally sensuous material, but which is creatively active in the space and time belonging to the inner world of ideas and emotion. Yet it is precisely in this its highest phase, that art terminates, by transcending itself: it is just here that it deserts the medium of a harmonious presentation of mind in sensuous shape and passes from the poetry of imaginative idea into the prose of thought.

* * *

To sum up, then, what the particular arts realize in particular works of art, are according to their fundamental conception, simply the universal types which constitute the self-unfolding idea of beauty. It is as the external realization of this idea that the wide pantheon of art is being raised; and the architect and builder thereof is the spirit of beauty as it gradually comes to self-cognition, and to complete which the history of the world will require its evolution of centuries.

The Phenomenology of Mind

Independence and Dependence of Self-Consciousness: Lordship and Bondage

Self-consciousness exists in itself and for itself, in that, and by the fact that it exists for another self-consciousness; that is to say, it *is* only by being acknowledged or "recognized."

---

[26] [Osmaston] By the indifferent externality of space is signified the fact that the parts of space, though external to each other, are not qualitatitively distinguishable.

[27] [Osmaston] Succession in time is "more ideal" than coexistence in space because it exists only as continuity in a conscious subject.

[28] [Osmaston] Painting no doubt introduces ideal elements into the artistic composition of color, but the color still remains the appearance of a material thing or superficies.

[29] [Osmaston] That is to say, music or harmony is based on a solid conformity to law on the part of its tones, in their conjunction and succession, their structure and resolution.

[30] [Osmaston] As in painting.

"Independence and Dependence of Self-Consciousness: Lordship and Bondage" is reprinted from G. W. F. Hegel, *The Phenomenology of Mind* (1807), translation by J. B. Baillie (1910).

The conception of this its unity in its duplication, of infinitude realizing itself in self-consciousness, has many sides to it and encloses within it elements of varied significance. Thus its moments must on the one hand be strictly kept apart in detailed distinctiveness, and, on the other, in this distinction must, at the same time, also be taken as not distinguished, or must always be accepted and understood in their opposite sense. This double meaning of what is distinguished lies in the nature of self-consciousness: of its being infinite, or directly the opposite of the determinateness in which it is fixed. The detailed exposition of the notion of this spiritual unity in its duplication will bring before us the process of Recognition.

Self-consciousness has before it another self-consciousness; it has come outside itself. This has a double significance. First it has lost its own self, since it finds itself as an *other* being; secondly, it has thereby sublated that other, for it does not regard the other as essentially real, but sees its own self in the other.

It must cancel this its other. To do so is the sublation of that first double meaning, and is therefore a second double meaning. First, it must set itself to sublate the other independent being, in order thereby to become certain of itself as true being, secondly, it thereupon proceeds to sublate its own self, for this other is itself.

This sublation in a double sense of its otherness in a double sense is at the same time a return in a double sense into its self. For, firstly, through sublation, it gets back itself, because it becomes one with itself again through the cancelling of *its* otherness; but secondly, it likewise gives otherness back again to the other self-consciousness, for it was aware of being in the other, it cancels this its own being in the other and thus lets the other again go free.

This process of self-consciousness in relation to another self-consciousness has in this manner been represented as the action of one alone. But this action on the part of the one has itself the double significance of being at once its own action and the action of that other as well. For the other is likewise independent, shut up within itself, and there is nothing in it which is not there through itself. The first does not have the object before it only in the passive form characteristic primarily of the object of desire, but as an object existing independently for itself, over which therefore it has no power to do anything for its own behalf, if that object does not *per se* do what the first does to it. The process then is absolutely the double process of both self-consciousnesses. Each sees the other do the same as itself; each itself does what it demands on the part of the other, and for that reason does what it does, only so far as the other does the same. Action from one side only would be useless, because what is to happen can only be brought about by means of both.

The action has then a *double entente* not only in the sense that it is an act done to itself as well as to the other, but also in the sense that the act *simpliciter is* the act of the one as well as of the other regardless of their distinction.

In this movement we see the process repeated which came before us as the play of forces; in the present case, however, it is found in consciousness. What in the former had effect only for us [contemplating experience], holds here for the terms themselves. The middle term is self-consciousness which breaks itself up into the extremes; and each extreme is this interchange of its own determinateness, and complete transition into the opposite. While *qua* consciousness, it no doubt comes outside itself, still, in being outside itself, it is at the same time restrained within itself, it exists for itself, and its self-externalization is for consciousness. *Consciousness* finds that it immediately is and is not another consciousness, as also that this other is for itself only when it cancels itself as existing for itself, and has self-existence only in the self-existence of the other. Each is the mediating term to the other, through which each mediates and unites itself with itself; and each is to itself and to the other an immediate self existing reality, which, at the same time, exists thus for itself only through this mediation. They recognize themselves as mutually recognizing one another.

This pure conception of recognition, of duplication of self-consciousness within its unity, we must now consider in the way its process appears for self-consciousness. It will, in the first place, present the aspect of the disparity of the two, or the break-up of the middle term into the extremes, which, *qua* extremes, are opposed to one another, and of which one is merely recognized, while the other only recognizes.

Self-consciousness is primarily simple existence for self, self-identity by exclusion of every other from itself. It takes its essential nature and absolute object to be Ego; and in this immediacy, in this bare fact of its self-existence, it is individual. That which for it is other stands as unessential object, as object with the impress and character of negation. But the other is also a self-consciousness; an individual makes its appearance in antithesis to an individual. Appearing thus in their immediacy, they are for each other in the manner of ordinary objects. They are independent individual forms, modes of Consciousness that have not risen above the bare level of life (for the existent object here has been determined as life). They are, moreover, forms of consciousness which have not yet accomplished for one another the process of absolute abstraction, of uprooting all immediate existence, and of being merely the bare, negative fact of self-identical consciousness; or, in other words, have not yet revealed themselves to each other as existing purely for themselves, i.e., as self-consciousness. Each is indeed certain of its own self, but not of the other, and hence its own certainty of itself is still without truth. For its truth would be merely that its own individual existence for itself would be shown to it to be an independent object, or, which is the same thing, that the object would be exhibited as this pure certainty of itself. By the notion of recognition, however, this is not possible, except in the form that as the other is for it, so it is for the other; each in its self through its own action and again through the action of the other achieves this pure abstraction of existence for self.

The presentation of itself, however, as pure abstraction of self-consciousness consists in showing itself as a pure negation of its objective form, or in showing that it is fettered to no determinate existence, that it is not bound at all by the particularity everywhere characteristic of existence as such, and is *not* tied up with life. The process of bringing all this out involves a twofold action—action on the part of the other and action on the part of itself. In so far as it is the other's action, each aims at the destruction and death of the other. But in this there is implicated also the second kind of action, self-activity; for the former implies that it risks its own life. The relation of both self-consciousnesses is in this way so constituted that they prove themselves and each other through a life-and-death struggle. They must enter into this struggle, for they must bring their certainty of themselves, the certainty of being for themselves, to the level of objective truth, and make this a fact both in the case of the other and in their own case as well. And it is solely by risking life that freedom is obtained; only thus is it tried and proved that the essential nature of self-consciousness is not bare existence, is not the merely immediate form in which it at first makes its appearance, is not its mere absorption in the expanse of life. Rather it is thereby guaranteed that there is nothing present but what might be taken as a vanishing moment—that self-consciousness is merely pure self-existence, being-for-self. The individual, who has not staked his life, may, no doubt, be recognized as a Person; but he has not attained the truth of this recognition as an independent self-consciousness. In the same way each must aim at the death of the other, as it risks its own life thereby; for that other is to it of no more worth than itself the other's reality is presented to the former as an external other, as outside itself; it must cancel that externality. The other is a purely existent consciousness and entangled in manifold ways; it must view its otherness as pure existence for itself or as absolute negation.

This trial by death, however, cancels both the truth which was to result from it, and therewith the certainty of self altogether. For just as life is the natural "position" of consciousness, independence without absolute negativity, so death is the natural "negation" of consciousness, negation without independence, which thus remains without the requisite significance of actual recognition. Through death, doubtless, there has arisen the certainty that both did stake their life, and held it lightly both in their own case and in the case of the other; but that is not for those who underwent this struggle. They cancel their consciousness which had its place in this alien element of natural existence; in other words, they cancel themselves and are sublated as terms or extremes seeking to have existence on their own account. But along with this there vanishes from the play of change the essential moment, viz. that of breaking up into extremes with opposite characteristics; and the middle term collapses into a lifeless unity which is broken up into lifeless extremes, merely existent and not opposed. And the two do not mutually give and receive one another back from each other through consciousness; they let one another go quite indifferently, like things. Their act is abstract negation, not the negation characteristic of consciousness, which cancels in such a way that it preserves and maintains what is sublated, and thereby survives its being sublated.

In this experience self-consciousness becomes aware that *life* is as essential to it as pure self-consciousness. In immediate self-consciousness the simple ego is absolute object, which, however, is for us or in itself absolute mediation, and has as its essential moment substantial and solid independence. The dissolution of that simple unity is the result of the first experience; through this there is posited a pure self-consciousness, and a consciousness which is not purely for itself, but for another, i.e. as an existent consciousness, consciousness in the form and shape of thinghood. Both moments are essential, since, in the first instance, they are unlike and opposed, and their reflexion into unity has not yet come to light, they stand as two opposed forms or modes of consciousness. The one is independent, and its essential nature is to be for itself; the other is dependent, and its essence is life or existence for another. The former is the Master, or Lord, the latter the Bondsman.

The master is the consciousness that exists *for itself;* but no longer merely the general notion of existence for self. Rather, it is a consciousness existing on its own account which is mediated with itself through an other consciousness, i.e. through an other whose very nature implies that it is bound up with an independent being or with thinghood in general. The master brings himself into relation to both these moments, to a thing as such, the object of desire, and to the consciousness whose essential character is thinghood. And since the master, is (*a*) *qua* notion of self-consciousness, an immediate relation of self-existence, but (*b*) is now moreover at the same time mediation, or a being-for-self which is for itself only through an other—he [the master] stands in relation (*a*) immediately to both (*b*) mediately to each through the other. The master relates himself to the bondsman mediately through independent existence, for that is precisely what keeps the bondsman in thrall; it is his chain, from which he could not in the struggle get away, and for that reason lie proved himself to be dependent, to have his independence in the shape of thinghood. The master, however, is the power controlling this state of existence, for he has shown in the struggle that he holds it to be merely something negative. Since he is the power dominating existence, while this existence again is the power controlling the other [the bondsman], the master holds, *par consequence*, this other in subordination. In the same way the master relates himself to the thing mediately through the bondsman. The bondsman being a self-consciousness in the broad sense, also takes up a negative attitude to things and cancels them; but the thing is, at the same time, independent for him and, in consequence, he cannot, with all his negating, get so far as to annihilate it outright and be done with it; that is to say, he merely works on it. To the master, on the other hand, by means of this mediating process, belongs the immediate relation, in the sense of the pure negation of it, in other words he gets the enjoyment. What mere desire did not attain, he now succeeds in attaining, viz. to have done with the thing, and find satisfaction in enjoyment. Desire alone did not get the length of this, because of the independence of the thing. The master, however, who has interposed the bondsman between it and himself, thereby relates himself merely to the dependence of the thing, and enjoys it without qualification and without reserve. The aspect of its independence he leaves to the bondsman, who labours upon it.

In these two moments, the master gets his recognition through an other consciousness, for in them the latter affirms itself as unessential, both by working upon the thing, and, on the other hand, by the fact of being dependent on a determinate existence; in neither case can this other get the mastery over existence, and succeed in absolutely negating it. We have thus here this moment of recognition, viz. that the other consciousness cancels itself as self-existent, and, *ipso facto,* itself does what the first does to it. In the same way we have the other moment, that this action on the part of the second is the action proper of the first; for what is done by the bondsman is properly an action on the part of the master. The latter exists only for himself, that is his essential nature; he is the negative power without qualification, a power to which the thing is naught. And he is thus the absolutely essential act in this situation, while the bondsman is not so, he is an unessential activity. But for recognition proper there is needed the moment that what the master does to the other he should also do to himself, and what the bondsman does to himself, he should do to the other also. On that account a form of recognition has arisen that is one sided and unequal.

In all this, the unessential consciousness is, for the master, the object which embodies the truth of his certainty of himself. But it is evident that this object does not correspond to its notion; for, just where the master has effectively achieved lordship, he really finds that something has come about quite different from an independent consciousness. It is not an independent, but rather a dependent consciousness that he has achieved. He is thus not assured of self-existence as his truth; he finds that his truth is rather the unessential consciousness, and the fortuitous unessential action of that consciousness.

The truth of the independent consciousness is accordingly the consciousness of the bondsman. This doubtless appears in the first instance outside itself, and not as the truth of self-consciousness. But just as lordship showed its essential nature to be the reverse of what it wants to be, so, too, bondage will, when completed, pass into the opposite of what it immediately is: being a consciousness repressed within itself, it will enter into itself, and change round into real and true independence.

We have seen what bondage is only in relation to lordship. But it is a self-consciousness, and we have now to consider what it is, in this regard, in and for itself. In the first instance, the master is taken to be the essential reality for the state of bondage; hence, for it, the truth is the independent consciousness existing for itself, although this truth is not taken yet as inherent in bondage itself. Still, it does in fact contain within itself this truth of pure negativity and self-existence, because it has experienced this reality within it. For this consciousness was not in peril and fear for this element or that, nor for this or that moment of time, it was afraid for its entire being; it felt the fear of death, the sovereign master. It has been in that experience melted to its inmost soul, has trembled throughout its every fibre, and all that was fixed and steadfast has quaked within it. This complete perturbation of its entire substance, this absolute dissolution of all its stability into fluent continuity, is, however, the simple, ultimate nature of self-consciousness, absolute negativity, pure self-referrent existence, which consequently is involved in this type of consciousness. This moment of pure self-existence is moreover a fact for it; for in the master it finds this as its object. Further, this bondsman's consciousness is not only this total dissolution in a general way; in serving and toiling the bondsman actually carries this out. By serving he cancels in every particular aspect his dependence on and attachment to natural existence, and by his work removes this existence away.

The feeling of absolute power, however, realized both in general and in the particular form of service, is only dissolution implicitly; and albeit the fear of the lord is the beginning of wisdom, consciousness is not therein aware of being self-existent. Through work and labour, however, this consciousness of the bondsman comes to itself. In the moment which corresponds to desire in the case of the master's consciousness, the aspect of the non-essential relation to the thing seemed to fall to the lot of the servant, since the thing there retained its independence. Desire has reserved to itself the pure negating of the object and thereby unalloyed feeling of self. This satisfaction, however, just for that reason is itself only a state of evanescence, for it lacks objectivity or subsistence. Labour, on the other hand, is desire restrained and checked, evanescence delayed and postponed; in other words, labour shapes and fashions the thing. The negative relation to the object passes into the form of the object, into something that is permanent and remains; because it is just for the labourer that the object has independence. This negative mediating agency, this activity giving shape and form, is at the same time the individual existence, the pure self-existence of that consciousness, which now in the work it does is externalized and passes into the condition of permanence. The consciousness that toils and serves accordingly attains by this means the direct apprehension of that independent being as its self.

But again, shaping or forming the object has not only the positive significance that the bondsman becomes thereby aware of himself as factually and objectively self-existent; this type of consciousness has also a negative import, in contrast with its moment, the element of fear. For in shaping the thing it only becomes aware of its own proper negativity, existence on its own account, as an object, through the fact that it cancels the actual form confronting it. But this objective negative element is precisely alien, external reality, before which it trembled. Now, however, it destroys this extraneous alien negative, affirms and sets itself up as a negative in the element of permanence, and thereby becomes for itself a self-existent being. In the master, the bondsman feels self-existence to be something external, an objective fact; in fear self-existence is present within himself; in fashioning the thing, self-existence comes to be felt explicitly as his own proper being, and he attains the consciousness that he himself exists in its own right and on its own account (*an und für sich*). By the fact that the form is objectified, it does not become something other than the consciousness moulding the thing through work; for just that form is his pure self existence, which therein becomes truly realized. Thus precisely in labour where there seemed to be merely some outsider's mind and ideas involved, the bondsman becomes aware, through this re-discovery of himself by himself, of having and being a "mind of his own."

For this reflexion of self into self the two moments, fear and service in general, as also that of formative activity, are necessary: and at the same time both must exist in a universal manner. Without the discipline of service and obedience, fear remains formal and does not spread over the whole known reality of existence. Without the formative activity shaping the thing, fear remains inward and mute, and consciousness does not become objective for itself. Should consciousness shape and form the thing without the initial state of absolute fear, then it has a merely vain and futile "mind of its own"; for its form or negativity is not negativity *per se*, and hence its formative activity cannot furnish the consciousness of itself as essentially real. If it has endured not absolute fear, but merely some slight anxiety, the negative reality has remained external to it, its substance has not been through and through infected thereby. Since the entire content of its natural consciousness has not tottered and shaken, it is still inherently a determinate mode of being; having a "mind of its own" (*der eigene Sinn*) is simply stubbornness (*Eigensinn*), a type of freedom which does not get beyond the attitude of bondage. As little as the pure form can become its essential nature, so little is that form, considered as extending over particulars, a universal formative activity, an absolute notion; it is rather a piece of cleverness which has mastery within a certain range, but not over the universal power nor over the entire objective reality.

Ralph Waldo Emerson

1803–1882

Emerson's well-known oration *The American Scholar* touches on three of his most important themes under the subject of education: nature, books, and action, in that order of importance. Throughout he draws a distinction between "man thinking" and man parroting "other men's thinking." In the section on books below, he considers both their proper use and their abuse. Education from books is second to that from nature and requires the exercise of the "active soul" of the reader lest the reader sink into passive acceptance and obeisance to "accepted dogmas," thus surrendering individuality.

In his essay *The Poet,* Emerson provides a compendium of Romantic ideas about poetry, though in *The American Scholar* he is critical of romanticism as he knows it. The poet acts out the human need for expression; the poet is the namer; the poet liberates us by means of invention. Language is poetic in origin. As in Vico (above, page 318) every word was originally a poem (Vico called the original word a myth), and ordinary language is thus "fossil poetry"; imagination involves sympathetic identification with all things, "the intellect being where and what it sees"; the country is ranged against the city; nature is itself a symbolic language.

According to Emerson, half of the reality of man is what he expresses, and ideally every man should be able to "report in conversation what has befallen him"; but language tends to wear itself out in clichés (see Shelley, above, page 539). Every thought eventually becomes a sort of prison. It is the poet who forges a refurbishment of language and provides the renewed possibility of mental liberation. In this view, poetic language would seem to constitute and reconstitute the real.

Emerson does not seem to have any theory of the poem as a whole; thought for him is prior to form; the poem is a transcendental thought. But his remarks about the "fluxional" nature of symbols and his criticism of symbols with fixed, univocal meanings are suggestive.

Since Emerson speaks of the poem as expressive of sympathetic identification, his notion of the poetic symbol seems to imply that it partakes of the reality it expresses, that it reaches out to blend with nature, a vehicle of secular communion. In this matter he contributes to a discussion of symbolism that engaged Goethe, Coleridge (above, page 519), Carlyle, Baudelaire, and many others.

Many collections of Emerson's writings are available, but see *Collected Works,* edited by Robert E. Spiller, et al. (1971–). See F. O. Matthiessen, *American Renaissance* (1941); R. L. Rusk, *The Life of Ralph Waldo Emerson* (1949); Sherman Paul, *Emerson's Angle of Vision* (1952); S. E. Whicher, *Freedom and Fate* (1953); Charles Feidelson, *Symbolism and American Literature* (1953); Jeffrey L. Duncan, *The Power and Form of Emerson's Thought* (1973); David D. Porter, *Emerson and Literary Change* (1978); B. L. Packer, *Emerson's Fall* (1982); David Van Leer, *Emerson's Epistemology* (1986); John Michael, *Emerson and Skepticism* (1988); Lawrence

from

The American Scholar

[Emerson has just discussed the primary importance of the education of the scholar offered by nature.]

II. The next great influence into the spirit of the scholar, is, the mind of the Past,—in whatever form, whether of literature, of art, of institutions, that mind is inscribed. Books are the best type of the influence of the past, and perhaps we shall get at the truth,—learn the amount of this influence more conveniently,—by considering their value alone.

The theory of books is noble. The scholar of the first age received into him the world around; brooded thereon; gave it the new arrangement of his own mind, and uttered it again. It came into him, life; it went out from him, truth. It came to him, short-lived actions; it went out from him, immortal thoughts. It came to him, business; it went from him, poetry. It was dead fact; now, it is quick thought. It can stand, and it can go. It now endures, it now flies, it now inspires. Precisely in proportion to the depth of mind from which it issued, so high does it soar, so long does it sing.

Or, I might say, it depends on how far the process had gone, of transmuting life into truth. In proportion to the completeness of the distillation, so will the purity and imperishableness of the product be. But none is quite perfect. As no air-pump can by any means make a perfect vacuum, so neither can any artist entirely exclude the conventional, the local, the perishable from his book, or write a book of pure thought, that shall be as efficient, in all respects, to a remote posterity, as to cotemporaries, or rather to the second age. Each age, it is found, must write its own books; or rather, each generation for the next succeeding. The books of an older period will not fit this.

Yet hence arises a grave mischief. The sacredness which attaches to the act of creation,—the act of thought,—is transferred to the record. The poet chanting, was felt to be a divine man: henceforth the chant is divine also. The writer was a just and wise spirit: henceforward it is settled, the book is perfect; as love of the hero corrupts into worship of his statue. Instantly, the book becomes noxious: the guide is a tyrant. The sluggish and perverted mind of the multitude, slow to open to the incursions of Reason, having once so opened, having once received this book, stands upon it, and makes an outcry, if it is disparaged. Colleges are built on it. Books are written on it by thinkers, not by Man Thinking; by men of talent, that is, who start wrong, who set out from accepted dogmas, not from their own sight of principles. Meek young men grow up in libraries, believing it their duty to accept the views, which Cicero, which Locke, which Bacon,[1] have given, forgetful that Cicero, Locke, and Bacon were only young men in libraries, when they wrote these books.

Hence, instead of Man Thinking, we have the bookworm. Hence, the book-learned class, who value books, as such; not as related to nature and the human constitution, but as making a sort of Third Estate with the world and the soul. Hence, the restores of readings, the emendators, the bibliomaniacs of all degrees.

Books are the best of things, well used; abused, among the worst. What is the right use? What is the one end, which all means go to effect? They are for nothing but to inspire. I had better never see a book, than to be warped by its attraction clean out of my own orbit, and made a satellite instead of a system. The one thing in the world, of value, is the active soul. This every man is entitled to; this every man contains within him, although, in almost all men, obstructed, and as yet unborn. The soul active sees absolute truth; and utters truth, or creates. In this action, it is genius; not the privilege of here and there a favorite, but the sound estate of every man. In its essence, it is progressive. The book, the college, the school of art, the institution of any kind, stop with some past utterance of genius. This is good, say they,—let us hold by this. They pin me down. They look backward and not forward. But genius looks forward: the eyes of man are set in his forehead, not in his hindhead: man hopes: genius creates. Whatever talents may be, if the man create not, the pure efflux of the Deity is not his;—cinders and smoke there may be, but not yet flame. There are

---

Emerson's *The American Scholar* was delivered before the Phi Beta Kappa Society at Cambridge, Mass., on August 31, 1837.

[1] Cicero (above, page 74), Locke (above, page 281), Bacon (above, page 234).

creative manners, there are creative actions, and creative words; manners, actions, words, that is, indicative of no custom or authority, but springing spontaneous from the mind's own sense of good and fair.

On the other part, instead of being its own seer, let it receive from another mind its truth, though it were in torrents of light, without periods of solitude, inquest, and self-recovery, and a fatal disservice is done. Genius is always sufficiently the enemy of genius by over influence. The literature of every nation bear me witness. The English dramatic poets have Shakspearized now for two hundred years.

Undoubtedly there is a right way of reading, so it be sternly subordinated. Man Thinking must not be subdued by his instruments. Books are for the scholar's idle times. When he can read God directly, the hour is too precious to be wasted in other men's transcripts of their readings. But when the intervals of darkness come, as come they must,—when the sun is hid, and the stars withdraw their shining,—we repair to the lamps which were kindled by their ray, to guide our steps to the East again, where the dawn is. We hear, that we may speak. The Arabian proverb says, "A fig tree, looking on a fig tree, becometh fruitful."

It is remarkable, the character of the pleasure we derive from the best books. They impress us with the conviction, that one nature wrote and the same reads. We read the verses of one of the great English poets, of Chaucer, of Marvell, of Dryden,[2] with the most modern joy,—with a pleasure, I mean, which is in great part caused by the abstraction of all *time* from their verses. There is some awe mixed with the joy of our surprise, when this poet, who lived in some past world, two or three hundred years ago, says that which lies close to my own soul, that which I also had wellnigh thought and said. But for the evidence thence afforded to the philosophical doctrine of the identity of all minds, we should suppose some preëstablished harmony, some foresight of souls that were to be, and some preparation of stores for their future wants, like the fact observed in insects, who lay up food before death for the young grub they shall never see.

I would not be hurried by any love of system, by any exaggeration of instincts, to underrate the Book. We all know, that, as the human body can be nourished on any food, though it were boiled grass and the broth of shoes, so the human mind can be fed by any knowledge. And great and heroic men have existed, who had almost no other information than by the printed page. I only would say, that it needs a strong head to bear that diet. One must be an inventor to read well. As the proverb says, "He that would bring home the wealth of the Indies, must carry out the wealth of the Indies." There is then creative reading as well as creative writing. When the mind is braced by labor and invention, the page of whatever book we read becomes luminous with manifold allusion. Every sentence is doubly significant, and the sense of our author is as broad as the world. We then see, what is always true, that, as the seer's hour of vision is short and rare among heavy days and months, so is its record, perchance, the least part of his volume. The discerning will read, in his Plato or Shakspeare, only that least part,—only the authentic utterances of the oracle;—all the rest he rejects, were it never so many times Plato's and Shakspeare's.

Of course, there is a portion of reading quite indispensable to a wise man. History and exact science he must learn by laborious reading. Colleges, in like manner, have their indispensable office,—to teach elements. But they can only highly serve us, when they aim not to drill, but to create; when they gather from far every ray of various genius to their hospitable halls, and, by the concentrated fires, set the hearts of their youth on flame. Thought and knowledge are natures in which apparatus and pretension avail nothing. Gowns, and pecuniary foundations, though of towns of gold, can never countervail the least sentence or syllable of wit. Forget this, and our American colleges will recede in their public importance, whilst they grow richer every year.

* * *

[Emerson proceeds here to discuss action, which for the scholar is "subordinate," but "essential."]

I have now spoken of the education of the scholar by nature, by books, and by action. It remains to say somewhat of his duties.

They are such as become Man Thinking. They may all be comprised in self-trust. The office of the scholar is to cheer, to raise, and to guide men by showing them facts amidst appearances. He plies the slow, unhonored, and unpaid task of observation. Flamsteed and Herschel,[3] in their glazed observatories, may catalogue the stars with the praise of all men, and, the results being splendid and useful, honor is sure. But he, in his private observatory, cataloguing obscure and nebulous stars of the human mind, which as yet no man has thought of as such,—watching days and months, sometimes, for a few facts; correcting still his old records;—must relinquish display and immediate fame. In the long period of his preparation, he must betray often an ignorance and shiftlessness in popular arts, incurring the disdain of the able who shoulder him aside. Long he must stammer in his speech; often forego the living for the dead. Worse yet, he must accept,—how often! poverty and solitude. For the ease and pleasure of treading the old road, accepting the fashions, the education, the religion of society, he takes the cross of making his own, and, of course, the self-accusation, the faint heart, the frequent uncertainty and loss of time, which are the nettles and tangling vines in the way of the self-relying and self-directed; and the state of virtual hostility in which he seems to stand to society, and especially to educated society. For all this loss and scorn, what offset? He is to find consolation in exercising the highest functions of human nature. He is one, who raises himself from private considerations, and breathes and lives on public and illustrious thoughts. He is the world's eye. He is the world's heart. He is to resist the vulgar prosperity that retrogrades ever to barbarism, by preserving and communicating heroic sentiments, noble biographies, melodious verse, and the conclusions of history. Whatsoever oracles the human heart, in all emergencies, in all solemn hours, has uttered as its commentary on the world of actions,—these he shall receive and impart. And whatsoever new verdict Reason from her inviolable seat pronounces on the passing men and events of to-day,—this he shall hear and promulgate.

---

[2] Geoffrey Chaucer (1340?–1400), Andrew Marvell (1621–1678), Dryden (above, page 253), English poets.

[3] John Flamsteed (1646–1719) and John F. W. Herschel (1738–1822), English astronomers.

These being his functions, it becomes him to feel all confidence in himself, and to defer never to the popular cry. He and he only knows the world. The world of any moment is the merest appearance. Some great decorum, some fetish of a government, some ephemeral trade, or war, or man, is cried up by half mankind and cried down by the other half, as if all depended on this particular up or down. The odds are that the whole question is not worth the poorest thought which the scholar has lost in listening to the controversy. Let him not quit his belief that a popgun is a popgun, though the ancient and honorable of the earth affirm it to be the crack of doom. In silence, in steadiness, in severe abstraction, let him hold by himself; add observation to observation, patient of neglect, patient of reproach; and bide his own time,—happy enough, if he can satisfy himself alone, that this day he has seen something truly. Success treads on every right step. For the instinct is sure, that prompts him to tell his brother what he thinks. He then learns, that in going down into the secrets of his own mind, he has descended into the secrets of all minds. He learns that he who has mastered any law in his private thoughts, is master to that extent of all men whose language he speaks, and of all into whose language his own can be translated. The poet, in utter solitude remembering his spontaneous thoughts and recording them, is found to have recorded that, which men in crowded cities find true for them also. The orator distrusts at first the fitness of his frank confessions,—his want of knowledge of the persons he addresses,—until he finds that he is the complement of his hearers;—that they drink his words because he fulfills for them their own nature; the deeper he dives into his privatest, secretest presentiment, to his wonder he finds, this is the most acceptable, most public, and universally true. The people delight in it; the better part of every man feels, This is my music; this is myself.

* * *

I read with joy some of the auspicious signs of the coming days, as they glimmer already through poetry and art, through philosophy and science, through church and state.

One of these signs is the fact, that the same movement which effected the elevation of what was called the lowest class in the state, assumed in literature a very marked and as benign an aspect. Instead of the sublime and beautiful; the near, the low, the common, was explored and poetized. That, which had been negligently trodden under foot by those who were harnessing and provisioning themselves for long journeys into far countries, is suddenly found to be richer than all foreign parts. The literature of the poor, the feelings of the child, the philosophy of the street, the meaning of household life, are the topics of the time. It is a great stride. It is a sign,—is it not? of new vigor, when the extremities are made active, when currents of warm life run into the hands and the feet. I ask not for the great, the remote, the romantic; what is doing in Italy or Arabia; what is Greek art, or Provençal minstrelsy; I embrace the common, I explore and sit at the feet of the familiar, the low. Give me insight into to-day, and you may have the antique and future worlds. What would we really know the meaning of? The meal in the firkin; the milk in the pan; the ballad in the street; the news of the boat; the glance of the eye; the form and the gait of the body;—show me the ultimate reason of these matters; show me the sublime presence of the highest spiritual cause lurking, as always it does lurk, in these suburbs and extremities of nature; let me see every trifle bristling with the polarity that ranges it instantly on an eternal law; and the shop, the plough, and the leger, referred to the like cause by which light undulates and poets sing;—and the world lies no longer a dull miscellany and lumber-room, but has form and order; there is no trifle; there is no puzzle; but one design unites and animates the farthest pinnacle and the lowest trench.

* * *

Another sign of our times, also marked by an analogous political movement, is, the new importance given to the single person. Every thing that tends to insulate the individual,—to surround him with barriers of natural respect, so that each man shall feel the world is his, and man shall treat with man as a sovereign state with a sovereign state;—tends to true union as well as greatness. "I learned," said the melancholy Pestalozzi,[4] "that no man in God's wide earth is either willing or able to help any other man." Help must come from the bosom alone. The scholar is that man who must take up into himself all the ability of the time, all the contributions of the past, all the hopes of the future. He must be an university of knowledges. If there be one lesson more than another, which should pierce his ear, it is, The world is nothing, the man is all; in yourself is the law of all nature, and you know not yet how a globule of sap ascends; in yourself slumbers the whole of Reason; it is for you to know all, it is for you to dare all.

* * *

The Poet

A moody child and wildly wise
Pursued the game with joyful eyes,
Which chose, like meteors, their way,
And rived the dark with private ray:
They overleapt the horizon's edge,
Searched with Apollo's privilege;
Through man, and woman, and sea, and star
Saw the dance of nature forward far;
Through worlds, and races, and terms, and times
Saw musical order, and pairing rhymes.[1]

* * *

Olympian bards who sung
    Divine ideas below,
Which always find us young,
    And always keep us so.[2]

Those who are esteemed umpires of taste are often persons who have acquired some knowledge of admired pictures or sculptures, and have an inclination for whatever is elegant; but if you inquire whether they are beautiful souls, and whether their own acts are like fair pictures, you learn that they are selfish and sensual. Their cultivation is local, as if you should rub a log of dry wood in one spot to produce fire, all the rest remaining cold. Their knowledge of the fine arts is some study of rules and particulars, or some limited judgment of color or form, which is exercised for amusement or for show. It is a proof of the shallowness of the doctrine of beauty as it lies in the minds of our amateurs, that men seem to have lost the perception of the instant dependence of form upon soul. There is no doctrine of forms in our philosophy. We were put into our bodies, as fire is put into a pan to be carried about; but there is no accurate adjustment between the spirit and the organ, much less is the latter the germination of the former. So in regard to other forms, the intellectual men do not believe in any essential dependence of the material world on thought and volition. Theologians think it a pretty air-castle to talk of the spiritual meaning of a ship or a cloud, of a city or a contract, but they prefer to come again to the solid ground of historical evidence; and even the poets are contented with a civil and conformed manner of living, and to write poems from the fancy, at a safe distance from their own experience. But the highest minds of the world have never ceased to explore the double meaning, or shall I say the quadruple or the centuple or much more manifold meaning, of every sensuous fact; Orpheus, Empedocles, Heraclitus, Plato, Plutarch, Dante, Swedenborg,[3] and the masters of sculpture, picture and poetry. For we are not pans and barrows, nor even porters of the fire and torch-bearers, but children of the fire, made of it, and only the same divinity transmuted and at two or three removes, when we know least about it. And this hidden truth, that the fountains whence all this river of time and its creatures floweth are intrinsically ideal and beautiful, draws us to the consideration of the nature and functions of the poet, or the man of beauty; to the means and materials he uses, and to the general aspect of the art in the present time.

The breadth of the problem is great, for the poet is representative. He stands among partial men for the complete man, and apprises us not of his wealth, but of the common wealth. The young man reveres men of genius, because, to speak truly, they are more himself than he is. They receive of the soul as he also receives, but they more. Nature enhances her beauty, to the eye of loving men, from their belief that the poet is beholding her shows at the same time.

---

[4] Johann Heinrich Pestalozzi (1746–1827), Swiss educational reformer.

The Poet was written in 1842–1843 and first published in 1844.

[1] Lines by Emerson, revised from his poem *The Poet.*

[2] Emerson, *Ode to Beauty,* 60–63.

[3] Orpheus, legendary ancient Greek poet; Empedocles (c. 495–c. 435 B.C.), Greek philosopher; Heraclitus (c. 535–c. 475 B.C.), Greek philosopher; Plato (above, page 8); Plutarch (above, page 119); Dante (above, page 153); *Emanuel Swedenborg (1688–1772), Swedish scientist and mystical* theologian.

He is isolated among his contemporaries by truth and by his art, but with this consolation in his pursuits, that they will draw all men sooner or later. For all men live by truth and stand in need of expression. In love, in art, in avarice, in politics, in labor, in games, we study to utter our painful secret. The man is only half himself, the other half is his expression.[4]

Notwithstanding this necessity to be published, adequate expression is rare. I know not how it is that we need an interpreter, but the great majority of men seem to be minors, who have not yet come into possession of their own, or mutes, who cannot report the conversation they have had with nature. There is no man who does not anticipate a super-sensual utility in the sun and stars, earth and water. These stand and wait to render him a peculiar service. But there is some obstruction or some excess of phlegm in our constitution, which does not suffer them to yield the due effect. Too feeble fall the impressions of nature on us to make us artists. Every touch should thrill. Every man should be so much an artist that he could report in conversation what had befallen him. Yet, in our experience, the rays or appulses have sufficient force to arrive at the senses, but not enough to reach the quick and compel the reproduction of themselves in speech. The poet is the person in whom these powers are in balance, the man without impediment, who sees and handles that which others dream of, traverses the whole scale of experience, and is representative of man, in virtue of being the largest power to receive and to impart.

For the universe has three children, born at one time, which reappear under different names in every system of thought, whether they be called cause, operation and effect; or, more poetically, Jove, Pluto, Neptune; or, theologically, the Father, the Spirit and the Son; but which we will call here the Knower, the Doer and the Sayer. These stand respectively for the love of truth, for the love of good, and for the love of beauty. These three are equal. Each is that which he is, essentially, so that he cannot be surmounted or analyzed, and each of these three has the power of the others latent in him and his own, patent.

The poet is the sayer, the namer, and represents beauty. He is a sovereign, and stands on the center. For the world is not painted or adorned, but is from the beginning beautiful; and God has not made some beautiful things, but beauty is the creator of the universe. Therefore the poet is not any permissive potentate, but is emperor in his own right. Criticism is infested with a cant of materialism, which assumes that manual skill and activity is the first merit of all men, and disparages such as say and do not, overlooking the fact that some men, namely poets, are natural sayers, sent into the world to the end of expression, and confounds them with those whose province is action but who quit it to imitate the sayers. But Homer's words are as costly and admirable to Homer as Agamemnon's victories are to Agamemnon. The poet does not wait for the hero or the sage, but, as they act and think primarily, so he writes primarily what will and must be spoken, reckoning the others, though primaries also, yet, in respect to him, secondaries and servants; as sitters or models in the studio of a painter, or as assistants who bring building materials to an architect.

For poetry was all written before time was, and whenever we are so finely organized that we can penetrate into that region where the air is music, we hear those primal warblings and attempt to write them down, but we lose ever and anon a world or a verse and substitute something of our own, and thus miswrite the poem. The men of more delicate ear write down these cadences more faithfully, and these transcripts, though imperfect, become the songs of the nations. For nature is as truly beautiful as it is good, or as it is reasonable, and must as much appear as it must be done, or be known. Words and deeds are quite indifferent modes of the divine energy. Words are also actions, and actions are a kind of words.

The sign and credentials of the poet are that he announces that which no man foretold. He is the true and only doctor;[5] he knows and tells; he is the only teller of news, for he was present and privy to the appearance which he describes. He is a beholder of ideas and an utterer of the necessary and causal. For we do not speak now of men of poetical talents, or of industry and skill in meter, but of the true poet. I took part in a conversation the other day concerning a recent writer of lyrics, a man of subtle mind, whose head appeared to be a music box of delicate tunes and rhythms, and whose skill and command of language we could not sufficiently praise. But when the question arose whether he was not only a lyrist but a poet, we were obliged to confess that he is plainly a contemporary, not an eternal man. He does not stand out of our low limitations, like a Chimborazo[6] under the line, running up from a torrid base through all the climates of the globe, with belts of the herbage of every latitude on its high and mottled sides; but this genius is the landscape garden of a modern house, adorned with fountains and statues, with well-bred men and women standing and sitting in the walks and terraces. We hear, through all the varied music, the ground tone of conventional life. Our poets are men of talents who sing, and not the children of music. The argument is secondary, the finish of the verses is primary.

---

[4] The close identification of poem and poet is a common Romantic notion (see, for example, Wordsworth [above, page 486] and Coleridge [above, page 507]). Indeed, it is a Romantic invention.

[5] Teacher.

[6] Andean volcanic mountain.

For it is not meters, but a meter-making argument that makes a poem—a thought so passionate and alive that like the spirit of a plant or an animal it has an architecture of its own, and adorns nature with a new thing. The thought and the form are equal in the order of time, but in the order of genesis the thought is prior to the form.[7] The poet has a new thought; he has a whole new experience to unfold; he will tell us how it was with him, and all men will be the richer in his fortune. For the experience of each new age requires a new confession, and the world seems always waiting for its poet. I remember when I was young how much I was moved one morning by tidings that genius had appeared in a youth who sat near me at table. He had left his work and gone rambling none knew whither, and had written hundreds of lines, but could not tell whether that which was in him was therein told; he could tell nothing but that all was changed—man, beast, heaven, earth and sea. How gladly we listened! How credulous! Society seemed to be compromised. We sat in the aurora of a sunrise which was to put out all the stars. Boston seemed to be at twice the distance it had the night before, or was much farther than that. Rome—what was Rome? Plutarch and Shakespeare were in the yellow leaf, and Homer no more should be heard of. It is much to know that poetry has been written this very day, under this very roof, by your side. What! That wonderful spirit has not expired! These stony moments are still sparkling and animated! I had fancied that the oracles were all silent, and nature had spent her fires; and behold! all night, from every pore, these fine auroras have been streaming. Everyone has some interest in the advent of the poet, and no one knows how much it may concern him. We know that the secret of the world is profound, but who or what shall be our interpreter, we know not. A mountain ramble, a new style of face, a new person, may put the key into our hands. Of course the value of genius to us is in the veracity of its report. Talent may frolic and juggle; genius realizes and adds. Mankind in good earnest have availed so far in understanding themselves and their work, that the foremost watchman on the peak announces his news. It is the truest word ever spoken, and the phrase will be the fittest, most musical, and the unerring voice of the world for that time.

All that we call sacred history attests that the birth of a poet is the principal event in chronology. Man, never so often deceived, still watches for the arrival of a brother who can hold him steady to a truth until he has made it his own. With what joy I begin to read a poem which I confide in as an inspiration! And now my chains are to be broken; I shall mount above these clouds and opaque airs in which I live—opaque, though they seem transparent—and from the heaven of truth I shall see and comprehend my relations. That will reconcile me to life and renovate nature, to see trifles animated by a tendency, and to know what I am doing. Life will no more be a noise; now I shall see men and women, and know the signs by which they may be discerned from fools and satans. This day shall be better than my birthday: then I became an animal; now I am invited into the science of the real. Such is the hope, but the fruition is postponed. Oftener it falls that this winged man, who will carry me into the heaven, whirls me into mists, then leaps and frisks about with me as it were from cloud to cloud, still affirming that he is bound heavenward; and I, being myself a novice, am slow in perceiving that he does not know the way into the heavens, and is merely bent that I should admire his skill to rise like a fowl or a flying fish, a little way from the ground or the water; but the all-piercing, all-feeding and ocular air of heaven that man shall never inhabit. I tumble down again soon into my old nooks, and lead the life of exaggerations as before, and have lost my faith in the possibility of any guide who can lead me thither where I would be.

But, leaving these victims of vanity, let us, with new hope, observe how nature, by worthier impulses, has insured the poet's fidelity to his office of announcement and affirming, namely by the beauty of things, which becomes a new and higher beauty when expressed. Nature offers all her creatures to him as a picture language. Being used as a type, a second wonderful value appears in the object, far better than its old value; and the carpenter's stretched cord, if you hold your ear close enough, is musical in the breeze. "Things more excellent than every image," says Iamblichus, "are expressed through images."[8] Things admit of being used as symbols because nature is a symbol, in the whole, and in every part. Every line we can draw in the sand has expression; and there is no body without its spirit or genius. All form is an effect of character; all condition, of the quality of the life; all harmony, of health; and for this reason a perception of beauty should be sympathetic, or proper only to the good. The beautiful rests on the foundations of the necessary. The soul makes the body, as the wise Spenser teaches:

---

[7] Emerson agrees with Shelley (above, page 549) on this point and not with Blake (above, page 448) and but partially with Benedetto Croce (*Aesthetic*, 1900), who identified intuition with expression but added the notion of externalization of the intuition-expression in the material form of the artwork.

[8] Iamblichus, (third to fourth century), neoplatonic philosopher.

> So every spirit, as it is more pure,
> And hath in it the more of heavenly light,
> So it the fairer body doth procure
> To habit in, and it more fairly dight,
> With cheerful grace and amiable sight.
> For, of the soul, the body form doth take,
> For soul is form, and doth the body make.[9]

Here we find ourselves suddenly not in a critical speculation but in a holy place, and should go very warily and reverently. We stand before the secret of the world, there where being passes into appearance and unity into variety.

The universe is the externization of the soul. Wherever the life is, that bursts into appearance around it. Our science is sensual, and therefore superficial. The earth and the heavenly bodies, physics and chemistry, we sensually treat, as if they were self-existent; but these are the retinue of that being we have. "The mighty heaven," said Proclus, "exhibits, in its transfigurations, clear images of the splendor of intellectual perceptions; being moved in conjunction with the unapparent periods of intellectual natures."[10] Therefore science always goes abreast with the just elevation of the man, keeping step with religion and metaphysics; or the state of science is an index of our self-knowledge. Since everything in nature answers to a moral power, if any phenomenon remains brute and dark it is because the corresponding faculty in the observer is not yet active.

No wonder then, if these waters be so deep, that we hover over them with a religious regard. The beauty of the fable proves the importance of the sense; to the poet, and to all others; or, if you please, every man is so far a poet as to be susceptible of these enchantments of nature; for all men have the thoughts whereof the universe is the celebration. I find that the fascination resides in the symbol. Who loves nature? Who does not? Is it only poets, and men of leisure and cultivation, who live with her? No; but also hunters, farmers, grooms and butchers, though they express their affection in their choice of life and not in their choice of words. The writer wonders what the coachman or the hunter values in riding, in horses and dogs. It is not superficial qualities. When you talk with him he holds these at as slight a rate as you. His worship is sympathetic; he has no definitions, but he is commanded in nature by the living power which he feels to be there present. No imitation or playing of these things would content him; he loves the earnest of the north wind, of rain, of stone and wood and iron. A beauty not explicable is dearer than a beauty which we can see to the end of. It is nature the symbol, nature certifying the supernatural, body overflowed by life which he worships with coarse but sincere rites.

The inwardness and mystery of this attachment drive men of every class to the use of emblems. The schools of poets and philosophers are not more intoxicated with their symbols than the populace with theirs. In our political parties, compute the power of badges and emblems. See the great ball which they roll from Baltimore to Bunker Hill! In the political processions, Lowell goes in a loom, and Lynn in a shoe, and Salem in a ship. Witness the cider barrel, the log cabin, the hickory stick, the palmetto, and all the cognizances of party. See the power of national emblems. Some stars, lilies, leopards, a crescent, a lion, an eagle, or other figure which came into credit God knows how, on an old rag of bunting, blowing in the wind on a fort at the ends of the earth, shall make the blood tingle under the rudest or the most conventional exterior. The people fancy they hate poetry, and they are all poets and mystics!

Beyond this universality of the symbolic language, we are apprised of the divineness of this superior use of things, whereby the world is a temple whose walls are covered with emblems, pictures and commandments of the Deity—in this, that there is no fact in nature which does not carry the whole sense of nature; and the distinctions which we make in events and in affairs, of low and high, honest and base, disappear when nature is used as a symbol.[11] Thought makes everything fit for use. The vocabulary of an omniscient man would embrace words and images excluded from polite conversation. What would be base, or even obscene, to the obscene, becomes illustrious, spoken in a new connection of thought. The piety of the Hebrew prophets purges their grossness. The circumcision is an example of the power of poetry to raise the low and offensive. Small and mean things serve as well as great symbols. The meaner the type by which a law is expressed, the more pungent it is, and the more lasting in the memories of men; just as we choose the smallest box or case in which any needful utensil can be carried. Bare lists of words are found suggestive to an imaginative and excited mind, as it is related of Lord Chatham that he was accustomed to read in Bailey's Dictionary when he was preparing to speak in Parliament.[12] The poorest experience is rich enough for all the purposes of expressing thought. Why covet a knowledge of new facts? Day and night, house and garden, a few books, a few actions, serve us as well as would all trades and all spectacles. We are far from having exhausted the significance of the few symbols we use. We can come to use them yet with a terrible simplicity. It does not need that a poem should be long. Every word was once a poem.[13] Every new relation is a new word. Also we use defects and deformities to a sacred purpose, so expressing our sense that the evils of the world are such only to the evil eye. In the old mythology, mythologists observe, defects are ascribed to divine natures, as lameness to Vulcan, blindness to Cupid, and the like—to signify exuberances.

---

[9] *A Hymn in Honor of Beauty* XIX, 127–34.

[10] Proclus (410?–485), neoplatonic philosopher.

[11] Compare Baudelaire's sonnet *Correspondences*.

For as it is dislocation and detachment from the life of God that makes things ugly, the poet, who reattaches things to nature and the whole—reattaching even artificial things and violation of nature, to nature, by a deeper insight—disposes very easily of the most disagreeable facts. Readers of poetry see the factory village and the railway, and fancy that the poetry of the landscape is broken up by these; for these works of art are not yet consecrated in their reading; but the poet sees them fall within the great order not less than the beehive or the spider's geometrical web. Nature adopts them very fast into her vital circles, and the gliding train of cars she loves like her own. Besides, in a centered mind, it signifies nothing how many mechanical inventions you exhibit. Though you add millions, and never so surprising, the fact of mechanics has not gained a grain's weight. The spiritual fact remains unalterable, by many or by few particulars; as no mountain is of any appreciable height to break the curve of the sphere. A shrewd country boy goes to the city for the first time, and the complacent citizen is not satisfied with his little wonder. It is not that he does not see all the fine houses and know that he never saw such before, but he disposes of them as easily as the poet finds place for the railway. The chief value of the new fact is to enhance the great and constant fact of life, which can dwarf any and every circumstance, and to which the belt of wampum and the commerce of America are alike.

The world being thus put under the mind for verb and noun, the poet is he who can articulate it. For though life is great, and fascinates and absorbs; and though all men are intelligent of the symbols through which it is named; yet they cannot originally use them. We are symbols and inhabit symbols; workmen, work, and tools, words and things, birth and death, all are emblems; but we sympathize with the symbols, and being infatuated with the economical uses of things, we do not know that they are thoughts. The poet, by an ulterior intellectual perception, gives them a power which makes their old use forgotten, and puts eyes and a tongue into every dumb and inanimate object. He perceives the independence of the thought on the symbol, the stability of the thought, the accidency and fugacity of the symbol. As the eyes of Lyncaeus were said to see through the earth, so the poet turns the world to glass, and shows us all things in their right series and procession. For through that better perception he stands one step nearer to things, and sees the flowing or metamorphosis; perceives that thought is multiform; that within the form of every creature is a force impelling it to ascend into a higher form; and following with his eyes the life, uses the forms which express that life, and so his speech flows with the flowing of nature. All the facts of the animal economy, sex, nutriment, gestation, birth, growth, are symbols of the passage of the world into the soul of man, to suffer there a change and reappear a new and higher fact. He uses forms according to the life, and not according to the form. This is true science. The poet alone knows astronomy, chemistry, vegetation and animation, for he does not stop at these facts, but employs them as signs. He knows why the plain or meadow of space was strown with these flowers we call suns and moons and stars; why the great deep is adorned with animals, with men, and gods; for in every word he speaks he rides on them as the horses of thought.

By virtue of this science the poet is the namer or language-maker, naming things sometimes after their appearance, sometimes after their essence, and giving to every one its own name and not another's, thereby rejoicing the intellect, which delights in detachment or boundary. The poets made all the words, and therefore language is the archives of history, and, if we must say it, a sort of tomb of the Muses. For though the origin of most of our words is forgotten, each word was at first a stroke of genius, and obtained currency because for the moment it symbolized the world to the first speaker and to the hearer. The etymologist finds the deadest word to have been once a brilliant picture. Language is fossil poetry. As the limestone of the continent consists of infinite masses of the shells of animalcules, so language is made up of images or tropes, which now, in their secondary use, have long ceased to remind us of their poetic origin.[14] But the poet names the thing because he sees it, or comes one step nearer to it than any other. This expression or naming is not art, but a second nature, grown out of the first, as a leaf out of a tree. What we call nature is a certain self-regulated motion or change; and nature does all things by her own hands, and does not leave another to baptize her but baptizes herself; and this through the metamorphosis again. I remember that a certain poet described it to me thus: "Genius is the activity which repairs the decays of things, whether wholly or partly of a material and finite kind. Nature, through all her kingdoms, insures herself. Nobody cares for planting the poor fungus; so she shakes down from the gills of one agaric countless spores, any one of which, being preserved, transmits new billions of spores tomorrow or next day. The new agaric of this hour has a chance which the old one had not. This atom of seed is thrown into a new place, not subject to the accidents which destroyed its parent two rods off. She makes a man; and having brought him to ripe age, she will no longer run the risk of losing this wonder at a blow, but she detaches from him a new self, that the kind may be safe from accidents to which the individual is exposed. So when the soul of the poet has come to ripeness of thought, she detaches and sends away from it its poems or songs—a fearless, sleepless, deathless progeny, which is not exposed to the accidents of the weary kingdom of time; a fearless, vivacious offspring, clad with wings (such was the virtue of the soul out of which they came) which carry them fast and far, and infix them irrecoverably into the hearts of men. These wings are the beauty of the poet's soul. The songs, thus flying immortal from their mortal parent, are pursued by clamorous flights of censures, which swarm in far greater numbers and threaten to devour them; but these last are not winged. At the end of a very short leap they fall plump down and rot, having received from the souls out of which they came no beautiful wings. But the melodies of the poet ascend and leap and pierce into the deeps of infinite time."

---

[12] William Pitt, first Earl of Chatham (1708–1778). Nathan Bailey published two dictionaries (1721, 1730).

[13] Compare Vico (above, page 317).

[14] Compare Shelley (above, page 539).

So far the bard taught me, using his freer speech. But nature has a higher end, in the production of new individuals, than security, namely *ascension,* or the passage of the soul into higher forms. I knew in my younger days the sculptor who made the statue of the youth which stands in the public garden. He was, as I remember, unable to tell directly what made him happy or unhappy, but by wonderful indirections he could tell. He rose one day, according to his habit, before the dawn, and saw the morning break, grand as the eternity out of which it came, and for many days after, he strove to express this tranquility, and lo! His chisel had fashioned out of marble the form of a beautiful youth, Phosphorus, whose aspect is such that it is said all persons who look on it become silent. The poet also resigns himself to his mood, and that thought which agitated him is expressed, but *alter idem,*[15] in a manner totally new. The expression is organic, or the new type which things themselves take when liberated. As, in the sun, objects paint their images on the retina of the eye, so they, sharing the aspiration of the whole universe, tend to paint a far more delicate copy of their essence in his mind. Like the metamorphosis of things into higher organic forms is their change into melodies. Over everything stands its demon or soul, and, as the form of the thing is reflected by the eye, so the soul of the thing is reflected by a melody. The sea, the mountain ridge, Niagara, and every flowerbed, preexist, or superexist, in precantations, which sail like odors in the air, and when any man goes by with an ear sufficiently fine, he overhears them and endeavors to write down the notes without diluting or depraving them. And herein is the legitimation of criticism, in the mind's faith that the poems are a corrupt version of some text in nature with which they ought to be made to tally. A rhyme in one of our sonnets should not be less pleasing than the iterated nodes of a seashell, or the resembling difference of a group of flowers. The pairing of the birds is an idyl, not tedious as our idyls are; a tempest is a rough ode, without falsehood or rant; a summer, with its harvest sown, reaped and stored, is an epic song, subordinating how many admirably executed parts. Why should not the symmetry and truth that modulate these, glide into our spirits, and we participate the invention of nature?

This insight, which expresses itself by what is called imagination, is a very high sort of seeing, which does not come by study, but by the intellect being where and what it sees; by sharing the path or circuit of things through forms, and so making them translucid to others. The path of things is silent. Will they suffer a speaker to go with them? A spy they will not suffer; a lover, a poet, is the transcendency of their own nature—him they will suffer. The condition of true naming, on the poet's part, is his resigning himself to the divine aura which breathes through forms, and accompanying that.

It is a secret which every intellectual man quickly learns, that beyond the energy of his possessed and conscious intellect he is capable of a new energy (as of an intellect doubled on itself), by abandonment to the nature of things; that beside his privacy of power as an individual man, there is a great public power on which he can draw, by unlocking, at all risks, his human doors, and suffering the ethereal tides to roll and circulate through him; then he is caught up into the life of the universe, his speech is thunder, his thought is law, and his words are universally intelligible as the plants and animals. The poet knows that he speaks adequately then only when he speaks somewhat wildly, or "with the flower of the mind"; not with the intellect used as an organ, but with the intellect released from all service and suffered to take its direction from its celestial life, or as the ancients were wont to express themselves, not with intellect alone but with the intellect inebriated by nectar. As the traveler who has lost his way throws his reins on his horse's neck and trusts to the instinct of the animal to find his road, so must we do with the divine animal who carries us through this world. For if in any manner we can stimulate this instinct, new passages are opened for us into nature; the mind flows into and through things hardest and highest, and the metamorphosis is possible.

---

[15] "Same and different."

This is the reason why bards love wine, mead, narcotics, coffee, tea, opium, the fumes of sandalwood and tobacco, or whatever other procurers of animal exhilaration. All men avail themselves of such means as they can, to add this extraordinary power to their normal powers; and to this end they prize conversation, music, pictures, sculpture, dancing, theaters, traveling, war, mobs, fires, gaming, politics, or love, or science, or animal intoxication—which are several coarser or finer quasi-mechanical substitutes for the true nectar, which is the ravishment of the intellect by coming nearer to the fact. These are auxiliaries to the centrifugal tendency of a man, to his passage out into free space, and they help him to escape the custody of that body in which he is pent up, and of that jail-yard of individual relations in which he is enclosed. Hence a great number of such as were professionally expressers of beauty, as painters, poets, musicians and actors, have been more than others wont to lead a life of pleasure and indulgence; all but the few who received the true nectar; and, as it was a spurious mode attaining freedom, as it was an emancipation not into the heavens but into the freedom of baser places, they were punished for that advantage they won, by a dissipation and deterioration. But never can any advantage be taken of nature by a trick. The spirit of the world, the great calm presence of the Creator, comes not forth to the sorceries of opium or of wine. The sublime vision comes to the pure and simple soul in a clean and chaste body. That is not an inspiration, which we owe to narcotics, but some counterfeit excitement and fury. Milton says that the lyric poet may drink wine and live generously, but the epic poet, he who shall sing of the gods and their descent unto men, must drink water out of a wooden bowl. For poetry is not "devil's wine," but God's wine. It is with this as it is with toys. We fill the hands and nurseries of our children with all manner of dolls, drums and horses; withdrawing their eyes from the plain face and sufficing objects of nature, the sun and moon, the animals, the water and stones, which should be their toys. So the poet's habit of living should be set on a key so low that the common influences should delight him. His cheerfulness should be the gift of the sunlight; the air should suffice for his inspiration, and he should be tipsy with water. That spirit which suffices quiet hearts, which seems to come forth to such from every dry knoll of sere grass, from every pine stump and half-imbedded stone on which the dull March sun shines, comes forth to the poor and hungry, and such as are of simple taste. If thou fill thy brain with Boston and New York, with fashion and covetousness, and wilt stimulate thy jaded senses with wine and French coffee, thou shalt find no radiance of wisdom in the lonely waste of the pine woods.

If the imagination intoxicates the poet, it is not inactive in other men. The metamorphosis excites in the beholder an emotion of joy. The use of symbols has a certain power of emancipation and exhilaration for all men. We seem to be touched by a wand which makes us dance and run about happily like children. We are like persons who come out of a cave or cellar into the open air. This is the effect on us of tropes, fables, oracles and all poetic forms. Poets are thus liberating gods. Men have really got a new sense, and found within their world another world, or nest of worlds; for, the metamorphosis once seen, we divine that it does not stop. I will not now consider how much this makes the charm of algebra and the mathematics, which also have their tropes, but it is felt in every definition; as when Aristotle defines *space* to be an immovable vessel in which things are contained; or when Plato defines a *line* to be a flowing point; or *figure* to be a bound of solid; and many the like. What a joyful sense of freedom we have when Vitruvius announces the old opinion of artists that no architect can build any house well who does not know something of anatomy.[16] When Socrates, in *Charmides,* tells us that the soul is cured of its maladies by certain incantations, and that these incantations are beautiful reasons, from which temperance is generated in souls; when Plato calls the world an animal, and Timaeus affirms that the plants also are animals; or affirms a man to be a heavenly tree, growing with his root, which is his head, upward; and, as George Chapman, following him, writes, "So in our tree of man, whose nervy root / Springs in his top";[17] when Orpheus speaks of hoariness as "that white flower which marks extreme old age"; when Proclus calls the universe the statue of the intellect; when Chaucer, in his praise of "gentilesse," compares good blood in mean condition to fire, which, though carried to the darkest house betwixt this and the mount of Caucasus, will yet hold its natural office and burn as bright as if twenty thousand men did it behold; when John saw, in the Apocalypse, the ruin of the world through evil, and the stars fall from heaven as the fig tree casteth her untimely fruit; when Aesop reports the whole catalogue of common daily relations through the masquerade of birds and beasts; we take the cheerful hint of the immortality of our essence and its versatile habit and escapes, as when the gypsies say of themselves "it is in vain to hang them, they cannot die."

---

[16] Marcus Vitruvius Pollio (first century), Roman writer on architecture.

[17] George Chapman (1559?–1634), Epistle Dedicatory to his translation of *Iliad,* 132–33.

The poets are thus liberating gods. The ancient British bards had for the title of their order, "Those who are free throughout the world." They are free, and they make free. An imaginative book renders us much more service at first, by stimulating us through its tropes, than afterward when we arrive at the precise sense of the author. I think nothing is of any value in books excepting the transcendental and extraordinary. If a man is inflamed and carried away by his thought, to that degree that he forgets the authors and the public and heeds only this one dream which holds him like an insanity, let me read his paper, and you may have all the arguments and histories and criticism. All the value which attaches to Pythagoras, Paracelsus, Cornelius Agrippa, Cardan, Kepler, Swedenborg, Schelling, Oken, or any other who introduces questionable facts into his cosmogony, as angels, devils, magic, astrology, palmistry, mesmerism, and so on, is the certificate we have of departure from routine, and that here is a new witness.[18] That also is the best success in conversation, the magic of liberty, which puts the world like a ball in our hands. How cheap even the liberty then seems; how mean to study, when an emotion communicates to the intellect the power to sap and upheave nature; how great the perspective! Nations, times, systems, enter and disappear like threads in tapestry of large figure and many colors; dream delivers us to dream, and while the drunkenness lasts we will sell our bed, our philosophy, our religion, in our opulence.

There is good reason why we should prize this liberation. The fate of the poor shepherd, who, blinded and lost in the snowstorm, perishes in a drift within a few feet of his cottage door, is an emblem of the state of man. On the brink of the waters of life and truth, we are miserably dying. The inaccessibleness of every thought but that we are in, is wonderful. What if you come near to it, you are as remote when you are nearest as when you are farthest. Every thought is also a prison; every heaven is also a prison. Therefore we love the poet, the inventor, who in any form, whether in an ode or in an action or in looks and behavior, has yielded us a new thought. He unlocks our chains and admits us to a new scene.

This emancipation is dear to all men, and the power to impart it, as it must come from greater depth and scope of thought, is a measure of intellect. Therefore all books of the imagination endure, all which ascend to that truth that the writer sees nature beneath him, and uses it as his exponent. Every verse or sentence possessing this virtue will take care of its own immortality. The religions of the world are the ejaculations of a few imaginative men.

But the quality of the imagination is to flow, and not to freeze. The poet did not stop at the color or the form, but read their meaning; neither may he rest in this meaning, but he makes the same objects exponents of his new thought. Here is the difference betwixt the poet and the mystic, that the last nails a symbol to one sense, which was a true sense for a moment, but soon becomes old and false. For all symbols are fluxional; all language is vehicular and transitive, and is good, as ferries and horses are, for conveyance, not as farms and houses are, for homestead. Mysticism consists is the mistake of an accidental and individual symbol for an universal one. The morning redness happens to be the favorite meteor to the eyes of Jacob Behmen,[19] and comes to stand to him for truth and faith; and, he believes, should stand for the same realities to every reader. But the first reader prefers as naturally the symbol of a mother and child, or a gardener and his bulb, or a jeweler polishing a gem. Either of these, or of a myriad more, are equally good to the person to whom they are significant. Only they must be held lightly, and be very willingly translated into the equivalent terms which others use. And the mystic must be steadily told, all that you say is just as true without the tedious use of that symbol as with it. Let us have a little algebra, instead of this trite rhetoric—universal signs, instead of these village symbols—and we shall both be gainers. The history of hierarchies seems to show that all religious error consisted in making the symbol too stark and solid, and was at last nothing but an excess of the organ of language.

Swedenborg, of all men in the recent ages, stands eminently for the translator of nature into thought. I do not know the man in history to whom things stood so uniformly for words. Before him the metamorphosis continually plays. Everything on which his eye rests, obeys the impulses of moral nature. The figs become grapes whilst he eats them. When some of his angels affirmed a truth, the laurel twig which they held blossomed in their hands. The noise which at a distance appeared like gnashing and thumping, on coming nearer was found to be the voice of disputants. The men in one of his visions, seen in heavenly light, appeared like dragons, and seemed in darkness; but to each other they appeared as men, and when the light from heaven shone into their cabin, they complained of the darkness, and were compelled to shut the window that they might see.

---

[18] Pythagoras (c. 582–c. 507 B.C.), Greek philosopher; Paracelsus (Theophrastus Bombastus von Hohenheim, 1493?–1541), Swiss physician and alchemist; Cornelius Agrippa (1486–1535), physician known for his occultist writings; Jerome Cardan (1501–1576?), French occultist; Johannes Kepler (1571–1630), German astronomer; Friedrich Wilhelm Joseph Schelling (1775–1854), German philosopher; Lorenz Oken (1779–1851), German philosopher.

[19] Usually spelled Jacob Boehme (1575–1624), German religious mystic.

There was this perception in him which makes the poet or seer an object of awe and terror, namely that the same man or society of men may wear one aspect to themselves and their companions, and a different aspect to higher intelligences. Certain priests, whom he describes as conversing very learnedly together, appeared to the children who were at some distance, like dead horses; and many the like misappearances. And instantly the mind inquires whether these fishes under the bridge, yonder oxen in the pasture, those dogs in the yard, are immutably fishes, oxen and dogs, or only so appear to me, and perchance to themselves appear upright men; and whether I appear as a man to all eyes. The Brahmins[20] and Pythagoras propounded the same question, and if any poet has witnessed the transformation he doubtless found it in harmony with various experiences. We have all seen changes as considerable in wheat and caterpillars. He is the poet and shall draw us with love and terror, who sees through the flowing vest the firm nature, and can declare it.

I look in vain for the poet whom I describe. We do not with sufficient plainness or sufficient profoundness address ourselves to life, nor dare we chant our own times and social circumstance. If we filled the day with bravery, we should not shrink from celebrating it. Time and nature yield us many gifts, but not yet the timely man, the new religion, the reconciler, whom all things await. Dante's praise is that he dared to write his autobiography in colossal cipher, or into universality. We have yet had no genius in America, with tyrannous eye, which knew the value of our incomparable materials, and saw, in the barbarism and materialism of the times, another carnival of the same gods whose picture he so much admires in Homer; then in the Middle Age; then in Calvinism. Banks and tariffs, the newspaper and caucus, Methodism and Unitarianism, are flat and dull to dull people, but rest on the same foundations of wonder as the town of Troy and the temple of Delphi, and are as swiftly passing away. Our log-rolling, our stumps and their politics, our fisheries, our Negroes and Indians, our boats and our repudiations, the wrath of rogues and the pusillanimity of honest men, the northern trade, the southern planting, the western clearing, Oregon and Texas, are yet unsung. Yet America is a poem in our eyes; its ample geography dazzles the imagination, and it will not wait long for meters. If I have not found that excellent combination of gifts in my countrymen which I seek, neither could I aid myself to fix the idea of the poet by reading now and then in Chalmers's collection of five centuries of English poets. These are wits more than poets, though there have been poets among them. But when we adhere to the ideal of the poet, we have our difficulties even with Milton and Homer. Milton is too literary, and Homer too literal and historical.

But I am not wise enough for a national criticism, and must use the old largeness a little longer, to discharge my errand from the Muse to the poet concerning his art.

Art is the path of the creator to his work. The paths or methods are ideal and eternal, though few men ever see them; not the artist himself for years, or for a lifetime, unless he come into the conditions. The painter, the sculptor, the composer, the epic rhapsodist, the orator, all partake one desire, namely to express themselves symmetrically and abundantly, not dwarfishly and fragmentarily. They found or put themselves in certain conditions, as, the painter and sculptor before some impressive human figures; the orator into the assembly of the people; and the others in such scenes as each has found exciting to his intellect; and each presently feels the new desire. He hears a voice, he sees a beckoning. Then he is apprised, with wonder, what herds of demons hem him in. He can no more rest; he says, with the old painter, "By God it is in me and must go forth of me." He pursues a beauty, half seen, which flies before him. The poet pours out verses in every solitude. Most of the things he says are conventional, no doubt; but by and by he says something which is original and beautiful. That charms him. He would say nothing else but such things. In our way of talking we say "That is yours, this is mine"; but the poet knows well that it is not his; that it is as strange and beautiful to him as to you; he would fain hear the like eloquence at length. Once having tasted this immortal ichor, he cannot have enough of it, and as an admirable creative power exists in these intellections, it is of the last importance that these things get spoken. What a little of all we know is said! What drops of all the sea of our science are baled up! And by what accident it is that these are exposed, when so many secrets sleep in nature! Hence the necessity of speech and song; hence these throbs and heart-beatings in the orator, at the door of the assembly, to the end namely that thought may be ejaculated as logos, or word.

Doubt not, O poet, but persist. Say "It is in me, and shall out." Stand there, balked and dumb, stuttering and stammering, hissed and hooted, stand and strive, until at last rage draw out of thee that dream power which every night shows thee is thine own; a power transcending all limit and privacy, and by virtue of which a man is the conductor of the whole river of electricity. Nothing walks, or creeps, or grows, or exists, which must not in turn arise and walk before him as exponent of his meaning. Comes he to that power, his genius is no longer exhaustible. All the creatures by pairs and by tribes pour into his mind as into a Noah's ark, to come forth again to people a new world. This is like the stock of air for our respiration or for the combustion of our fireplace; not a measure of gallons, but the entire atmosphere if wanted. And therefore the rich poets, as Homer, Chaucer, Shakespeare, and Raphael,[21] have obviously no limits to their works except the limits of their lifetime, and resemble a mirror carried through the street, ready to render an image of every created thing.

---

[20] Hindu priests.

O poet! A new nobility is conferred in groves and pastures, and not in castles or by the sword blade any longer. The conditions are hard, but equal. Thou shalt leave the world, and know the Muse only. Thou shalt not know any longer the times, customs, graces, politics, or opinions of men, but shalt take all from the Muse. For the time of towns is tolled from the world by funereal chimes, but in nature the universal hours are counted by succeeding tribes of animals and plants, and by growth of joy on joy. God wills also that thou abdicate a manifold and duplex life, and that thou be content that others speak for thee. Others shall be thy gentlemen and shall represent all courtesy and worldly life for thee; others shall do the great and resounding actions also. Thou shalt lie close hid with nature, and canst not be afforded to the Capitol or the Exchange. The world is full of renunciations and apprenticeships, and this is thine; thou must pass for a fool and a churl for a long season. This is the screen and sheath in which Pan has protected his well-beloved flower, and thou shalt be known only to thine own, and they shall console thee with tenderest love. And thou shalt not be able to rehearse the names of thy friends in thy verse, for an old shame before the holy ideal. And this is the reward; that the ideal shall be real to thee, and the impressions of the actual world shall fall like summer rain, copious, but not troublesome to thy invulnerable essence. Thou shalt have the whole land for thy park and manor, the sea for thy bath and navigation, without tax and without envy; the woods and the rivers thou shalt own, and thou shalt possess that wherein others are only tenants and boarders. Thou true landlord! Sealord! Airlord! Wherever snow falls or water flows or birds fly, wherever day and night meet in twilight, wherever the blue heaven is hung by clouds or sown with stars, wherever are forms with transparent boundaries, wherever are outlets into celestial space, wherever is danger, and awe, and love, there is beauty, plenteous as rain, shed for thee, and though thou shouldst walk the world over, thou shalt not be able to find a condition inopportune or ignoble.

---

[21] The inclusion of the Italian painter Raphael Santi (1483–1520) in a group of poets reflects the typically Romantic notion that poetry is something other than artifice, that it resides in the spirit of the poet.

Edgar Allan Poe

1809–1849

Poe's essay *The Poetic Principle* is interesting as an example of a certain kind of Romantic extremism as well as an example of renewed interest in the response of the reader. The remark that a long poem is a "flat contradiction in terms" goes far beyond Coleridge's earlier assertion (above, page 507) that a long poem need not be all poetry. In both cases poetry becomes a quality inherent in some writing, and perhaps inherent in nature or experience. It is not identical to a poem. Coleridge's use of "poetry" and "poem" is, however, more precise than Poe's, who leaves us confused about just what he means. We can conclude that for Poe, as for most Romantic sensibilities, the lyric was the model poem. Poe seems to have been prescient when he asserted that no long poem would again be popular.

Poe's judgment on the long poem is made purely in terms of what he conceives the reader's attention span to be. The value of a work depends wholly on the emotional effect, which is limited by the short staying power of the reader. He finds that Book II of Milton's *Paradise Lost* is no good if one has just waded through Book I, but is quite good if one omits Book I and begins with Book II. Hope of an objective judgment of taste, as discussed, for example, by Hume (above, page 323) and Kames (above, page 372), seems to be denied here. In another essay, *The Philosophy of Composition,* written three or four years before *The Poetic Principle,* Poe makes the same points and insists that the poet should begin his composition with a consideration of the effect of the work. He should limit the length of his poem, make it "universally appreciable," and convey a particular tone. Poe opts for sadness, which he considers the "most legitimate of all tones." In this he reveals an extreme form of Romantic taste.

In *The Poetic Principle* Poe also takes the Romantic distinction between poem and discursive statement to an extreme. He attacks the "didactic heresy," by which he means the tendency to think of a poem in terms of its message or discursive content. In this he foreshadows the notion of "heresy of paraphrase" offered by Cleanth Brooks (below, page 1036). For Poe, the poem exists only "for the poem's sake." But when Poe tries to discuss the value of poetry or a poem, he seems unequipped to go beyond remarks about "supernal beauty" and definitions of the poem as the "rhythmical creation of beauty." Still, he presents an example of certain Romantic legacies, and his theories were impressive enough to have influenced Charles Baudelaire, whose critical intelligence was more sophisticated.

Poe's complete works have been edited by J. A. Harrison (in seventeen volumes, 1902); his literary criticism has been edited by R. L. Hough (1965). See also C. H. Sisson, ed., *Poe's Poems and Essays on Poetry* (1995). from

The Poetic Principle

In speaking of the poetic principle, I have no design to be either thorough or profound. While discussing, very much at random, the essentiality of what we call poetry, my principal purpose will be to cite for consideration some few of those minor English or American poems which best suit my own taste, or which, upon my own fancy, have left the most definite impression. By "minor poems" I mean, of course, poems of little length. And here, in the beginning, permit me to say a few words in regard to a somewhat peculiar principle, which, whether rightfully or wrongfully, has always had its influence in my own critical estimate of the poem. I hold that a long poem does not exist. I maintain that the phrase, *a long poem,* is simply a flat contradiction in terms.

I need scarcely observe that a poem deserves its title only inasmuch as it excites, by elevating the soul. The value of the poem is in the ratio of this elevating excitement. But all excitements are, through a psychal necessity, transient. That degree of excitement which would entitle a poem to be so called at all cannot be sustained throughout a composition of any great length. After the lapse of half an hour, at the very utmost, it flags—fails—a revulsion ensues—and then the poem is, in effect, and in fact, no longer such.

There are, no doubt, many who have found difficulty in reconciling the critical dictum that the *Paradise Lost* is to be devoutly admired throughout, with the absolute impossibility of maintaining for it, during perusal, the amount of enthusiasm which that critical dictum would demand. This great work, in fact, is to be regarded as poetical, only when, losing sight of that vital requisite in all works of art, unity, we view it merely as a series of minor poems. If, to preserve its unity—its totality of effect or impression—we read it (as would be necessary) at a single sitting, the result is but a constant alternation of excitement and depression. After a passage of what we feel to be true poetry, there follows, inevitably, a passage of platitude which no critical prejudgment can force us to admire; but if, upon completing the work, we read it again omitting the first book—that is to say, commencing with the second—we shall be surprised at now finding that admirable which we before condemned—that damnable which we had previously so much admired. It follows from all this that the ultimate, aggregate, or absolute effect of even the best epic under the sun, is a nullity—and this is precisely the fact.

In regard to the *Iliad,* we have, if not positive proof, at least very good reason, for believing it intended as a series of lyrics; but, granting the epic intention, I can say only that the work is based in an imperfect sense of art. The modern epic is, of the supposititious ancient model, but an inconsiderate and blindfold imitation. But the day of these artistic anomalies is over. If, at any time, any very long poem were popular in reality, which I doubt, it is at least clear that no very long poem will ever be popular again.

That the extent of a poetical work is, *ceteris paribus,*[1] the measure of its merit, seems undoubtedly, when we thus state it, a proposition sufficiently absurd—yet we are indebted for it to the quarterly reviews. Surely there can be nothing in mere size, abstractly considered—there can be nothing in mere bulk, so far as a volume is concerned, which has so continuously elicited admiration from these saturnine pamphlets! A mountain, to be sure, by the mere sentiment of physical magnitude which it conveys, does impress us with a sense of the sublime—but no man is impressed after this fashion by the material grandeur of even *The Columbiad.*[2] Even the quarterlies have not instructed us to be so impressed by it. As yet, they have not insisted on our estimating Lamartine by the cubic foot, or Pollok[3] by the pound—but what else are we to infer from their continued prating about "sustained effort"? If, by "sustained effort," any little gentleman has accomplished an epic, let us frankly commend him for the effort—if this indeed be a thing commendable—but let us forbear praising the epic on the effort's account. It is to be hoped that common sense, in the time to come, will prefer deciding upon a work of art,

---

Poe's *The Poetic Principle* was delivered as a lecture several times in 1848 and 1849. It was published posthumously in 1850.

[1] "Other things equal."

[2] *The Columbiad* by Joel Barlow (1754–1812), American poet.

[3] Alphonse Marie Louis de Lamartine (1790–1869), French poet; Robert Pollok (1798–1827), Scottish poet.

rather by the impression it makes, by the effect it produces, than by the time it took to impress the effect or by the amount of "sustained effort" which had been found necessary in effecting the impression. The fact is, that perseverance is one thing, and genius quite another—nor can all the quarterlies in Christendom confound them. By and by, this proposition, with many which I have been just urging, will be received as self-evident. In the meantime, by being generally condemned as falsities, they will not be essentially damaged as truths.

On the other hand, it is clear that a poem may be improperly brief. Undue brevity degenerates into mere epigrammatism. A very short poem, while now and then producing a brilliant or vivid, never produces a profound or enduring effect. There must be the steady pressing down of the stamp upon the wax. Béranger[4] has wrought innumerable things, pungent and spirit-stirring; but, in general, they have been too imponderous to stamp themselves deeply into the public attention; and thus, as so many feathers of fancy, have been blown aloft only to be whistled down the wind.

A remarkable instance of the effect of undue brevity in depressing a poem—in keeping it out of the popular view—is afforded by the following exquisite little serenade:

I arise from dreams of thee
    In the first sweet sleep of night,
When the winds are breathing low,
    And the stars are shining bright;
I arise from dreams of thee,
    And a spirit in my feet
Hath led me—who knows how?
    To thy chamber-window, sweet!

The wandering airs, they faint
    On the dark, the silent stream;
The champak odors fail
    Like sweet thoughts in a dream;
The nightingale's complaint,
    It dies upon her heart,
As I must die on thine,
    Oh, beloved as thou art!

Oh, lift me from the grass!
    I die! I faint! I fail!
Let thy love in kisses rain
    On my lips and eyelids pale.
My cheek is cold and white, alas!
    My heart beats loud and fast:
Oh! Press it close to thine again,
    Where it will break at last![5]

Very few, perhaps, are familiar with these lines—yet no less a poet than Shelley is their author. Their warm, yet delicate and ethereal imagination will be appreciated by all—but by none so thoroughly as by him who has himself arisen from sweet dreams of one beloved to bathe in the aromatic air of a southern midsummer night.

One of the finest poems by Willis—the very best in my opinion, which he has ever written—has, no doubt, through this same defect of undue brevity, been kept back from its proper position, not less in the critical than in the popular view.

The shadows lay along Broadway,
    'Twas near the twilight tide,
And slowly there a lady fair
    Was walking in her pride.
Alone walked she; but, viewlessly,
    Walked spirits at her side.

Peace charmed the street beneath her feet
    And honor charmed the air;
And all astir looked kind on her,
    And called her good as fair,
For all God ever gave to her
    She kept with chary care.

She kept with care her beauties rare
    From lovers warm and true,
For her heart was cold to all but gold,
    And the rich came not to woo—
But honored well are charms to sell
    If priests the selling do.

Now walking there was one more fair—
    A slight girl, lily pale;
And she had unseen company
  To make the spirit quail:
'Twixt want and scorn she walked forlorn,
    And nothing could avail.

No mercy now can clear her brow
    For this world's peace to pray;

---

[4] Pierre Jean de Béranger (1780–1857), French songwriter.

[5] Percy Bysshe Shelley, *The Indian Serenade.* For a dissenting view see Robert Penn Warren's *Pure and Impure Poetry* (1943, reprinted in Warren's *Selected Essays,* 1958), which makes a negative judgment on the poem characteristic of the New Criticism.

For, as love's wild prayer dissolved in air,
Her woman's heart gave way!
But the sin forgiven by Christ in heaven
By man is cursed away![6]

In this composition we find it difficult to recognize the Willis who has written so many mere "verses of society." The lines are not only richly ideal, but full of energy; while they breathe an earnestness—an evident sincerity of sentiment—for which we look in vain throughout all the other works of this author.

While the epic mania—while the idea that, to merit in poetry, prolixity is indispensable—has, for some years past, been gradually dying out of the public mind, by mere dint of its own absurdity, we find it succeeded by a heresy too palpably false to be long tolerated, but one which, in the brief period it has already endured, may be said to have accomplished more in the corruption of our poetical literature than all its other enemies combined. I allude to the heresy of "the didactic." It has been assumed, tacitly and avowedly, directly and indirectly, that the ultimate object of all poetry is truth. Every poem, it is said, should inculcate a moral; and by this moral is the poetical merit of the work to be adjudged. We Americans, especially, have patronized this happy idea; and we Bostonians, very especially, have developed it in full. We have taken it into our heads that to write a poem simply for the poem's sake,[7] and to acknowledge such to have been our design, would be to confess ourselves radically wanting in the true poetic dignity and force: but the simple fact is, that, would we but permit ourselves to look into our own souls, we should immediately there discover that under the sun there neither exists not can exist any work more thoroughly dignified—more supremely noble than this very poem—this poem per se—this poem which is a poem and nothing more—this poem written solely for the poem's sake.

With as deep a reverence for the true as ever inspired the bosom of man, I would, nevertheless, limit, in some measure, its modes of inculcation. I would limit to enforce them. I would not enfeeble them by dissipation. The demands of truth are severe. She has no sympathy with the myrtles. All that which is so indispensable in song, is precisely all that with which she has nothing whatever to do. It is but making her a flaunting paradox, to wreathe her in gems and flowers. In enforcing a truth, we need severity rather than efflorescence of language. We must be simple, precise, terse. We must be cool, calm, unimpassioned. In a word, we must be in that mood which, as nearly as possible, is the exact converse of the poetical. He must be blind, indeed, who does not perceive the radical and chasmal differences between the truthful and the poetical modes of inculcation. He must be theory-mad beyond redemption who, in spite of these differences, shall still persist in attempting to reconcile the obstinate oils and waters of poetry and truth.

Dividing the world of mind into its three most obvious distinctions, we have the pure intellect, taste, and the moral sense. I place taste in the middle, because it is just this position which in the mind it occupies. It holds intimate relations with either extreme; but from the moral sense is separated by so faint a difference that Aristotle has not hesitated to place some of its operations among the virtues themselves.[8] Nevertheless, we find the offices of the trio marked with a sufficient distinction. Just as the intellect concerns itself with truth, so taste informs us of the beautiful, while the moral sense is regardful of duty. Of this latter, while conscience teaches the obligation, and reason the expediency, taste contents herself with displaying the charms: waging war upon vice solely on the ground of her deformity—her disproportion, her animosity to the fitting, to the appropriate, to the harmonious—in a word, to beauty.

An immortal instinct, deep within the spirit of man, is thus, plainly, a sense of the beautiful. This it is which administers to his delight in the manifold forms, and sounds, and odors, and sentiments amid which he exists. And just as the lily is repeated in the lake, or the eyes of Amaryllis in the mirror, so is the mere oral or written repetition of these forms, and sounds, and colors, and odors, and sentiments, a duplicate source of delight. But this mere repetition is not poetry. He who shall simply sing, with however glowing enthusiasm, or with however vivid a truth of description, of the sights, and sounds, and odors, and colors, and sentiments, which greet him in common with all mankind—he, I say, has yet failed to prove his divine title. There is still a something in the distance which he has been unable to attain. We have still a thirst unquenchable, to allay which he has not shown us the crystal springs. This thirst belongs to the immortality of man. It is at once a consequence and an indication of his perennial existence. It is the desire of the moth for the star. It is no mere appreciation of the beauty before us—but a wild effort to reach the beauty above. Inspired by an ecstatic prescience of the glories beyond the grave, we struggle, by multiform combinations among the things and thoughts of time, to attain a portion of that loveliness whose very elements, perhaps, appertain to eternity alone. And thus when by poetry—or when by music, the most entrancing of the poetic moods—we find ourselves melted into tears—not as the Abbaté Gravina[9] supposes—through excess of pleasure, but through a certain, petulant, impatient sorrow at our inability to grasp now, wholly, here on earth, at once and forever, those divine and rapturous joys, of which through the poem, or through the music, we attain to but brief and indeterminate glimpses.

[6] Nathaniel Parker Willis (1806–1867), American writer, *Unseen Spirits*.

[7] This phrase foreshadows a late-nineteenth-century phrase "art for art's sake" made famous by, among others, Oscar Wilde (below, page 711). See also the essay *Poetry for Poetry's Sake* by A. C. Bradley (delivered as a lecture in 1901) in his *Oxford Lectures on Poetry* (1910).

[8] Aristotle (above, page 48).

The struggle to apprehend the supernal loveliness—this struggle, on the part of souls fittingly constituted—has given to the world all that which it (the world) has ever been enabled at once to understand and to feel as poetic.

The poetic sentiment, of course, may develop itself in various modes—in painting, in sculpture, in architecture, in the dance—very especially in music—and very peculiarly, and with a wide field, in the composition of the landscape garden. Our present theme, however, has regard only to its manifestation in words. And here let me speak briefly on the topic of rhythm. Contenting myself with the certainty that music, in its various modes of meter, rhythm, and rhyme, is of so vast a moment in poetry as never to be wisely rejected—is so vitally important an adjunct, that he is simply silly who declines its assistance—I will not now pause to maintain its absolute essentiality. It is in music, perhaps, that the soul most nearly attains the great end for which, when inspired by the poetic sentiment, it struggles—the creation of supernal beauty. It may be, indeed, that here this sublime end is, now and then, attained in fact. We are often made to feel, with a shivering delight, that from an earthly harp are stricken notes which cannot have been unfamiliar to the angels. And thus there can be little doubt that in the union of poetry with music in its popular sense, we shall find the widest field for the poetic development. The old bards and minnesingers had advantages which we do not possess—and Thomas Moore,[10] singing his own songs, was, in the most legitimate manner, perfecting them as poems.

To recapitulate, then: I would define, in brief, the poetry of words as the rhythmical creation of beauty. Its sole arbiter is taste. With the intellect or with the conscience, it has only collateral relations. Unless incidentally, it has no concern whatever either with duty or with truth.

A few words, however, in explanation. That pleasure which is at once the most pure, the most elevating, and the most intense, is derived, I maintain, from the contemplation of the beautiful. In the contemplation of beauty we alone find it possible to attain that pleasurable elevation, or excitement, of the soul, which we recognize as the poetic sentiment, and which is so easily distinguished from truth, which is the satisfaction of the reason, or from passion, which is the excitement of the heart. I make beauty, therefore—using the word as inclusive of the sublime—I make beauty the province of the poem, simply because it is an obvious rule of art that effects should be made to spring as directly as possible from their causes—no one as yet having been weak enough to deny that the peculiar elevation in question is at least most readily attainable in the poem. It by no means follows, however, that the incitements of passion, or the precepts of duty, or even the lessons of truth, may not be introduced into a poem, and with advantage; for they may subserve, incidentally, in various ways, the general purposes of the work—but the true artist will always contrive to tone them down in proper subjection to that beauty which is the atmosphere and the real essence of the poem.

* * *

[Poe proceeds to present and comment briefly on a number of early-nineteenth-century lyric poems.]

Thus, although in a very cursory and imperfect manner, I have endeavored to convey to you my conception of the poetic principle. It has been my purpose to suggest that, while this principle itself is, strictly and simply, the human aspiration for supernal beauty, the manifestation of the principle is always found in an elevating excitement of the soul—quite independent of that passion which is the intoxication of the heart—or of that truth which is the satisfaction of the reason. For, in regard to passion, alas! Its tendency is to degrade, rather than to elevate the soul. Love, on the contrary—love, the true, the divine Eros—the Uranian, as distinguished from the Dionaean Venus[11]—is unquestionably the purest and truest of all poetical themes. And in regard to truth—if, to be sure, through the attainment of a truth, we are led to perceive a harmony where none was apparent before, we experience, at once, the true poetical effect—but this effect is referable to the harmony alone, and not in the least degree to the truth which merely served to render the harmony manifest.

We shall reach, however, more immediately a distinct conception of what the true poetry is, by mere reference to a few of the simple elements which induce in the poet himself the true poetical effect. He recognizes the ambrosia which nourishes his soul, in the bright orbs that shine in heaven—in the volutes of the flower—in the clustering of low shrubberies—in the waving of the grain fields—in the slanting of tall, eastern trees—in the blue distance of mountains—in the grouping of clouds—in the twinkling of half-hidden brooks—in the gleaming of silver rivers—in the repose of sequestered lakes—in the star-mirroring depths of lonely wells. He perceives it in the songs of birds—in the harp of Aeolus—in the sighing of the night wind—in the repining voice of the forest—in the surf that complaints to the shore—in the fresh breath of the woods—in the scent of the violet—in the voluptuous perfume of the hyacinth—in the suggestive odor that comes to him, at eventide, from far-distant, undiscovered islands, over dim oceans, illimitable and unexplored. He owns it in all noble thoughts—in all unworldly motives—in all holy impulses—in all chivalrous, generous, and self-sacrificing deeds. He feels it in the beauty of woman—in the grace of her step—in the luster of her eye—in the melody of her voice—in her soft laughter—in her sigh—in the harmony of the rustling of her robes. He deeply feels it in her winning endearments—in her burning enthusiasms—in her gentle charities—in her meek and devotional endurances—but above all—ah, far above all—he kneels to it—he worships it in the faith, in the purity, in the strength, in the altogether divine majesty—of her love.

Matthew Arnold

1822–1888

Arnold's *The Function of Criticism at the Present Time* (1864) is one of the most influential essays of his day. Here he treats literary criticism as an important branch of a general cultural criticism. In all branches of knowledge the aim of the critical power is the same: "to see the object as in itself it really is." This requires freeing oneself from polemics, refusing to "remain in a sphere where alone narrow and relative conceptions have any worth and validity." Arnold remarks that this is the difficult and indirect path, but it is the only possible one, for criticism must be "disinterested."

In advocating disinterested criticism, Arnold is censuring what he regards as the parochialism of English critics, their ignorance of European intellectual life, their special brand of "Philistinism." The disinterest that he preaches has some relationship to the idea of aesthetic disinterest in Kant's analysis of the reader's response to the work of art (above, page 420). However, Arnold's disinterest is principally an ethical principle based on the rational power rather than an aesthetic one. Arnold is by no means suggesting a withdrawal from effective social criticism but instead insisting on measured, intelligent, and often necessarily indirect critical activity.

Though he rejected a number of Victorian ideas or fashions, Arnold was quite influential in his own time. In an age marked by the emergence of historical criticism, he argues in *The Study of Poetry* against historical judgments on poems. He also rejects what he calls "personal judgments" on grounds similar to those later set forth by I. A. Richards (below, page 856). But when he comes to the question of what sort of critical judgment ought to be made he is in difficulty. He knows that poetry is not simply document or material for generating subjective emotion. But to discuss its value analytically, Arnold believes, is impossible; the value of a poem must simply be recognized. He is fond of terms like "poetic truth" and "high seriousness" (in his view Chaucer, for example, lacks the latter). His method in *The Study of Poetry* is not to attempt definition of such terms but instead to offer poetic examples of them—"touchstones." These touchstones can be as short as a single line. Like several of his Romantic predecessors, Arnold thinks, in this essay, not so much of the quality of a poem as a whole as he does of the presence of an undefinable poetic quality somewhere in a poem. There is no discursively expressible standard for these touchstones, and the catch-all evaluative term "high seriousness" is not explained. A liberally educated reader is apparently supposed to sense the presence of high seriousness. Sound critical judgments are made by educated people, not by those who make a mindless application of principle or method.

Following Arnold, one might at first think criticism doomed to become (1) purely descriptive or (2) purely expressive, pointing to, but not discussing, specimens of high seriousness. But this view misses Arnold's point that one must finally depend on the developed taste and erudition of the critic. In the 1864 essay, where Arnold speaks of "judging" as the critic's business, he points out that it must be "judgment which almost insensibly forms itself in a fair and clear mind, along with fresh knowledge." It is by "communicating fresh knowledge," not mere information, and not by laying down laws and judgments that the critic performs his most useful task. Arnold thus seeks to avoid both criticism that is really scholarship ancillary to the poem and subjective impressionism that is really poetic writing about poems—the approach advocated, for example, by the French critic and novelist Anatole France (1844–1924), who was consistent with himself when he wrote, 'To be quite frank, the critic ought to say 'Gentlemen, I am going to talk about myself on the subject of Shakespeare, or Racine, or Pascal, or Goethe—subjects that offer me a beautiful opportunity.' "

Arnold is an interesting figure in the history of the problem of value judgments. He is also important for his development of the argument that the power of true judgment is cultivated and the sensibility enlarged through a liberal education in which the reading of poetry plays an important role. Echoes of Arnold are frequent in later criticism—in the writings, for example, of I. A. Richards (below, page 856), T. S. Eliot (below, page 806), and Northrop Frye (below, page 1136).

The fifteen-volume edition of Arnold's works (1903–1904) was followed by his *Complete Prose Works,* edited by R. H. Super (1960 ff.). See Lionel Trilling *Matthew Arnold* (1939); E. K. Brown, *Arnold: A Study in Conflict* (1948); David Perkins, "Arnold and the Function of Literature," *English Literary History* XVIII (1951), 287–309; J. S. The Function of Criticism at the Present Time

Many objections have been made to a proposition which, in some remarks of mine on translating Homer, I ventured to put forth; a proposition about criticism and its importance at the present day. I said: "Of the literature of France and Germany, as of the intellect of Europe in general, the main effort, for now many years, has been a critical effort; the endeavor, in all branches of knowledge, theology, philosophy, history, art, science, to see the object as in itself it really is." I added, that owing to the operation in English literature of certain causes, "almost the last thing for which one would come to English literature is just that very thing which now Europe most desires—criticism"; and that the power and value of English literature was thereby impaired. More than one rejoinder declared that the importance I here assigned to criticism was excessive, and asserted the inherent superiority of the creative effort of the human spirit over its critical effort. And the other day, having been led by a

---

Arnold's *The Function of Criticism at the Present Time* was first published in 1864.

Mr. Shairp's excellent notice of Wordsworth[1] to turn again to his biography, I found, in the words of this great man, whom I, for one, must always listen to with the profoundest respect, a sentence passed on the critic's business, which seems to justify every possible disparagement of it. Wordsworth says in one of his letters: "The writers in these publications [the reviews], while they prosecute their inglorious employment, cannot be supposed to be in a state of mind very favorable for being effected by the finer influences of a thing so pure as genuine poetry."[2] And a trustworthy reporter of his conversation quotes a more elaborate judgment to the some effect:

> Wordsworth holds the critical power very low, infinitely lower than the inventive; and he said today that if the quantity of time consumed in writing critiques on the works of others were given to original composition, of whatever kind it might be, it would be much better employed; it would make a man find out sooner his own level, and it would do infinitely less mischief. A false or malicious criticism may be much injury to the minds of others, a stupid invention, either in prose or verse, is quite harmless.[3]

It is almost too much to expect of poor human nature, that a man capable of producing some effect in one line of literature, should, for the greater good of society, voluntarily doom himself to impotence and obscurity in another. Still less is this to be expected from men addicted to the composition of the "false or malicious criticism" of which Wordsworth speaks. However, everybody would admit that a false or malicious criticism had better never have been written. Everybody, too, would be willing to admit, as a general proposition, that the critical faculty is lower than the inventive. But is it true that criticism is really, in itself, a baneful and injurious employment; is it true that all time given to writing critiques on the works of others would be much better employed if it were given to original composition, of whatever kind this may be? Is it true that Johnson had better have gone on producing more *Irenes* instead of writing his *Lives of the Poets;*[4] nay, is it certain that Wordsworth himself was better employed in making his *Ecclesiastical Sonnets* than when he made his celebrated Preface, so full of criticism, and criticism of the works of others? Wordsworth was himself a great critic, and it is to be sincerely regretted that he has not left us more criticism; Goethe was one of the greatest of critics, and we may sincerely congratulate ourselves that he has left us so much criticism. Without wasting time over the exaggeration which Wordsworth's judgment on criticism clearly contains, or over an attempt to trace the causes—not difficult, I think, to be traced—which may have led Wordsworth to this exaggeration, a critic may with advantage seize an occasion for trying his own conscience, and for asking himself of what real service at any given moment the practice of criticism either is or may be made to his own mind and spirit, and to the minds and spirits of others.

The critical power is of lower rank than the creative. True; but in assenting to this proposition, one or two things are to be kept in mind. It is undeniable that the exercise of a creative power, that a free creative activity, is the highest function of man; it is proved to be so by man's finding in it his true happiness. But it is undeniable, also, that men may have the sense of exercising this free creative activity in other ways than in producing great works of literature or art; if it were not so, all but a very few men would be shut out from the true happiness of all men. They may have it in well-doing, they may have it in learning, they may have it even in criticizing. This is one thing to be kept in mind. Another is, that the exercise of the creative power in the production of great works of literature or art, however high this exercise of it may rank, is not at all epochs and under all conditions possible; and that therefore labor may be vainly spent in attempting it, which might with more fruit be used in preparing for it, in rendering it possible. This creative power works with elements, with materials; what if it has not those materials, those elements, ready for its use? In that case it must surely wait till they are ready. Now, in literature—I will limit myself to literature, for it is about literature that the question arises—the elements with which the creative power works are ideas; the best ideas on every matter which literature touches, current at the time. At any rate we may lay it down as certain that in modern literature no manifestation of the creative power not working with these can be very important or fruitful. And I say *current* at the time, not merely accessible at the time; for creative literary genius does not principally show itself in discovering new ideas, that is rather the business of the philosopher. The grand work of literary genius is a work of synthesis and exposition, not of analysis and discovery; its gift lies in the faculty of being happily inspired by a certain intellectual and spiritual atmosphere, by a certain order of ideas, when it finds itself in them; of dealing divinely with these ideas, presenting them in the most effective and attractive combinations,—making beautiful works with them, in short. But it must have the atmosphere, it must find itself amidst the order of ideas, in order to work freely; and these it is not so easy to command. This is why great creative epochs in literature are so rare, this is why there is so much that is unsatisfactory in the productions of many men of real genius; because, for the creation of a masterwork of literature two powers must concur, the power of the man and the power of the moment, and the man is not enough without the moment; the creative power has, for its happy exercise, appointed elements, and those elements are not in its own control.

---

[1] J. C. Shairp, Scots critic, wrote "Wordsworth: The Man and Poet," *North British Review* XLI (1864). [Arnold] I cannot help thinking that a practice, common in England during the last century, and still followed in France, of printing a notice of this kind—a notice by a competent critic—to serve as an introduction to an eminent author's work, might be revived among us with advantage. To introduce all succeeding editions of Wordsworth, Mr. Shairp's notice might, it seems to me, excellently serve; it is written from the point of view of an admirer, nay, of a disciple, and that is right; but then the disciple must be also, as in this case he is, a critic, a man of letters, not, as too often happens, some relation or friend with no qualification for his task except affection for his author.

[2] Letter to Bernard Barton (1816) in Christopher Wordsworth, *Memoirs of William Wordsworth* II (1851), 51.

[3] W. Knight, *Life of Wordsworth* III, 438 (1889 edition).

[4] 1781.

Nay, they are more within the control of the critical power. It is the business of the critical power, as I said in the words already quoted, "in all branches of knowledge, theology, philosophy, history, art, science, to see the object as in itself it really is." Thus it tends, at last, to make an intellectual situation of which the creative power can profitably avail itself. It tends to establish an order of ideas, if not absolutely true, yet true by comparison with that which it displaces; to make the best ideas prevail. Presently these new ideas reach society, the touch of truth is the touch of life, and there is a stir and growth everywhere; out of this stir and growth come the creative epochs of literature.

Or, to narrow our range, and quit these considerations of the general march of genius and of society—considerations which are apt to become too abstract and impalpable—everyone can see that a poet, for instance, ought to know life and the world before dealing with them in poetry; and life and the world being in modern times very complex things, the creation of a modern poet, to be worth much, implies a great critical effort behind it; else it must be a comparatively poor, barren, and short-lived affair. This is why Byron's poetry had so little endurance in it, and Goethe's so much, both Byron and Goethe had a great productive power, but Goethe's was nourished by a great critical effort providing the true materials for it, and Byron's was not; Goethe knew life and the world, the poet's necesssary subjects, much more comprehensively and thoroughly than Byron. He knew a great deal more of them, and he knew them much more as they really are.

It has long seemed to me that the burst of creative activity in our literature, through the first quarter of this century, had about it in fact something premature; and that from this cause its productions are doomed, most of them, in spite of the sanguine hopes which accompanied and do still accompany them to prove hardly more lasting than the productions of far less splendid epochs. And this prematureness comes from its having proceeded without having its proper data, without sufficient materials to work with. In other words, the English poetry of the first quarter of this century, with plenty of energy, plenty of creative force, did not know enough. This makes Byron so empty of matter, Shelley[5] so incoherent, Wordsworth even, profound as he is, yet so wanting in completeness and variety. Wordsworth cared little for books, and disparaged Goethe. I admire Wordsworth, as he is, so much that I cannot wish him different; and it is vain, no doubt, to imagine such a man different from what he is, to suppose that he *could* have been different. But surely the one thing wanting to make Wordsworth an even greater poet than he is—his thought richer, and his influence of wider application—was that he should have read more books, among them, no doubt, those of that Goethe whom he disparaged without reading him.

But to speak of books and reading may easily lead to a misunderstanding here. It was not really books and reading that lacked to our poetry at this epoch; Shelley had plenty of reading, Coleridge[6] had immense reading. Pindar[7] and Sophocles—as we all say so glibly, and often with so little discernment of the real import of what we are saying—had not many books; Shakespeare was no deep reader. True; but in the Greece of Pindar and Sophocles, in the England of Shakespeare, the poet lived in a current of ideas in the highest degree animating and nourishing to the creative power; society was, in the fullest measure, permeated by fresh thought, intelligent and alive. And this state of things is the true basis for the creative power's exercise, in this it finds its data, its materials, truly ready for its hand; all the books and reading in the world are only valuable as they are helps to this. Even when this does not actually exist, books and reading may enable a man to construct a kind of semblance of it in his own mind, a world of knowledge and intelligence in which he may live and work. This is by no means an equivalent to the artist for the nationally diffused life and thought of the epochs of Sophocles or Shakespeare; but besides that it may be a means of preparation for such epochs, it does really constitute, if many share in it, a quickening and sustaining atmosphere of great value. Such an atmosphere the many-sided learning and the long and widely combined critical effort of Germany formed for Goethe, when he lived and worked. There was no national glow of life and thought there as in the Athens of Pericles or the England of Elizabeth.[8] That was the poet's weakness. But there was a sort of equivalent for it in the complete culture and unfettered thinking of a large body of Germans. That was his strength. In the England of the first quarter of this century there was neither a national glow of life and thought, such as we had in the age of Elizabeth, nor yet a culture and a force of learning and criticism such as were to be found in Germany. Therefore the creative power of poetry wanted, for success in the highest sense, materials and a basis; a thorough interpretation of the world was necessarily denied to it.

[6] Coleridge (above, page 493).

[7] Pindar (518?–c.448 B.C.), Greek lyric poet.

At first sight it seems strange that out of the immense stir of the French Revolution and its age should not have come a crop of works of genius equal to that which came out of the stir of the great productive time of Greece, or out of that of the Renaissance, with its powerful episode the Reformation. But the truth is that the stir of the French Revolution took a character which essentially distinguished it from such movements as these. These were, in the main, disinterestedly intellectual and spiritual movements; movements in which the human spirit looked for its satisfaction in itself and in the increased play of its own activity. The French Revolution took a political, practical character. The movement, which went on in France under the old regime from 1700 to 1789, was far more really akin than that of the Revolution itself to the movement of the Renaissance; the France of Voltaire and Rousseau[9] told far more powerfully upon the mind of Europe than the France of the Revolution. Goethe reproached this last expressly with having "thrown quiet culture back." Nay, and the true key to how much in our Byron, even in our Wordsworth, is this!—that they had their source in a great movement of feeling, not in a great movement of mind. The French Revolution, however—that object of so much blind love and so much blind hatred—found undoubtedly its motive power in the intelligence of men, and not in their practical sense; this is what distinguishes it from the English Revolution of Charles the First's time.[10] This is what makes it a more spiritual event than our Revolution, an event of much more powerful and worldwide interest, though practically less successful; it appeals to an order of ideas which are universal, certain, permanent. 1789 asked of a thing, is it rational? 1642 asked of a thing, is it legal? Or, when it went furthest, is it according to conscience? This is the English fashion, a fashion to be treated, within its own sphere, with the highest respect; for its success, within its own sphere, has been prodigious. But what is law in one place is not law in another; what is law here today is not law even here tomorrow; and as for conscience, what is binding on one man's conscience is not binding on another's: The old woman who threw her stool at the head of the surpliced minister in St. Giles' Church at Edinburgh[11] obeyed an impulse to which millions of the human race may be permitted to remain strangers. But the prescriptions of reason are absolute, unchanging, of universal validity; "to count by tens is the easiest way of counting"—that is a proposition of which everyone, from here to the Antipodes, feels the force; at least I should say so if we did not live in a country where it is not impossible that any morning we may find a letter in the *Times* declaring that a decimal coinage is an absurdity. That a whole nation should have been penetrated with an enthusiasm for pure reason, and with an ardent zeal for making its prescriptions triumph, is a very remarkable thing, when we consider how little of mind, or anything so worthy and quickening as mind, comes into the motives which alone, in general, impel great masses of men. In spite of the extravagant direction given to this enthusiasm, in spite of the crimes and follies in which it lost itself, the French Revolution derives from the force, truth, and universality of the ideas which it took for its law, and from the passion with which it could inspire a multitude for these ideas, a unique and still living power; it is—it will probably long remain—the greatest, the most animating event in history. And as no sincere passion for the things of the mind, even though it turn out in many respects an unfortunate passion, is ever quite thrown away and quite barren of good. France has reaped from hers one fruit—the natural and legitimate fruit though not precisely the grand fruit she expected: she is the country in Europe where *the people* is most alive.

But the mania for giving an immediate political and practical application to all these fine ideas of the reason was fatal. Here an Englishman is in his element: on this theme we can all go on for hours. And all we are in the habit of saying on it has undoubtedly a great deal of truth. Ideas cannot be too much prized in and for themselves, cannot be too much lived with; but to transport them abruptly into the world of politics, and practice, violently to revolutionize this world to their bidding—that is quite another thing. There is the world of ideas and there is the world of practice; the French are often for suppressing the one and the English the other; but neither is to be suppressed. A member of the House of Commons said to me the other day: "That a thing is an anomaly, I consider to be no objection to it whatever." I venture to think he was wrong; that a thing is an anomaly *is* an objection to it, but absolutely and in the sphere of ideas: it is not necessarily, under such-and-such circumstances, or at such-and-such a moment, an objection to it in the sphere of politics and practice. Joubert has said beautifully: *"C'est la force et le droit qui règlent toutes choses dans le monde; la force en attendant le droit."* (Force and right are the governors of this world; force till right is ready.)[12] "Force till right is ready"; and till right is ready, force, the existing order of things, is justified, is the legitimate ruler. But right is something moral, and implies inward recognition, free assent of the will; we are not ready for right—"right," so far as we are concerned, "is not ready,"—until we have attained this sense of seeing it and willing it. The way in which for us it may change and transform force, the existing order of things, and become, in its turn, the legitimate ruler of the world, should depend on the way in which, when our time comes, we see it and will it. Therefore for other people enamored of their own newly discerned right, to attempt to impose it upon us as ours, and violently to substitute their right for our force, is an act of tyranny, and to be resisted. It sets at naught the second great half of our maxim, "force till right is ready." This was the grand error of the French Revolution; and its movement of ideas, by quitting the intellectual sphere and rushing furiously into the political sphere, ran, indeed, a prodigious and memorable course, but produced no such intellectual fruit as the movement of ideas of the Renaissance, and created, in opposition to itself, what I may call an epoch of concentration. The great force of that epoch of concentration was England; and the great voice of that epoch of concentration was Burke. It is the fashion to treat Burke's writings on the French Revolution[13] as superannuated and conquered by the event; as the eloquent but unphilosophical tirades of bigotry and prejudice. I will not deny that they are often disfigured by the violence and passion of the moment, and that in some directions Burke's view was bounded, and his observation therefore at fault. But on the whole, and for those who can make the needful corrections, what distinguishes these writings is their profound, permanent, fruitful, philosophical truth. They contain the true philosophy of an epoch of concentration, dissipate the heavy atmosphere which its own nature is apt to engender round it, and make its resistance rational instead of mechanical.

---

[8] Pericles (c. 495–429 B.C.), Athenian statesman; Queen Elizabeth I reigned from 1558 to 1603.

[9] Francois Marie Arouet de Voltaire (1694–1778), Jean Jacques Rousseau (1712–1778), French philosophers.

[10] Charles I reigned from 1625 to 1649.

[11] In 1637 there was an effort at St. Giles's to read the new service prescribed by Charles I for Scotland.

But Burke is so great because, almost alone in England, he brings thought to bear upon politics, he saturates politics with thought. It is his accident that his ideas were at the service of an epoch of concentration, not of an epoch of expansion; it is his characteristic that he so lived by ideas, and had such a source of them welling up within him, that he could float even an epoch of concentration and English Tory politics with them. It does not hurt him that Dr. Price and the Liberals were enraged with him; it does not even hurt him that George the Third and the Tories were enchanted with him.[14] His greatness is that he lived in a world which neither English Liberalism nor English Toryism is apt to enter;—the world of ideas, not the world of catchwords and party habits. So far is it from being really true of him that he "to party gave up what was meant for mankind," that at the very end of his fierce struggle with the French Revolution after all his invectives against its false pretensions, hollowness, and madness, with his sincere conviction of its mischievousness, he can close a memorandum on the best means of combating it, some of the last pages he ever wrote—the *Thoughts on French Affairs,* in December 1791—with these striking words:

> The evil is stated, in my opinion, as it exists. The remedy must be where power, wisdom, and information, I hope, are more united with good intentions than they can be with me. I have done with this subject, I believe, forever. It has given me many anxious moments for the last two years. *If a great change is to be made in human affairs, the minds of men will be fitted to it; the general opinions and feelings will draw that way. Every fear, every hope will forward it; and then they who persist in opposing this mighty current in human affairs, will appear rather to resist the decrees of Providence itself, than the mere designs of men. They will not be resolute and firm, but perverse and obstinate.*

That return of Burke upon himself has always seemed to me one of the finest things in English literature, or indeed in any literature. That is what I call living by ideas: when one side of a question has long had your earnest support, when all your feelings are engaged, when you hear all around you no language but one, when your party talks this language like a steam engine and can imagine no other—still to be able to think, still to be irresistibly carried, if so it be, by the current of thought to the opposite side of the question, and, like Balaam,[15] to be unable to speak anything but what the Lord has put in your mouth. I know nothing more striking, and I must add that I know nothing more un-English.

---

[12] Joseph Joubert (1754–1824), *Pensees* I, 178 (1869 edition).

[13] Edmund Burke (above, page 332).

[14] Richard Price (1723–1791), English dissenting clergyman; George III reigned from 1760 to 1820.

For the Englishman in general is like my friend the Member of Parliament, and believes, pointblank, that for a thing to be an anomaly is absolutely no objection to it whatever. He is like the Lord Auckland of Burke's day, who, in a memorandum on the French Revolution, talks of "certain miscreants, assuming the name of philosophers, who have presumed themselves capable of establishing a new system of society."[16] The Englishman has been called a political animal, and he values what is political and practical so much that ideas easily becomes objects of dislike in his eyes, and thinkers "miscreants," because ideas and thinkers have rashly meddled with politics and practice. This would be all very well if the dislike and neglect confined themselves to ideas transported out of their own sphere, and meddling rashly with practice; but they are inevitably extended to ideas as such, and to the whole life of intelligence; practice is everything, a free play of the mind is nothing. The notion of the free play of the mind upon all subjects being a pleasure in itself, being an object of desire, being an essential provider of elements without which a nation's spirit, whatever compensations it may have for them, must, in the long run, die of inanition, hardly enters into an Englishman's thoughts. It is noticeable that the word *curiosity,* which in other languages is used in a good sense, to mean, as a high and fine quality of man's nature, just this disinterested love of a free play of the mind on all subjects, for its own sake—it is noticeable, I say, that this word has in our language no sense of the kind, no sense but a rather bad and disparaging one. But criticism, real criticism is essentially the exercise of this very quality. It obeys an instinct prompting it to try to know the best that is known and thought in the world, irrespectively of practice, politics, and everything of the kind; and to value knowledge and thought as they approach this best, without the intrusion of any other considerations whatever. This is an instinct for which there is, I think, little original sympathy in the practical English nature, and what there was of it has undergone a long benumbing period of blight and suppression in the epoch of concentration which followed the French Revolution.

But epochs of concentration cannot well endure forever; epochs of expansion, in the due course of things, follow them. Such an epoch of expansion seems to be opening in this country. In the first place all danger of a hostile forcible pressure of foreign ideas upon our practice has long disappeared; like the traveler in the fable, therefore, we begin to wear our cloak a little more loosely. Then, with a long peace the ideas of Europe steal gradually and amicably in, and mingle, though in infinitesimally small quantities at a time, with our own notions. Then, too, in spite of all that is said about the absorbing and brutalizing influence of our passionate material progress, it seems to me indisputable that this progress is likely, though not certain, to lead in the end to an apparition of intellectual life; and that man, after he has made himself perfectly comfortable and has now to determine what to do with himself next, may begin to remember that he has a mind, and that the mind may be made the source of great pleasure. I grant it is mainly the privilege of faith, at present, to discern this end to our railways, our business, and our fortune-making; but we shall see if, here as elsewhere, faith is not in the end the true prophet. Our ease, our traveling, and our unbounded liberty to hold just as hard and securely as we please to the practice to which our notions have given birth, all tend to beget an inclination to deal a little more freely with these notions themselves, to canvass them a little, to penetrate a little into their real nature. Flutterings of curiosity, in the foreign sense of the word, appear amongst us, and it is in these that criticism must look to find its account. Criticism first; a time of true creative activity, perhaps—which, as I have said, must inevitably be preceded amongst us by a time of criticism—hereafter, when criticism has done its work.

It is of the last importance that English criticism should clearly discern what rule for its course, in order to avail itself of the field now opening to it, and to produce fruit for the future, it ought to take. The rule may be summed up in one word—*disinterestedness.*[17] And how is criticism to show disinterestedness? By keeping aloof from what is called "the practical view of things"; by resolutely following the law of its own nature, which is to be a free play of the mind on all subjects which it touches. By steadily refusing to lend itself to any of those ulterior, political, practical considerations about ideas, which plenty of people will be sure to attach to them, which perhaps ought often to be attached to them, which in this country at any rate are certain to be attached to them quite sufficiently, but which criticism has really nothing to do with. Its business is, as I have said, simply to know the best that is known and thought in the world, and by in its turn making this known, to create a current of true and fresh ideas. Its business is to do this with inflexible honesty, with due ability; but its business is to do no more, and to leave alone all questions of practical consequences and applications, questions which will never fail to have due prominence given to them. Else criticism, besides being really false to its own nature, merely continues in the old rut which it has hitherto followed in this country, and will certainly miss the chance now given to it. For what is at present the bane of criticism in this country? It is that practical considerations cling to it and stifle it. It subserves interests not its own. Our organs of criticism are organs of men and parties having practical ends to serve, and with them those practical ends are the first thing and the play of mind the second; so much play of mind as is compatible with the prosecution of those practical ends is all that is wanted. An organ like the *Revue des Deux Mondes,* having for its main function to understand and utter the best that is known and thought in the world, existing, it may be said, as just an organ for a free play of the mind, we have not. But we have the *Edinburgh Review,* existing as an organ of the old Whigs, and for as much play of the mind as may suit its being that; we have the *Quarterly Review,* existing as an organ of the Tories, and for as much play of mind as may suit its being that; we have the *British Quarterly Review,* existing as an organ of the political Dissenters, and for as much play of mind as may suit its being that; we have the *Times,* existing as an organ of the common, satisfied, well-to-do Englishman, and for as much play of mind as may suit its being that. And so on through all the various factions, political and religious, of our society; every faction has, as such, its organs of criticism, but the notion of combining all factions in the common pleasure of a free disinterested play of mind meets with no favor. Directly this play of mind wants to have more scope, and to forget the pressure of practical considerations a little, it is checked, it is made to feel the chain. We saw this the other day in the extinction, so much to be regretted, of the *Home and Foreign Review.* Perhaps in no organ of criticism in this country was there so much knowledge, so much play of mind; but these could not save it. The *Dublin Review* subordinates play of mind to the practical business of English and Irish Catholicism, and lives. It must needs be that men should act in sects and parties, that each of these sects and parties should have its organ, and should make this organ subserve the interests of its action; but it would be well, too, that there should be a criticism, not the minister of these interests, not their enemy but absolutely and entirely independent of them. No other criticism will ever attain any real authority or make any real ways towards its end—the creating a current of true and fresh ideas.

---

[15] Numbers 22–24.

[16] Lord Auckland (William Eden, 1744–1814).

[17] Compare Kant (above, page 420).

It is because criticism has so little kept in the pure intellectual sphere, has so little detached itself from practice, has been so directly polemical and controversial, that it has so ill accomplished, in this country, its best spiritual work; which is to keep man from a self-satisfaction which is retarding and vulgarizing, to lead him towards perfection, by making his mind dwell upon what is excellent in itself, and the absolute beauty and fitness of things. A polemical practical criticism makes men blind even to the ideal imperfection of their practice, makes them willingly assert its ideal perfection, in order the better to secure it against attack: and clearly this is narrowing and baneful for them. If they were reassured on the practical side, speculative considerations of ideal perfection they might be brought to entertain, and their spiritual horizon would thus gradually widen. Sir Charles Adderley[18] says to the Warwickshire farmers:

> Talk of the improvement of breed! Why, the race we ourselves represent, the men and women, the old Anglo-Saxon race, are the best breed in the whole world. . . . The absence of a too enervating climate, too unclouded skies, and a too luxurious nature, has produced so vigorous a race of people and has rendered us so superior to all the world.

Mr. Roebuck[19] says to the Sheffield cutlers:

> I look around me and ask what is the state of England? Is not property safe? Is not every man able to say what he likes? Can you not walk from one end of England to the other in perfect security? I ask you whether, the world over or in past history, there is anything like it? Nothing. I pray that our unrivaled happiness may last.

Now obviously there is a peril for poor human nature in words and thoughts of such exuberant self-satisfaction, until we find ourselves safe in the streets of the celestial city. *"Das wenige verschwindet leicht dem Blicke / Der vorwärts sieht, wie viel noch übrig bleibt"* says Goethe; "the little that is done seems nothing when we look forward and see how much we have yet to do."[20] Clearly this is a better line of reflection for weak humanity, so long as it remains on this earthly field of labor and trial.

---

[18] Sir Charles Adderley, Conservative statesman, active 1858–1868.

[19] Liberal Member of Parliament for Sheffield.

[20] *Iphigenia in Tauris* i, ii, 91–92.

But neither Sir Charles Adderley nor Mr. Roebuck is by nature inaccessible to considerations of this sort. They only lose sight of them owing to the controversial life we all lead, and the practical form which all speculation takes with us. They have in view opponents whose aim is not ideal, but practical; and in their zeal to uphold their own practice against these innovators, they go so far as even to attribute to this practice an ideal perfection. Somebody has been wanting to introduce a six-pound franchise, or to abolish church rates, or to collect agricultural statistics by force, or to diminish local self-government. How natural, in reply to such proposals, very likely improper or ill timed, to go a little beyond the mark and to say stoutly, "Such a race of people as we stand, so superior to all the world! The old Anglo-Saxon race, the best breed in the whole world! I pray that our unrivaled happiness may last! I ask you whether, the world over or in past history, there is anything like it?" And so long as criticism answers this dithyramb by insisting that the old Anglo-Saxon race would be still more superior to all others if it had no church rates, or that our unrivaled happiness would last yet longer with a six-pound franchise, so long will the strain, "the best breed in the whole world!" swell louder and louder, everything ideal and refining will be lost out of sight, and both the assailed and their critics will remain in a sphere, to say the truth, perfectly unvital, a sphere in which spiritual progression is impossible. But let criticism leave church rates and the franchise alone, and in the most candid spirit, without a single lurking thought of practical innovation, confront with our dithyramb this paragraph on which I stumbled in a newspaper immediately after reading Mr. Roebuck: "A shocking child murder has just been committed at Nottingham. A girl named Wragg left the workhouse there on Saturday morning with her young illegitimate child. The child was soon afterwards found dead on Mapperly Hills, having been strangled. Wragg is in custody."

Nothing but that; but, in juxtaposition with the absolute eulogies of Sir Charles Adderley and Mr. Roebuck, how eloquent, how suggestive are those few lines! "Our old Anglo-Saxon breed, the best in the whole world!" How much that is harsh and ill favored there is in this best! *Wragg!* If we are to talk of ideal perfection of "the best in the whole world," has any one reflected what a touch of grossness in our race, what an original shortcoming in the more delicate spiritual perceptions, is shown by the natural growth amongst us of such hideous names—Higginbottom, Stiggins, Bugg! In Ionia and Attica they were luckier in this respect than "the best race in the world"; by the Ilissus there was no Wragg, poor thing! And "our unrivaled happiness"—what an element of grimness, bareness, and hideousness mixes with it and blurs it; the workhouse, the dismal Mapperly Hills—how dismal those who have seen them will remember—the gloom, the smoke, the cold, the strangled illegitimate child! "I ask you whether, the world over or in past history, there is anything like it?" Perhaps not, one is inclined to answer; but at any rate, in that case, the world is very much to be pitied. And the final touch—short, bleak and inhuman: "Wragg is in custody." The sex lost in the confusion of our unrivaled happiness; or (shall I say?) the superfluous Christian name lopped off by the straightforward vigor of our old Anglo-Saxon breed! There is profit for the spirit in such contrasts as this; criticism serves the cause of perfection by establishing them. By eluding sterile conflict, by refusing to remain in the sphere where alone narrow and relative conceptions have any worth and validity, criticism may diminish its momentary importance, but only in this way has it a chance of gaining admittance for those wider and and more perfect conceptions to which all its duty is really owed. Mr. Roebuck will have a poor opinion of an adversary who replies to his defiant songs of triumph only by murmuring under his breath, "Wragg is in custody"; but in no other way will these songs of triumph be induced gradually to moderate themselves, to get rid of what in them is excessive and offensive, and to fall into a softer and truer key.

It will be said that it is a very subtle and indirect action which I am thus prescribing for criticism, and that, by embracing in this manner the Indian virtue of detachment and abandoning the sphere of practical life, it condemns itself to a slow and obscure work. Slow and obscure it may be, but it is the only proper work of criticis. The mass of mankind will never have any ardent zeal for seeing things as they are; very inadequate ideas will always satisfy them. On these inadequate ideas reposes, and must repose, the general practice of the world. That is as much as saying that whoever sets himself to see things as they are will find himself one of a very small circle; but it is only by this small circle resolutely doing its own work that adequate ideas will ever get current at all. The rush and roar of practical life will always have a dizzying and attracting effect upon the most collected spectator, and tend to draw him into its vortex; most of all will this be the case where that life is so powerful as it is in England. But it is only by remaining collected, and refusing to lend himself to the point of view of the practical man, that the critic can do the practical man any service; and it is only by the greatest sincerity in pursuing his own course, and by at last convincing even the practical man of his sincerity, that he can escape misunderstandings which perpetually threaten him.

For the practical man is not apt for fine distinctions, and yet in these distinctions truth and the highest culture greatly find their account. But it is not easy to lead a practical man—unless you reassure him as to your practical intentions, you have no chance of leading him—to see a thing which he has always been used to look at from one side only, which he greatly values, and which, looked at from that side, quite deserves, perhaps, all the prizing and admiring which he bestows upon it—that this thing, looked at from another side, may appear must less beneficent and beautiful, and yet retain all its claims to our practical allegiance. Where shall we find language innocent enough, how shall we make the spotless purity of our intentions evident enough, to enable us to say to the political Englishman that the British Constitution itself, which, seen from the practical side, looks such a magnificent organ of progress and virtue, seen from the speculative side—with its compromises, its love of facts, its horror of theory, its studied avoidance of clear thoughts—that, seen from this side, our august Constitution sometimes looks—forgive me, shade of Lord Somers![21]—a colossal machine for the manufacture of Philistines? How is Cobbett[22] to say this and not be misunderstood, blackened as he is with the smoke of a lifelong conflict in the field of political practice? How is Mr. Carlyle[23] to say it and not be misunderstood, after his furious raid into this field with his *Latter-day Pamphlets?* How is Mr. Ruskin,[24] after his pugnacious political economy? I say, the critic must keep out of the region of immediate practice in the political, social, humanitarian sphere, if he wants to make a beginning for that more free speculative treatment of things, which may perhaps one day make its benefits felt even in this sphere, but in a natural and thence irresistible manner.

Do what he will, however, the critic will still remain exposed to frequent misunderstandings, and nowhere so much as in this country. For here people are particularly indisposed even to comprehend that without this free disinterested treatment of things, truth and the highest culture are out of the question. So immersed are they in practical life, so accustomed to take all their notions from this life and its processes, that they are apt to think that truth and culture themselves can be reached by the processes of this life, and that it is an impertinent singularity to think of reaching them in any other. "We are all *terrae filli,*"[25] cries their eloquent advocate; "all Philistines together. Away with the notion of proceeding by any other course than the course dear to the Philistines; let us have a social movement, let us organize and combine a party to pursue truth and new thought, let us call it 'the liberal party,' and let us all stick to each other, and back each other up. Let us have no nonsense about independent criticism, and intellectual delicacy, and the few and the many. Don't let us trouble ourselves about foreign thought; we shall invent the whole thing for ourselves as we go along. If one of us speaks well, applaud him; if one of us speaks ill, applaud him too: we are all in the same movement, we are all liberals, we are all in pursuit of truth." In this way the pursuit of truth becomes really a social, practical, pleasurable affair, almost requiring a chairman, a secretary, and advertisements; with the excitement of an occasional scandal, with a little resistance to give the happy sense of difficulty overcome; but, in general, plenty of bustle and very little thought. To act is so easy, as Goethe says: to think is so hard! It is true that the critic has many temptations to go with the stream, to make one of the party movement, one of these *terrae filli;* it seems ungracious to refuse to be a *terrae filius,* when so many excellent people are; but the critic's duty is to refuse, or, if resistance is vain, at least to cry with Obermann: *"Périssons en résistant."*[26]

How serious a matter it is to try and resist, I had ample opportunity of experiencing when I ventured some time ago to criticize the celebrated first volume of Bishop Colenso.[27] The echoes of the storm which was then raised I still, from time to time, hear grumbling around me. That storm arose out of a misunderstanding almost inevitable. It is a result of no little culture to attain to a clear perception that science and religion are two wholly different things. The multitude will forever confuse them; but happily that is of no great real importance, for while the multitude imagines itself to live by its false science, it does really live by its true religion. Dr. Colenso, however, in his first volume did all he could to strengthen the confusion,[28] and to make it dangerous. He did this with the best intentions, I freely admit, and with the most candid ignorance that this was the natural effect of what he was doing; but, says Joubert, "Ignorance, which in matters of morals extenuates the crime, is itself, in intellectual matters, a crime of the first order."[29] I criticized Bishop Colenso's speculative confusion. Immediately there was a cry raised: "What is this? Here is a liberal attacking a liberal. Do not you belong to the movement? Are not you a friend of truth? Is not Bishop Colenso in pursuit of truth? Then speak with proper respect of his book. Dr. Stanley[30] is another friend of truth, and you speak with proper respect of his book; why make these invidious differences? Both books are excellent, admirable, liberal; Bishop Colenso's perhaps the most so, because it is the boldest, and will have the best practical consequences for the liberal cause. Do you want to encourage to the attack of a brother liberal his, and your, and our implacable enemies, the *Church and State Review* or the *Record*—the High Church rhinoceros and the Evangelical hyena? Be silent, therefore; or rather speak, speak as loud as ever you can! And go into ecstasies over the eighty and odd pigeons."

---

[21] Lord Somers (1650–1716), champion of the English constitution of 1688.

[22] William Cobbett (1762–1835), British journalist and reformer.

[23] Thomas Carlyle, English writer (1795–1881).

[24] John Ruskin (1819–1900), English critic and social theorist.

[25] "Sons of earth."

[26] "Let us perish resisting." Etienne Povert de Senancour (1770–1846), *Obermann.*

[27] Arnold thought superficial *Pentateuch and Book of Joshua Critically Examined* (1863) by John William Colenso (d. 1883), Bishop of Natal. He criticized the book in "The Bishop and the Philosopher," *Macmillan's Magazine* (January 1863). [Arnold] So sincere is my dislike to all personal attack and controversy, that I abstain from reprinting, and this distance of time from the occasion which called them forth, the essays in which I criticized Dr. Colenso's book; I feel bound, however, after all that has passed, to make here a final declaration of my sincere impenitence for having published them. Nay, I cannot forbear repeating yet once more, for his benefit and that of his readers, this sentence from my original remarks upon him: "There is truth of science and truth of religion: truth of science does not become truth of religion till it is made religious." And I will add: Let us have all the science there is from the men of science, from the men of religion, let us have religion.

But criticism cannot follow this coarse and indiscriminate method. It is unfortunately possible for a man in pursuit of truth to write a book which reposes upon a false conception. Even the practical consequences of a book are to genuine criticism no recommendation of it, if the book is, in the highest sense, blundering. I see that a lady[31] who herself, too, is in pursuit of truth, and who writes with great ability, but a little too much, perhaps, under the influence of the practical spirit of the English liberal movement, classes Bishop Colenso's book and M. Renan's[32] together, in her survey of the religious state of Europe, as facts of the same order, works, both of them, of "great importance"; "great ability, power, and skill"; Bishop Colenso's, perhaps, the most powerful; at least, Miss Cobbe gives special expression to her gratitude that to Bishop Colenso "has been given the strength to grasp, and the courage to teach, truths of such deep import." In the same way, more than one popular writer has compared him to Luther. Now it is just this kind of false estimate which the critical spirit is, it seems to me, bound to resist. It is really the strongest possible proof of the low ebb at which, in England, the critical spirit is, that while the critical hit in the religious literature of Germany is Dr. Strauss's book,[33] in that of France M. Renan's book, of Bishop Colenso is the critical hit in the religious literature of England. Bishop Colenso's book reposes on a total misconception of the essential element of the religious problem, as that problem is now presented for solution. To criticism, therefore, which seeks to have the best that is known and thought on this problem, it is, however well meant, of no importance whatever. M. Renan's book attempts a new synthesis of the elements furnished to us by the four gospels. It attempts, in my opinion, a synthesis, perhaps premature, perhaps impossible, certainly not successful. Up to the present time, at any rate, we must acquiesce in Fleury's sentence on such recastings of the Gospel story: *"Quiconque s'imagine la pouvoir mieux écrire, ne l'entend pas."*[34] M. Renan had himself passed by anticipation a like sentence on his own work, when he said: "If a new presentation of the character of Jesus were offered to me, I would not have it; its very clearness would be, in my opinion, the best proof of its insufficiency." His friends may with perfect justice rejoin that at the sight of the Holy Land, and of the actual scene of the Gospel story, all the current of M. Renan's thoughts may have naturally changed, and a new casting of that story irresistibly suggested itself to him; and that this is just a case for applying Cicero's maxim: Change of mind is not inconsistency—*"nemo doctus unquam mutationem consilii inconstantiam dixit esse."*[35] Nevertheless, for criticism, M. Renan's first thought must still be the truer one, as long as his new casting so fails more fully to commend itself, more fully (to use Coleridge's happy phrase about the Bible[36]) to *find* us. Still M. Renan's attempt is, for criticism, of the most real interest and importance, since, with all its difficulty, a fresh synthesis of the New Testament data—not a making war on them, in Voltaire's fashion, not a leaving them out of mind, in the world's fashion, but the putting a new construction upon them, the taking them from under the old, traditional, conventional point of view and placing them under a new one—is the very essence of the religious problem, as now presented: and only by efforts in this direction can it receive a solution.

Again, in the same spirit in which she judges Bishop Colenso, Miss Cobbe, like so many earnest liberals of our practical race, both here and in America, herself sets vigorously about a positive reconstruction of religion, about making a religion of the future out of hand, or at least setting about making it. We must not rest, she and they are always thinking and saying, in negative criticism, we must be creative and constructive; hence we have such works as her recent *Religious Duty,* and works still more considerable, perhaps, by others, which will be in everyone's mind. These works often have much ability; they often spring out of sincere convictions, and a sincere wish to do good; and they sometimes, perhaps, do good. Their fault is (if I may be permitted to say so) one which they have in common with the British College of Health, in the New Road. Everyone knows the British College of Health; it is that building with the lion and the statue of the Goddess Hygeia before it; at least I am sure about the lion, though I am not absolutely certain about the Goddess Hygeia. This building does credit, perhaps, to the resources of Dr. Morrison and his disciples; but it falls a good deal short of one's idea of what a British College of Health ought to be. In England, where we hate public interference and love individual enterprise, we have a whole crop of places like the British College of Health; the grand name without the grand thing. Unluckily, creditable to individual enterprise as they are, they tend to impair our taste by making us forget what more grandiose, noble, or beautiful character properly belongs to a public institution. The same may be said of the religions of the future of Miss Cobbe and others. Creditable, like the British College of Health, to the resources of their authors, they yet tend to make us forget what more grandiose, noble, or beautiful character properly belongs to religious constructions. The historic religions, with all their faults, have had this; it certainly belongs to the religious sentiment, when it truly flowers, to have this; and we impoverish our spirit if we allow a religion of the future without it. What then is the duty of criticism here? To take the practical point of view, to applaud the liberal movement and all its works—its New Road religions of the future into the bargain—for their general utility's sake? By no means; but to be perpetually dissatisfied with these works, while they perpetually fall short of a high and perfect ideal.

---

[28] [Arnold] It has been said I make it "a crime against literary criticism and the higher culture to attempt to inform the ignorant." Need I point out that the ignorant are not informed by being confirmed in a confusion?

[29] *Pensees* I, 311.

[30] Arthur Penrhyn Stanley. Arnold had compared his *The Bible: Its Form and Substance* (1863) favorably to Colenso's.

[31] Frances Power Cobbe (b. 1822), writer and lecturer. Arnold is referring to her *Broken Lights* (1864).

[32] Ernest Renan (1823–1892), French historian and philologist, *The Life of Jesus* (1835).

[33] David Friedrich Strauss (1808–1874), German theologian, *Life of Jesus* (1835).

[34] "Whoever imagines that he can write it better, does not understand it."

[35] Cicero (above, page 74), *Letters to Atticus* XV, 7: "No learned man has said it is inconsistent to change his mind."

[36] In his *Confessions of an Inquiring Spirit* (posthumously published, 1840).

For criticism, these are elementary laws; but they never can be popular, and in this country they have been very little followed, and one meets with immense obstacles in following them. That is a reason for asserting them again and again. Criticism must maintain its independence of the practical spirit and its aims. Even with well-meant efforts of the practical spirit it must express dissatisfaction, if in the sphere of the ideal they seem impoverishing and limiting. It must not hurry on to the goal because of its practical importance. It must be patient, and know how to wait; and flexible, and know how to attach itself to things and how to withdraw from them. It must be apt to study and praise elements that for the fullness of spiritual perfection are wanted, even though they belong to a power which in the practical sphere may be maleficent. It must be apt to discern the spiritual shortcomings or illusions of powers that in the practical sphere may be beneficent. And this without any notion of favoring or injuring, in the practical sphere, one power or the other; without any notion of playing off, in this sphere, one power against the other. When one looks, for instance, at the English divorce court—an institution which perhaps has its practical conveniences, but which in the ideal sphere is so hideous; an institution which neither makes divorce impossible nor makes it decent, which allows a man to get rid of his wife, or a wife of her husband, but makes them drag one another first, for the public edification, through a mire of unutterable infamy—when one looks at this charming institution, I say, with its crowded trials, its newspaper reports, and its money compensations, this institution in which the gross unregenerate British Philistine has indeed stamped an image of himself—one may be permitted to find the marriage theory of Catholicism refreshing and elevating. Or when Protestantism, in virtue of its supposed rational and intellectual origin, gives the law to criticism too magisterially, criticism may and must remind it that its pretensions, in this respect, are illusive and do it harm; that the Reformation was a moral rather than an intellectual event; that Luther's theory of grace no more exactly reflects the mind of the spirit than Bossuet's philosophy of history reflects it;[37] and that there is no more antecedent probability of the Bishop of Durham's stock of ideas being agreeable to perfect reason than of Pope Pius the Ninth's. But criticism will not on that account forget the achievements of Protestantism in the practical and moral sphere; nor that, even in the intellectual sphere, Protestantism, though in a blind and stumbling manner, carried forward the Renaissance, while Catholicism threw itself violently across its path.

I lately heard a man of thought and energy contrasting the want of ardor and movement which he now found amongst young men in this country with what he remembered in his own youth, twenty years ago. "What reformers we were then!" he exclaimed; "what a zeal we had! How we canvassed every institution in Church and State, and were prepared to remodel them all on first principles!" He was inclined to regret, as a spiritual flagging, the lull which he saw. I am disposed rather to regard it as a pause in which the turn to a new mode of spiritual progress is being accomplished. Everything was long seen, by the young and ardent amongst us, in inseparable connection with politics and practical life. We have pretty well exhausted the benefits of seeing things in this connection, we have got all that can be got by so seeing them. Let us try a more disinterested mode of seeing them; let us betake ourselves more to the serener life of the mind and spirit. This life, too, may have its excesses and dangers; but they are not for us at present. Let us think of quietly enlarging our stock of true and fresh ideas, and not, as soon as we get an idea or half an idea, be running out with it into the street, and trying to make it rule there. Our ideas will, in the end, shape the world all the better for maturing a little. Perhaps in fifty years' time it will in the English House of Commons be an objection to an institution that it is an anomaly, and my friend the Member of Parliament will shudder in his grave. But let us in the meanwhile rather endeavor that in twenty years' time it may, in English literature, be an objection to a proposition that it is absurd. That will be a change so vast, that the imagination almost fails to grasp it. *"Ab integro saeclorum nascitur ordo."*[38]

---

[37] In his *Discourse on Universal History* (1681) Jacques Benigne Bossuet (1627–1704) explains history as divinely guided to the benefit of Catholicism.

If I have insisted so much on the course which criticism must take where politics and religion are concerned, it is because, where these burning matters are in question, it is most likely to go astray. I have wished, above all, to insist on the attitude which criticism should adopt towards things in general; on its right tone and temper of mind. But then comes another question as to the subject matter which literary criticism should most seek. Here, in general, its course is determined for it by the idea which is the law of its being; the idea of a disinterested endeavor to learn and propagate the best that is known and thought in the world, and thus to establish a current of fresh and true ideas. By the very nature of things, as England is not all the world, much of the best that is known and thought in the world cannot be of English growth, must be foreign; by the nature of things, again, it is just this that we are least likely to know, while English thought is streaming in upon us from all sides, and takes excellent care that we shall not be ignorant of its existence. The English critic of literature, therefore, must dwell much on foreign thought, and with particular heed on any part of it, which, while significant and fruitful in itself, is for any reason specially likely to escape him. Again, judging is often spoken of as the critic's one business, and so in some sense it is; but the judgment which almost insensibly forms itself in a fair and clear mind, along with fresh knowledge, is the valuable one; and thus knowledge, and ever fresh knowledge, must be the critic's great concern for himself. And it is by communicating fresh knowledge, and letting his own judgment pass along with it—but insensibly, and in the second place, not the first, as a sort of companion and clue, not as an abstract lawgiver—that the critic will generally do most good to his readers. Sometimes, no doubt, for the sake of establishing an author's place in literature, and his relation to a central standard (and if this is not done, how are we to get at our "best in the world"?) criticism may have to deal with a subject matter so familiar that fresh knowledge is out of the question, and then it must be all judgment; an enunciation and detailed application of principles. Here the great safeguard is never to let oneself become abstract, always to retain an intimate and lively consciousness of the truth of what one is saying, and, the moment this fails us, to be sure that something is wrong. Still, under all circumstances, this mere judgment and application of principles is, in itself, not the most satisfactory work to the critic; like mathematics, it is tautological, and cannot well give us, like fresh learning, the sense of creative activity.

But stop, someone will say; all this talk is of no practical use to us whatever; this criticism of yours is not what we have in our minds when we speak of criticism; when we speak of critics and criticism, we mean critics and criticism of the current English literature of the day; when you offer to tell criticism its function, it is to this criticism that we expect you to address yourself. I am sorry for it, for I am afraid I must disappoint these expectations. I am bound by my own definition of criticism: "a disinterested endeavor to learn and propagate the best that is known and thought in the world." How much of current English literature comes into this "best that is known and thought in the world"? Not very much I fear; certainly less, at this moment, than of the current literature of France or Germany. Well, then, am I to alter my definition of criticism, in order to meet the requirements of a number of practicing English critics, who, after all, are free in their choice of a business? That would be making criticism lend itself just to one of those alien practical considerations, which, I have said, are so fatal to it. One may say, indeed, to those who have to deal with the mass—so much better disregarded—of current English literature, that they may at all events endeavor, in dealing with this, to try it, so far as they can, by the standard of the best that is known and thought in the world; one may say, that to get anywhere near this standard, every critic should try and possess one great literature, at least, besides his own; and the more unlike his own, the better. But, after all, the criticism I am really concerned with—the criticism which alone can much help us for the future, the criticism which, throughout Europe, is at the present day meant, when so much stress is laid on the importance of criticism and the critical spirit—is a criticism which regards Europe as being, for intellectual and spiritual purposes, one great confederation, bound to a joint action and working to a common result; and whose members have, for their proper outfit, a knowledge of Greek, Roman, and Eastern antiquity, and of one another. Special, local, and temporary advantages being put out of account, that modern nation will in the intellectual and spiritual sphere make most progress, which most thoroughly carries out this program. And what is that but saying that we too, all of us, as individuals, the more thoroughly we carry it out, shall make the more progress?

---

[38] "Order is born from the renewal of generations." Virgil, *Eclogues* IV, 5.

There is so much inviting us! What are we to take? What will nourish us in growth towards perfection? That is the question which, with the immense field of life and of literature lying before him, the critic has to answer; for himself first, and afterwards for others. In this idea of the critic's business the essays brought together in the following pages have had their origin; in this idea, widely different as are their subjects, they have, perhaps, their unity.

I conclude with what I said at the beginning: to have the sense of creative activity is the great happiness and the great proof of being alive, and it is not denied to criticism to have it; but then criticism must be sincere, simple, flexible, ardent, ever widening its knowledge. Then it may have, in no contemptible measure, a joyful sense of creative activity; a sense which a man of insight and conscience will prefer to what he might derive from a poor, starved, fragmentary, inadequate creation. And at some epochs no other creation is possible.

Still, in full measure, the sense of creative activity belongs only to genuine creation; in literature we must never forget that. But what true man of letters ever can forget it? It is no such common matter for a gifted nature to come into possession of a current of true and living ideas, and to produce amidst the inspiration of them, that we are likely to underrate it. The epochs of Aeschylus and Shakespeare make us feel their preeminence. In an epoch like those is, no doubt, the true life of literature; there is the promised land, towards which criticism can only beckon. That promised land it will not be ours to enter, and we shall die in the wilderness: but to have desired to enter it, to have saluted it from afar, is already, perhaps, the best distinction among contemporaries; it will certainly be the best title to esteem with posterity.

The Study of Poetry

> The future of poetry is immense, because in poetry, where it is worthy of its high destinies, our race, as time goes on, will find an ever surer and surer stay. There is not a creed which is not shaken, not an accredited dogma which is not shown to be questionable, not a received tradition which does not threaten to dissolve. Our religion has materialized itself in the fact, in the supposed fact; it has attached its emotion to the fact, and now the fact is failing it. But for poetry the idea is everything; the rest is a world of illusion, of divine illusion. Poetry attaches its emotion to the idea; the idea *is* the fact. The strongest part of our religion today is its unconscious poetry.[1]

Let me be permitted to quote these words of my own, as uttering the thought which should, in my opinion, go with us and govern us in all our study of poetry. In the present work it is the course of one great contributory stream to the world river of poetry that we are invited to follow. We are here invited to trace the stream of English poetry. But whether we set ourselves, as here, to follow only one of the several streams that make the mighty river of poetry, or whether we seek to know them all, our governing thought should be the same. We should conceive of poetry worthily, and more highly than it has been the custom to conceive of it. We should conceive of it as capable of higher uses, and called to higher destinies, than those which in general men have assigned to it hitherto. More and more mankind will discover that we have to turn to poetry to interpret life for us, to console us, to sustain us. Without poetry, our science will appear incomplete; and most of what now passes with us for religion and philosophy will be replaced by poetry. Science, I say, will appear incomplete without it. For finely and truly does Wordsworth call poetry "the impassioned expression which is in the countenance of all science"; and what is a countenance without its expression? Again, Wordsworth finely and truly calls poetry "the breath and finer spirit of all knowledge";[2] our religion, parading evidences such as those on which the popular mind relies now; our philosophy, pluming

---

Arnold's *Study of Poetry* was first published in 1880. The selection reprinted here represents approximately the first half of the essay.

[1] Introduction to *The Hundred Greatest Men.*

[2] Preface to the second edition of *Lyrical Ballads* (above, page 487).

itself on its reasonings about causation and finite and infinite being; what are they but the shadows and dreams and false shows of knowledge? The day will come when we shall wonder at ourselves for having trusted to them, for having taken them seriously; and the more we perceive their hollowness, the more we shall prize "the breath and finer spirit of knowledge" offered to us by poetry.

But if we conceive thus highly of the destinies of poetry, we must also set our standard for poetry high, since poetry, to be capable of fulfilling such high destinies, must be poetry of a high order of excellence. We must accustom ourselves to a high standard and to a strict judgment. Sainte-Beuve relates that Napoleon one day said, when somebody was spoken of in his presence as a charlatan: "Charlatan as much as you please; but where is there *not* charlatanism?" "Yes," answers Sainte-Beuve,[3] "in politics, in the art of governing mankind, that is perhaps true. But in the order of thought, in art, the glory, the eternal honor is that charlatanism shall find no entrance; herein lies the inviolableness of that noble portion of man's being." It is admirably said, and let us hold fast to it. In poetry, which is thought and art in one, it is the glory, the eternal honor, that charlatanism shall find no entrance; that this noble sphere be kept inviolate and inviolable. Charlatanism is for confusing or obliterating the distinctions between excellent and inferior, sound and unsound or only half-sound, true and untrue or only half-true. It is charlatanism, conscious or unconscious, whenever we confuse or obliterate these. And in poetry, more than anywhere else, it is unpermissible to confuse or obliterate them. For in poetry the distinction between excellent and inferior, sound and unsound or only half-sound, true and untrue or only half-true, is of paramount importance. It is of paramount importance because of the high destinies of poetry. In poetry, as in criticism of life under the conditions fixed for such a criticism by the laws of poetic truth and poetic beauty, the spirit of our race will find, we have said, as time goes on and as other helps fails, its consolation and stay. But the consolation and stay will be of power in proportion to the power of the criticism of life. And the criticism of life will be of power in proportion as the poetry conveying it is excellent rather than inferior, sound rather than unsound or half-sound, true rather than untrue or half-true.

The best poetry is what we want; the best poetry will be found to have a power of forming, sustaining, and delighting us, as nothing else can. A clearer, deeper sense of the best in poetry, and of the strength and joy to be drawn from it, is the most precious benefit which we can gather from a poetical collection such as the present. And yet in the very nature and conduct of such a collection there is inevitably something which tends to obscure in us the consciousness of what our benefit should be, and to distract us from the pursuit of it. We should therefore steadily set it before our minds at the outset, and should compel ourselves to revert constantly to the thought of it as we proceed.

Yes; constantly in reading poetry, a sense for the best, the really excellent, and of the strength and joy to be drawn from it, should be present in our minds and should govern our estimate of what we read. But this real estimate, the only true one, is liable to be superseded, if we are not watchful, by two other kinds of estimate, the historic estimate and the personal estimate, both of which are fallacious. A poet or a poem may count to us historically, they may count to us on grounds personal to ourselves, and they may count to us really. They may count to us historically. The course of development of a nation's language, thought, and poetry, is profoundly interesting; and by regarding a poet's work as a stage in this course of development we may easily bring ourselves to make it of more importance as poetry than in itself it really is, we may come to use a language of quite exaggerated praise in criticizing it; in short, to overrate it. So arises in our poetic judgments the fallacy caused by the estimate which we may call historic. Then, again, a poet or poem may count to us on grounds personal to ourselves. Our personal affinities, likings and circumstances, have great power to sway our estimate of this or that poet's work, and to make us attach more importance to it as poetry than in itself it really possesses, because to us it is, or has been, of high importance. Here also we overrate the object of our interest, and apply to it a language of praise which is quite exaggerated. And thus we get the source of a second fallacy in our poetic judgments—the fallacy caused by an estimate which we may call personal.

Both fallacies are natural. It is evident how naturally the study of the history and development of poetry may incline a man to pause over reputations and works once conspicuous but now obscure, and to quarrel with a careless public for skipping, in obedience to mere tradition and habit, from one famous name or work in its national poetry to another, ignorant of what it misses, and of the reason for keeping what it keeps, and of the whole process of growth in its poetry. The French have become diligent students of their own early poetry, which they long neglected; the study makes many of them dissatisfied with their so-called classical poetry, the court-tragedy of the seventeenth century, a poetry which Pellisson long ago reproached with its want of the true poetic stamp, with its *politesse stérile et rampante,*[4] but which nevertheless has reigned in France as absolutely as if it had been the perfection of classical poetry indeed. The dissatisfaction is natural; yet a lively and accomplished critic, M. Charles d'Héricault, the editor of Clément Marot,[5] goes too far when he says that "the cloud of glory playing round a classic is a mist as dangerous to the future of a literature as it is intolerable for the purpose of history." "It hinders," he goes on,

---

[3] Charles Augustin Sainte-Beuve (1804–1869), French critic.

[4] "Sterile and servile politeness."

> it hinders us from seeing more than one single point, the culminating and exceptional point; the summary, fictitious and arbitrary, of a thought and of a work. It substitutes a halo for a physiognomy, it puts a statue where there was once a man, and hiding from us all trace of the labor, the attempts, the weaknesses, the failures, it claims not study but veneration; it does not show us how the thing is done, it imposes upon us a model. Above all, for the historian this creation of classic personages is inadmissible; for it withdraws the poet from his time, from his proper life, it breaks historical relationships, it blinds criticism by conventional admiration, and renders the investigation of literary origins unacceptable. It gives us a human personage no longer but a God seated immovable amidst his perfect work, like Jupiter on Olympus; and hardly will it be possible for the young student to whom such work is exhibited at such a distance from him, to believe that it did not issue ready-made from that divine head.

All this is brilliantly and tellingly said, but we must plead for a distinction. Everything depends on the reality of a poet's classic character. If he is a dubious classic, let us sift him; if he is a false classic, let us explode him. But if he is a real classic, if his work belongs to the class of the very best (for this is the true and right meaning of the word *classic, classical*), then the great thing for us is to feel and enjoy his work as deeply as ever we can, and to appreciate the wide difference between it and all work which has not the same high character. This is what is salutary, this is what is formative; this is the great benefit to be got from the study of poetry. Everything which interferes with it, which hinders it, is injurious. True, we must read our classic with open eyes, and not with eyes blinded with superstition; we must perceive when his work comes short, when it drops out of the class of the very best, and we must rate it, in such cases, at its proper value. But the use of this negative criticism is not in itself, it is entirely in its enabling us to have a clearer sense and a deeper enjoyment of what is truly excellent. To trace the labor, the attempts, the weaknesses, the failures of a genuine classic, to acquaint oneself with his time and his life and his historical relationships, is mere literary dilettantism unless it has that clear sense and deeper enjoyment for its end. It may be said that the more we know about a classic the better we shall enjoy him; and, if we lived as long as Methuselah and had all of us heads of perfect clearness and wills of perfect steadfastness, this might be true in fact as it is plausible in theory. But the case here is much the same as the case with the Greek and Latin studies of our schoolboys. The elaborate philological groundwork which we require them to lay is in theory an admirable preparation for appreciating the Greek and Latin authors worthily. The more thoroughly we lay the groundwork, the better we shall be able, it may be said, to enjoy the authors. True, if time were not so short, and schoolboys' wits not so soon tired and their power of attention exhausted; only, as it is, the elaborate philological preparation goes on, but the authors are little known and less enjoyed. So with the investigator of "historic origins" in poetry. He ought to enjoy the true classic all the better for his investigations; he often is distracted from the enjoyment of the best, and with the less good he overbusies himself, and is prone to overrate it in proportion to the trouble which it has cost him.

The idea of tracing historic origins and historical relationships cannot be absent from a compilation like the present. And naturally the poets to be exhibited in it will be assigned to those persons for exhibition who are known to prize them highly, rather than to those who have no special inclination towards them. Moreover, the very occupation with an author, and the business of exhibiting him, disposes us to affirm and amplify his importance. In the present work, therefore, we are sure of frequent temptation to adopt the historic estimate, or the personal estimate, and to forget the real estimate; which latter, nevertheless, we must employ if we are to make poetry yield us its full benefit. So high is that benefit, the benefit of clearly feeling and of deeply enjoying the really excellent, the truly classic in poetry, that we do well, I say, to set it fixedly before our minds as our object in studying poets and poetry, and to make the desire of attaining it the one principle to which, as the *Imitation* says, whatever we may read or come to know, we always return. *"Cum multa legeris et cognoveris, ad unum semper oportet redire principium."*[6]

---

[5] Charles d'Hericault (1823–1899), French scholar; Clement Marot (1496?–1544), French poet.

[6] "With much reading and learning one must always return to the one principle." Thomas a Kempis (1379?–1471), German monk, *The Imitation of Christ.*

The historic estimate is likely in especial to affect our judgment and our language when we are dealing with ancient poets; the personal estimate when we are dealing with poets our contemporaries, or at any rate modern. The exaggerations due to the historic estimate are not in themselves, perhaps, of very much gravity. Their report hardly enters the general ear; probably they do not always impose even on the literary men who adopt them. But they lead to a dangerous abuse of language. So we hear Caedmon, amongst our own poets, compared to Milton.[7] I have already noticed the enthusiasm of one accomplished French critic for "historic origins." Another eminent French critic, M. Vitet, comments upon that famous document of the early poetry of his nation, the *Chanson de Roland*. It is indeed a most interesting document. The *joculator* or *jongleur Taillefer*, who was with William the Conqueror's army at Hastings, marched before the Norman troops, so said the tradition, singing "of Charlemagne and of Roland and of Oliver, and of the vassals who died at Roncevaux"; and it is suggested that in the *Chanson de Roland* by one Turoldus or Théroulde, a poem preserved in a manuscript of the twelfth century in the Bodleian Library at Oxford, we have certainly the matter, perhaps even some of the words, of the chant which Taillefer sang. The poem has vigor and freshness; it is not without pathos. But M. Vitet is not satisfied with seeing in it a document of some poetic value, and of very high historic and linguistic value; he sees in it a grand and beautiful work, a monument of epic genius. In its general design he finds the grandiose conception, in its details he finds the constant union of simplicity with greatness, which are the marks, he truly says, of the genuine epic, and distinguish it from the artificial epic of literary ages. One thinks of Homer; this is the sort of praise which is given to Homer, and justly given. Higher praise there cannot well be, and it is the praise due to epic poetry of the highest order only, and to no other. Let us try, then, the *Chanson de Roland* at its best. Roland, mortally wounded, lay himself down under a pine tree, with his face turned towards Spain and the enemy—

De plusurs choses à remembrer li prist,
De tantes teres cume li bers cunquist,
De dulce France, des humes de sun lign,
De Carlemagne sun seignor ki l'nurrit.[8]

That is primitive work, I repeat, with an undeniable poetic quality of its own. It deserves such praise, and such praise is sufficient for it. But now turn to Homer—Ὡς φάτο. τοὺIς δ' ἤδη κατέχεν φυσίζοος αἶα / ἐν Λακεδαίμονι αὖδι, φίλῃ ἐν πατρίδι γαίῃ.[9] We are here in another world, another order of poetry altogether; here is rightly due such supreme praise as that which M. Vitet gives to the *Chanson de Roland*. If our words are to have any meaning, if our judgments are to have any solidity, we must not heap that supreme praise upon poetry of an order immeasurably inferior.

Indeed there can be no more useful help for discovering what poetry belongs to the class of the truly excellent, and can therefore do us most good, than to have always in one's mind lines and expressions of the great masters, and to apply them as a touchstone to other poetry. Of course we are not to require this other poetry to resemble them; it may be very dissimilar. But if we have any tact we shall find them, when we have lodged them well in our minds, an infallible touchstone for detecting the presence or absence of high poetic quality, and also the degree of this quality, in all other poetry which we may place beside them. Short passages, even single lines, will serve our turn quite sufficiently. Take the two lines which I have just quoted from Homer, the poet's comment on Helen's mention of her brothers; or take his

Α δειλώ, τί σφῶϊ δόμεν Πηλῆϊ ἄνακτι
Θνητῷ; ὑηεῖς δὲοτὸν ἀγήρω τ' ἀθανάτω τε.
ἦ ἵνα δυοτήνοισι μετ' ἀνδράσιν ἄλγε' ἔχητον;[10]

the address of Zeus to the horses of Peleus; or take finally his Καὶ σέ, γέρον, τὸ πρὶν μὲν ἀκούομεν ὄλβιον εἶναι,[11] the words of Achilles to Priam, a suppliant before him. Take that incomparable line and a half of Dante, Ugolino's tremendous words—*"Io no piangeva; sì dentro impietrai. / Piangevan elli . . ."*[12] take the lovely words of Beatrice to Virgil—

Io son fatta da Dio, sua mercè, tale,
Che la vostra miseria non mi tange,
Nè fiamma d'esto incendio non m'assale . . .[13]

---

[7] Caedmon (fl. 630) and John Milton (1608–1674), English poets.

[8] [Arnold] "Then began he to call many things to remembrance—all the lands which his valor conquered and pleasant France, and the men of his lineage, and Charlemagne his liege lord who nourished him." *Chanson de Roland* III, 939–42.

[9] [Arnold] "So said she, they long since in earth's soft arms were reposing there in their own dear land, their fatherland, Lacadaemon." *Iliad* III, 243–44 (translated by Dr. Hawtrey).

[10] [Arnold] "Ah, unhappy pair, why gave we you to King Peleus, to a mortal? But ye are without old age, and immortal. Was it that with men born to misery ye might have sorrow?" *Iliad* XXIV, 543.

[11] [Arnold] "And you, too, old man, were, as we have heard, happy in former days." *Iliad* XXIV, 543.

[12] [Arnold] "I wailed not, so of stone grew I within. They wailed." *The Divine Comedy*, "Inferno" XXXIII, 39–40.

[13] [Arnold] "Of such sort hath God, thanked be his mercy, made me, that your misery toucheth me not, neither doth the flame of this fire strike me." *The Divine Comedy*, "Inferno" II, 91–93.

take the simple, but perfect, single line—*"In la sua volontade è nostra pace."*[14] Take of Shakespeare a line or two of Henry the Fourth's expostulation with sleep—

> Wilt thou upon the high and giddy mast
> Seal up the ship-boy's eyes, and rock his brains
> In cradle of the rude imperious surge . . .[15]

and take, as well, Hamlet's dying request to Horatio—

> If thou didst ever hold me in thy heart,
> Absent thee from felicity awhile,
> And in this harsh world draw thy breath in pain
> To tell my story . . .[16]

Take of Milton that Miltonic passage:

> Darkened so, yet shone
> Above them all the archangel; but his face
> Deep scars of thunder had intrenched, and care
> Sat on his faded cheek . . .[17]

add two such lines as "And courage never to submit or yield / And what is else not to be overcome . . ."[18] and finish with the exquisite close to the loss of Proserpine, the loss ". . . which cost Ceres all that pain / To seek her through the world."[19] These few lines, if we have tact and can use them, are enough even of themselves to keep clear and sound our judgments about poetry, to save us from fallacious estimates of it, to conduct us to a real estimate.

The specimens I have quoted differ widely from one another, but they have in common this: the possession of the very highest poetical quality. If we are thoroughly penetrated by their power, we shall find that we have acquired a sense enabling us, whatever poetry may be laid before us, to feel the degree in which a high poetical quality is present or wanting there. Critics give themselves great labor to draw out what in the abstract constitutes the characters of a high quality of poetry. It is much better simply to have recourse to concrete examples; to take specimens of poetry of the high, the very highest quality, and to say: The characters of a high quality of poetry are what is expressed *there.* They are far better recognized by being felt in the verse of the master, than by being perused in the prose of the critic. Nevertheless if we are urgently pressed to give some critical account of them, we may safely, perhaps, venture on laying down, not indeed how and why the characters arise, but where and in what they arise. They are in the matter and substance of the poetry, and they are in its manner and style. Both of these, the substance and matter on the one hand, the style and manner on the other, have a mark, an accent, of high beauty, worth, and power. But if we are asked to define this mark and accent in the abstract, our answer must be: No, for we should thereby be darkening the question, not clearing it. The mark and accent are as given by the substance and matter of that poetry, by the style and manner of that poetry, and of all other poetry which is akin to it in quality.

Only one thing we may add as to the substance and matter of poetry, guiding ourselves by Aristotle's profound observation that the superiority of poetry over history consists in its possessing a higher truth and a higher seriousness (ψιλοσοψώτερον καὶ σπουδαιότερον).[20] Let us add, therefore, to what we have said, this: that the substance and matter of the best poetry acquire their special character from possessing, in an eminent degree, truth and seriousness. We may add yet further, what is in itself evident, that to the style and manner of the best poetry their special character, their accent, is given by their diction, and, even yet more, by their movement. And though we distinguish between the two characters, the two accents, of superiority, yet they are nevertheless vitally connected one with the other. The superior character of truth and seriousness, in the matter and substance of the best poetry, is inseparable from the superiority of diction and movement marking its style and manner. The two superiorities are closely related, and are in steadfast proportion one to the other. So far as high poetic truth and seriousness are wanting to a poet's matter and substance, so far also, we may be sure, will a high poetic stamp of diction and movement be wanting to his style and manner. In proportion as this high stamp of diction and movement, again, is absent from a poet's style and manner, we shall find, also, that high poetic truth and seriousness are absent from his substance and matter.[21]

[20] This is not quite what Aristotle said (above, page 57).

[21] In the rest of the essay Arnold proceeds, with the principles already enunciated in view, to "follow rapidly from the commencement the course of our English poetry."

Charles Baudelaire

1821–1867

The French poet Baudelaire was an art critic of considerable power. The selections below from *The Salon of 1859* have to do with painting, but the ideas are applicable to literary works as well. For Baudelaire the imagination is the "queen of faculties." He thinks of it as a truly creative power. Though nature is full of potential meaning that generates a sort of occult wonder (see his famous sonnet *Correspondences*), it is but a dictionary that must be used to construct our experience. The imagination must shape what nature makes available to it.

Baudelaire's view is post-Kantian and post-Romantic. Nature is a sort of manifold of sensation, in Kant's terms, that is given significance by the power of human beings. When nature is thought of as a dictionary—a mere source of the basic elements of a work of art—copying nature is at best a trivial undertaking; man must breathe his own life into his experience and his art.

An early symbolist, Baudelaire displays a criticism that has definite intellectual links with the discussion of symbols by Coleridge and Carlyle and with Emerson's view of the relationship of poetry to nature. His work precedes Mallarme's remark that "all earthly existence must ultimately be contained in a book."

Baudelaire's literary criticism is available in *Baudelaire as a Literary Critic,* translated and edited by L. B. Hyslop and F. E. Hyslop (1964), and *The Mirror of Art: Critical Studies by Baudelaire,* translated and edited by Jonathan Mayne (1956). The Salon of 1859

from

Part III

The Queen of Faculties

In recent years we have heard it said in a thousand different ways: "Copy nature; copy only nature. There is no greater delight, no finer triumph, than an excellent copy of nature." And this doctrine, so inimical to art, was alleged to apply not only to painting but to all the arts, even to the novel, even to poetry. To these doctrinaires so satisfied with nature, an imaginative man would certainly have had the right to answer: "I consider it useless and tiresome to portray things as they are, because nothing that exist satisfies me. Nature is ugly, and I prefer the monsters of my imagination to the triteness of actuality." It would have been more philosophical, however, to ask these dogmatists, first whether they are really certain of the existence of external nature,[1] or in case

---

Baudelaire's *Salon de 1859* appeared in 1859. The text is from *Baudelaire as a Literary Critic,* translated and edited by Lois Boe Hyslop and Francis E. Hyslop, Jr., (University Park: The Pennsylvania State University Press, 1964).

[1] George Berkeley (1685–1753), Anglo-Irish philosopher, and his epistemological idealism seem to be the source of this question.

this question seemed too well calculated to please their caustic humor, whether they are quite certain of knowing *all nature,* all that is contained in nature. A "yes" would have been the most boastful and the most absurd of answers. If I have correctly understood these strange and degrading divagations, the doctrine meant, at least I am doing it the honor of believing that it meant: "The artist, the true artist, the true poet, should paint only in accordance with what he sees and what he feels. He should be *really* true to his own nature. He should avoid, like death itself, borrowing the eyes and emotions of another man, however great that man may be; for in that case his productions would be lies, so far as he is concerned, and not *realities.*" But if the pedants of whom I am speaking (there is pedantry even in what is contemptible) and who have representatives everywhere—since this theory flatters impotence and indolence alike—if these pedants did not wish the matter to be understood in this way, let us simply believe that they meant: "We have no imagination, and we decree that no one shall have any."

How mysterious is this queen of faculties! It affects all the other faculties; it rouses them, it sends them into combat. Sometimes it resembles them to the point of confusion, and yet it is always very much itself, and the persons who are not stirred by it are easily recognizable by an indefinable curse which withers their productions like the fig tree of the Gospel.

It is analysis, it is synthesis; and yet men who excel in analysis and who are fairly apt in summarizing may lack imagination. It is that, and it is not altogether that. It is sensitivity, and yet there are very sensitive persons, too sensitive perhaps, who are devoid of it. It is imagination that has taught man the moral meaning of color, of outline, of sound, and of perfume. In the beginning of the world it created analogy and metaphor. It decomposes all creation, and from the materials, accumulated and arranged according to rules whose origin is found only in the depths of the soul, it creates a new world, it produces the sensation of the new.[2] Since it has created the world (this can really be said, I believe, even in a religious sense), it is only right that it should govern it. What do people say about a warrior without imagination? That he may make an excellent soldier, but that if he is put in command of armies, he will make no conquests. The case is like that of a poet or a novelist who might take the command of his faculties away from his imagination to give it, for example, to his knowledge of the language or to his observation of facts. What is said of a diplomat without imagination? That he may know all about the history of treaties and alliances in the past, but that he will not sense the treaties and alliances that may evolve in the future. Of a scholar without imagination? That he has learned everything that could be learned from what he was taught, but that he will not discover laws that have not yet been conceived. Imagination is the queen of truth, and the possible is one of the provinces of truth. It has a definite relationship with the infinite.

Without it, all the faculties, however sound or keen they may be, are seemingly nonexistent, whereas the weakness of certain secondary faculties, when excited by a vigorous imagination, is a secondary misfortune. None of the faculties can do without it, and it can even replace some of the others. Imagination often guesses, boldly and simply, what the secondary faculties seek and find only after successive trials of several methods unadapted to the nature of things. Lastly, it plays a powerful role even in morality; for if I may be so bold as to ask—what is virtue without imagination? You might as well speak of virtue without pity, virtue without heaven; it is something hard, cruel, sterilizing, which in certain countries has become bigotry and in certain others, Protestantism.

from
Part IV

The Rule of the Imagination

Yesterday evening, after having sent you the last pages of my letter, in which I had written, not without a certain diffidence: "Since imagination has created the world, it governs it." I was scanning *The Night Side of Nature*[3] and I came across these lines which I am quoting solely because they are a paraphrase justifying the line that was worrying me:

> By *imagination,* I do not simply mean to convey the common notion implied by that much abused word, which is only *fancy,* but the *constructive* imagination, which is a much higher function, and which, inasmuch as man is made in the likeness of God, bears a distant relation to that sublime power by which the Creator projects, creates, and upholds his universe.

---

[2] The statement about decomposition of creation suggests Coleridge's definition of imagination (above, page 504).

[3] By Catherine Crowe (1848), clearly influenced by Coleridge's distinction between imagination and fancy. On Crowe see G. T. Clapton, "Baudelaire and Catherine Crowe," *Modern Language Review* XXV, 3 (1930), 286–305.

I am not at all ashamed but, on the contrary, very happy to be in agreement with the excellent Mrs. Crowe, in whom I have always admired the capacity for belief which is as fully developed in her as is the capacity for distrust in many others.

I was saying that long ago I had heard a man,[4] truly scholarly and profoundly learned in his art, express the most comprehensive and yet the most simple ideas on this subject. When I met him for the first time, I had no experience other than that which comes from an overwhelming love and no other reasoning save instinct. It is true that this love and this instinct were fairly keen, for from my earliest youth, my eyes, filled with paintings or engravings, could never be satiated, and I think that worlds could come to an end, *impavidum ferient,*[5] before I would become an iconoclast. Evidently he wanted to be very kind and obliging, for at first we talked of commonplaces, that is to say, of the most comprehensive and the most profound questions—about nature, for example. "Nature is only a dictionary," he would often say. To properly understand the full meaning implied in this statement, one should keep in mind the many ordinary uses of the dictionary. In it one seeks the meaning of words, the genealogy of words, the etymology of words; in short, one extracts from it all the elements that compose a sentence and a narrative. But no one has ever considered the dictionary as a composition in the poetic sense of the word. Painters who obey their imagination seek in their dictionary the elements which suit their conception; yet, in adapting these elements with a certain art, they give them an altogether new physiognomy. Those who lack imagination copy the dictionary. The result is a very great fault, the fault of banality, which is especially true of those painters whose speciality brings them into closer contact with exterior nature—landscape painters, for example, who generally consider it a triumph not to show their personality. Through too much looking, they forget to feel and to think. . . .

I have no fear that anyone will find it absurd to suppose that the same education is applicable to a host of different individuals. For it is evident that systems of rhetoric and prosody are not arbitrarily invented tyrannies, but rather a collection of rules required by the very nature of the spiritual being. And systems of prosody and rhetoric have never kept originality from showing itself clearly. The contrary—namely, that they have aided the development of originality—would be infinitely more true.

To be brief, I am obliged to omit numerous corollaries resulting from my principal formula, in which is contained, so to speak, the entire formulary of the true aesthetic, and which may be expressed thus: The whole visible universe is but a storehouse of images and signs[6] to which imagination will give a relative place and value; it is a sort of food which the imagination must digest and transform. All the powers of the human soul must be subordinated to the imagination, which commandeers them all at one and the same time. Just as knowing the dictionary well does not necessarily imply a knowledge of the art of composition, and just as the art of composition does not itself imply a universal imagination, so a good painter may not be a great painter. But a great painter is inevitably a good painter, because a universal imagination includes the understanding of all means of expression and the desire to master them.

Karl Marx

1818–1883

◇ ◇ ◇

Friedrich Engels

1820–1895

Karl Marx and Friedrich Engels, from very different backgrounds, met and began their lifelong collaboration in association with the "Young Hegelians" in Berlin, following Bruno Bauer and others. Marx, a university student, and Engels, a young military officer with notable talent as a journalist (and later, a businessman), were drawn first to the systematic presentation of Hegel's conception of dialectic by the Young Hegelians as a historical process of change, through conflict, that afforded a rational basis for opposition to authoritarian and repressive government. Engels became an adherent of communism, as espoused by Moses Hess, and followed radical causes even after he relocated to Manchester, England, in 1842 to take a position in his family's cotton business. In the same year, Marx became a regular contributor, and later editor, of the *Rheinische Zeitung* in Cologne, publishing numerous editorials on social and economic matters. After active work with radical causes in Paris, Marx moved to London, his residence until his death. From the late 1840s on, the collaborations of Marx and Engels transformed the world of radical politics, particularly after the publication of the *Communist Manifesto* in 1848. The theoretical and practical work of both men also led to a mode and method of political and economic analysis that fused moral, political, and economic analysis in an explicitly materialist framework that remains a critical resource for thinking and writing in virtually all disciplines of the humanities and social sciences. Not only did Marx and Engels have a doctrinal influence on critics and writers, they provided a basis for a broad movement that considered literature a sociological phenomenon, making literature analyzable as a symptom of social situations.

The position of Marx and Engels is that social being determines consciousness and not vice versa. Art, an expression of consciousness, is thus also determined by social being and is therefore usually characterized by struggle in which the class differences and conflicts within society are fought out. Their work comes in the wake of Romanticism's growing interest in the function of the poet in society (as for example in Shelley [above, page 537]). With the growth of positivistic, scientifically oriented philosophies and disciplines in anthropology, sociology, and psychology, interest increased in literature as historical or sociological document. In this context, Marxist writers have frequently placed very heavy emphasis upon Marxism as a form of "scientific" analysis, but it is particularly clear today that much of its vitality as a continuing tradition of analysis depends on its attention to ethical and practical issues of social justice, fusing moral, philosophical, and political questions in a continuing dialectical debate. In the United States and England, Marxist criticism flourished in the 1930s, with a corresponding vogue in Europe continuing through the sixties and later. In Europe, the tradition of dialectical analysis, following Marx and Engels, however, has had a much more central place in intellectual life, reflected now in a wide variety of orientations and positions in criticism, widely disseminated through the work of such thinkers as Sartre (below, page 1175), Althusser (below, page 1297), and Raymond Williams (below, page 1356), and visible in much work in feminist and gender theory, deconstruction, postcolonial studies, and the New Historicism.

For further reading, see Karl Marx and Frederick Engels, *Collected Works* in forty-nine volumes (1975). A valuable collection is *Literature and Art by Karl Marx and Friedrich Engels: Selections from Their Writings* (1947). Among the many studies of Marx and books exhibiting or commenting on a Marxist approach the following may be mentioned: Nikolai Bukharin, *Problems of Soviet Literature* (n. d.); Leon Trotsky, *Literature and Revolution* (1924); G. V. Plekhanov, *Art and Society* (1937); Christopher Caudwell, *Illusion and Reality* (1937) and *Studies in a Dying Culture* (1938); Ralph Fox, *The Novel and The People (1937);* Mikhail Lifshitz, *The Philosophy of Art of Karl Marx* (1938); Georg Lukács, *The Meaning of Contemporary Realism* (1958); Peter Demetz, *Marx, Engels, and die Dichter* (1959); Ernst Fischer, *The Necessity of Art: A Marxist Approach* (1963); Louis Althusser, *For Marx* (1969); Fredric Jameson, *Marxism and Form* (1971) and *The Political Unconscious: Narrative as a Socially Symbolic Act* (1981); Terry Eagleton, *Marxism and Literary Criticism* (1976) and *Literary Theory: An Introduction* (1983); Herbert Marcuse, *The Aesthetic Dimension: Toward a Critique of Marxist Aesthetics* (tr. 1978); Leonard Jackson, *The Dematerialization of Karl Marx: Literature and Marxist Theory* (1994).

Manifesto of the Communist Party

A spectre is haunting Europe—the spectre of Communism. All the powers of old Europe have entered into a holy alliance to exorcise this spectre: Pope and Czar, Metternich and Guizot, French Radicals and German police-spies.

Where is the party in opposition that has not been decried as communistic by its opponents in power? Where the Opposition that has not hurled back the branding reproach of Communism, against the more advanced opposition parties, as well as against its reactionary adversaries?

Two things result from this fact:

I. Communism is already acknowledged by all European powers to be itself a power.

II. It is high time that Communists should openly, in the face of the whole world, publish their views, their aims, their tendencies, and meet this nursery tale of the spectre of Communism with a manifesto of the party itself.

To this end, Communists of various nationalities have assembled in London, and sketched the following manifesto, to be published in the English, French, German, Italian, Flemish and Danish languages.

The *Manifesto of the Communisty Party* (commonly cited as "The Communist Manifesto") was first published in London in 1848. Reprinted here in the authorized English translation, copyright 1948 by International Publishers.

I

Bourgeois and Proletarians[1]

The history of all hitherto existing society[2] is the history of class struggles.

Freeman and slave, patrician and plebeian, lord and serf, guildmaster[3] and journeyman, in a word, oppressor and oppressed, stood in constant opposition to one another, carried on an uninterrupted, now hidden, now open fight, a fight that each time ended, either in a revolutionary reconstitution of society at large, or in the common ruin of the contending classes.

In the earlier epochs of history, we find almost everywhere a complicated arrangement of society into various orders, a manifold gradation of social rank. In ancient Rome we have patricians, knights, plebeians, slaves; in the Middle Ages, feudal lords, vassals, guild-masters, journeymen, apprentices, serfs; in almost all of these classes, again, subordinate gradations.

The modern bourgeois society that has sprouted from the ruins of feudal society, has not done away with class antagonisms. It has but established new classes, new conditions of oppression, new forms of struggle in place of the old ones.

Our epoch, the epoch of the bourgeoisie, possesses, however, this distinctive feature: It has simplified the class antagonisms. Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other—bourgeoisie and proletariat.

From the serfs of the Middle Ages sprang the chartered burghers[4] of the earliest towns. From these burgesses the first elements of the bourgeoisie were developed.

The discovery of America, the rounding of the Cape, opened up fresh ground for the rising bourgeoisie. The East-Indian and Chinese markets, the colonisation of America, trade with the colonies, the increase in the means of exchange and in commodities generally, gave to commerce, to navigation, to industry, an impulse never before known, and thereby, to the revolutionary element in the tottering feudal society, a rapid development.

The feudal system of industry, in which industrial production was monopolised by closed guilds,[5] now no longer sufficed for the growing wants of the new markets. The manufacturing system took its place. The guild-masters were pushed aside by the manufacturing middle class; division of labour between the different corporate guilds vanished in the face of division of labour in each single workshop.

Meantime the markets kept ever growing, the demand ever rising. Even manufacture no longer sufficed. Thereupon, steam and machinery revolutionised industrial production. The place of manufacture was taken by the giant, modern industry, the place of the industrial middle class, by industrial millionaires—the leaders of whole industrial armies, the modern bourgeois.

Modern industry has established the world market, for which the discovery of America paved the way. This market has given an immense development to commerce, to navigation, to communication by land. This development has, in its turn, reacted on the extension of industry; and in proportion as industry, commerce, navigation, railways extended, in the same proportion the bourgeoisie developed, increased its capital, and pushed into the background every class handed down from the Middle Ages.

We see, therefore, how the modern bourgeoisie is itself the product of a long course of development, of a series of revolutions in the modes of production and of exchange.

Each step in the development of the bourgeoisie was accompanied by a corresponding political advance of that class. An oppressed class under the sway of the feudal nobility, it became an armed and self-governing association in

---

(The notes below include the annotations of Engels and the International Publishers editor, from the 1948 edition of the Authorized English Translation. The source of the notes is indicated.)

[1] [Engels] By bourgeoisie is meant the class of modern capitalists, owners of the means of social production and employers of wage-labour; by proletariat, the class of modern wage-labourers who, having no means of production of their own, are reduced to selling their labour power in order to live.

[2] [Engels] That is, all *written* history. In 1837, the prehistory of society, the social organisation existing previous to recorded history, was all but unknown. Since then Haxthausen [August von, 1792–1866] discovered common ownership of land in Russia, Maurer [Georg Ludwig von] proved it to be the social foundation from which all Teutonic races started in history, and, by and by, village communities were found to be, or to have been, the primitive form of society everywhere from India to Ireland. The inner organisation of this primitive communistic society was laid bare, in its typical form, by Morgan's [Lewis H., 1818–1881] crowning discovery of the true nature of the *gens* and its relation to the *tribe*. With the dissolution of these primaeval communities, society begins to be differentiated into separate and finally antagonistic classes. I have attempted to retrace this process of dissolution in *The Origin of the Family, Private Property and the State*.

[3] [Engels] Guild-master, that is a full member of a guild, a master within, not a head of a guild. [(Eds.) See Hegel, above, page 552.]

[4] [International Publishers Ed.] Chartered burghers were freemen who had been admitted to the privileges of a chartered borough thus possessing full political rights.

[5] [International Publishers Ed.] Craft guilds, made up of exclusive and privileged groups of artisans were, during the feudal period, granted monopoly rights to markets by municipal authorities. The guilds imposed minute regulations on their members controlling such matters as working hours, wages, prices, tools and the hiring of workers.

the medieval commune;[6] here independent urban republic (as in Italy and Germany), there taxable "third estate" of the monarchy (as in France); afterwards, in the period of manufacture proper, serving either the semi-feudal or the absolute monarchy as a counterpoise against the nobility, and, in fact, corner-stone of the great monarchies in general—the bourgeoisie has at last, since the establishment of modern industry and of the world market, conquered for itself, in the modern representative state, exclusive political sway. The executive of the modern state is but a committee for managing the common affairs of the whole bourgeoisie.

The bourgeoisie has played a most revolutionary rôle in history.

The bourgeoisie, wherever it has got the upper hand, has put an end to all feudal, patriarchal, idyllic relations. It has pitilessly torn asunder the motley feudal ties that bound man to his "natural superiors," and has left no other bond between man and man than naked self-interest, than callous "cash payment." It has drowned the most heavenly ecstasies of religious fervour, of chivalrous enthusiasm, of philistine sentimentalism, in the icy water of egotistical calculation. It has resolved personal worth into exchange value, and in place of the numberless indefeasible chartered freedoms, has set up that single, unconscionable freedom—Free Trade. In one word, for exploitation, veiled by religious and political illusions, it has substituted naked, shameless, direct, brutal exploitation.

The bourgeoisie has stripped of its halo every occupation hitherto honoured and looked up to with reverent awe. It has converted the physician, the lawyer, the priest, the poet, the man of science, into its paid wage-labourers.

The bourgeoisie has torn away from the family its sentimental veil, and has reduced the family relation to a mere money relation.

The bourgeoisie has disclosed how it came to pass that the brutal display of vigour in the Middle Ages, which reactionaries so much admire, found its fitting complement in the most slothful indolence. It has been the first to show what man's activity can bring about. It has accomplished wonders far surpassing Egyptian pyramids, Roman aqueducts, and Gothic cathedrals; it has conducted expeditions that put in the shade all former migrations of nations and crusades.

The bourgeoisie cannot exist without constantly revolutionising the instruments of production, and thereby the relations of production, and with them the whole relations of society. Conservation of the old modes of production in unaltered form, was, on the contrary, the first condition of existence for all earlier industrial classes. Constant revolutionising of production, uninterrupted disturbance of all social conditions, everlasting uncertainty and agitation distinguish the bourgeois epoch from all earlier ones. All fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new-formed ones become antiquated before they can ossify. All that is solid melts into air, all that is holy is profaned, and man is at last compelled to face with sober senses his real conditions of life and his relations with his kind.

The need of a constantly expanding market for its products chases the bourgeoisie over the whole surface of the globe. It must nestle everywhere, settle everywhere, establish connections everywhere.

The bourgeoisie has through its exploitation of the world market given a cosmopolitan character to production and consumption in every country. To the great chagrin of reactionaries, it has drawn from under the feet of industry the national ground on which it stood. All old-established national industries have been destroyed or are daily being destroyed. They are dislodged by new industries, whose introduction becomes a life and death question for all civilised nations, by industries that no longer work up indigenous raw material, but raw material drawn from the remotest zones; industries whose products are consumed, not only at home, but in every quarter of the globe. In place of the old wants, satisfied by the production of the country, we find new wants, requiring for their satisfaction the products of distant lands and climes. In place of the old local and national seclusion and self-sufficiency, we have intercourse in every direction, universal inter-dependence of nations. And as in material, so also in intellectual production. The intellectual creations of individual nations become common property. National one-sidedness and narrow-mindedness become more and more impossible, and from the numerous national and local literatures there arises a world literature.

The bourgeoisie, by the rapid improvement of all instruments of production, by the immensely facilitated means of communication, draws all nations, even the most barbarian, into civilization. The cheap prices of its commodities are the heavy artillery with which it batters down all Chinese walls, with which it forces the barbarians' intensely obstinate hatred of foreigners to capitulate. It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them to introduce what it calls civilisation into their midst, *i.e.*, to become bourgeois themselves. In a word, it creates a world after its own image.

---

[6] [Engels] "Commune" was the name taken in France by the nascent towns even before they had conquered from their feudal lords and masters local self-government and political rights as the "Third Estate." Generally speaking, for the economic development of the bourgeoisie, England is here taken as the typical country, for its political development, France.

The bourgeoisie has subjected the country to the rule of the towns. It has created enormous cities, has greatly increased the urban population as compared with the rural, and has thus rescued a considerable part of the population from the idiocy of rural life. Just as it has made the country dependent on the towns, so it has made barbarian and semi-barbarian countries dependent on the civilised ones, nations of peasants on nations of bourgeois, the East on the West.

More and more the bourgeoisie keeps doing away with the scattered state of the population, of the means of production, and of property. It has agglomerated population, centralised means of production, and has concentrated property in a few hands. The necessary consequence of this was political centralisation. Independent, or but loosely connected provinces, with separate interests, laws, governments and systems of taxation, became lumped together into one nation, with one government, one code of laws, one national class interest, one frontier and one customs tariff.

The bourgeoisie, during its rule of scarce one hundred years, has created more massive and more colossal productive forces than have all preceding generations together. Subjection of nature's forces to man, machinery, application of chemistry to industry and agriculture, steam-navigation, railways, electric telegraphs, clearing of whole continents for cultivation, canalisation of rivers, whole populations conjured out of the ground—what earlier century had even a presentiment that such productive forces slumbered in the lap of social labour?

We see then that the means of production and of exchange, which served as the foundation for the growth of the bourgeoisie, were generated in feudal society. At a certain stage in the development of these means of production and of exchange, the conditions under which feudal society produced and exchanged, the feudal organisation of agriculture and manufacturing industry, in a word, the feudal relations of property became no longer compatible with the already developed productive forces; they became so many fetters. They had to be burst asunder; they were burst asunder.

Into their place stepped free competition, accompanied by a social and political constitution adapted to it, and by the economic and political sway of the bourgeois class.

A similar movement is going on before our own eyes. Modern bourgeois society with its relations of production, of exchange and of property, a society that has conjured up such gigantic means of production and of exchange, is like the sorcerer who is no longer able to control the powers of the nether world whom he has called up by his spells. For many a decade past the history of industry and commerce is but the history of the revolt of modern productive forces against modern conditions of production, against the property relations that are the conditions for the existence of the bourgeoisie and of its rule. It is enough to mention the commercial crises that by their periodical return put the existence of the entire bourgeois society on trial, each time more threateningly. In these crises a great part not only of the existing products, but also of the previously created productive forces, are periodically destroyed. In these crises there breaks out an epidemic that, in all earlier epochs, would have seemed an absurdity—the epidemic of over-production. Society suddenly finds itself put back into a state of momentary barbarism; it appears as if a famine, a universal war of devastation had cut off the supply of every means of subsistence; industry and commerce seem to be destroyed. And why? Because there is too much civilisation, too much means of subsistence, too much industry, too much commerce. The productive forces at the disposal of society no longer tend to further the development of the conditions of bourgeois property; on the contrary, they have become too powerful for these conditions, by which they are fettered, and no sooner do they overcome these fetters than they bring disorder into the whole of bourgeois society, endanger the existence of bourgeois property. The conditions of bourgeois society are too narrow to comprise the wealth created by them. And how does the bourgeoisie get over these crises? On the one hand by enforced destruction of a mass of productive forces; on the other, by the conquest of new markets, and by the more thorough exploitation of the old ones. That is to say, by paving the way for more extensive and more destructive crises, and by diminishing the means whereby crises are prevented.

The weapons with which the bourgeoisie felled feudalism to the ground are now turned against the bourgeoisie itself.

But not only has the bourgeoisie forged the weapons that bring death to itself; it has also called into existence the men who are to wield those weapons—the modern working class—the proletarians.

In proportion as the bourgeoisie, *i.e.*, capital, is developed, in the same proportion is the proletariat, the modern working class, developed—a class of labourers, who live only so long as they find work, and who find work only so long as their labour increases capital. These labourers, who must sell themselves piecemeal, are a commodity, like every other article of commerce, and are consequently exposed to all the vicissitudes of competition, to all the fluctuations of the market.

Owing to the extensive use of machinery and to division of labour, the work of the proletarians has lost all individual character, and, consequently, all charm for the workman. He becomes an appendage of the machine, and it is only the most simple, most monotonous, and most easily acquired knack, that is required of him. Hence, the cost of production of a workman is restricted, almost entirely, to the means of subsistence that he requires for his maintenance, and for the propagation of his race. But the price of a commodity, and therefore also of labour, is equal to its cost of production. In proportion, therefore, as the repulsiveness of the work increases, the wage decreases. Nay more, in proportion as the use of machinery and division of labour increases, in the same proportion the burden of toil also increases, whether by prolongation of the working hours, by increase of the work exacted in a given time, or by increased speed of the machinery, etc.

Modern industry has converted the little workshop of the patriarchal master into the great factory of the industrial capitalist. Masses of labourers, crowded into the factory, are organised like soldiers. As privates of the industrial army they are placed under the command of a perfect hierarchy of officers and sergeants. Not only are they slaves of the bourgeois class, and of the bourgeois state; they are daily and hourly enslaved by the machine, by the over-looker, and, above all, by the individual bourgeois manufacturer himself. The more openly this despotism proclaims gain to be its end and aim, the more petty, the more hateful and the more embittering it is.

The less the skill and exertion of strength implied in manual labour, in other words, the more modern industry develops, the more is the labour of men superseded by that of women. Differences of age and sex have no longer any distinctive social validity for the working class. All are instruments of labour, more or less expensive to use, according to their age and sex.

No sooner has the labourer received his wages in cash, for the moment escaping exploitation by the manufacturer, than he is set upon by the other portions of the bourgeoisie, the landlord, the shopkeeper, the pawnbroker, etc.

The lower strata of the middle class—the small tradespeople, shopkeepers, and retired tradesmen generally, the handicraftsmen and peasants—all these sink gradually into the proletariat, partly because their diminutive capital does not suffice for the scale on which modern industry is carried on, and is swamped in the competition with the large capitalists, partly because their specialised skill is rendered worthless by new methods of production. Thus the proletariat is recruited from all classes of the population.

The proletariat goes through various stages of development. With its birth begins its struggle with the bourgeoisie. At first the contest is carried on by individual labourers, then by the work people of a factory, then by the operatives of one trade, in one locality, against the individual bourgeois who directly exploits them. They direct their attacks not against the bourgeois conditions of production, but against the instruments of production themselves; they destroy imported wares that compete with their labour, they smash machinery to pieces, they set factories ablaze, they seek to restore by force the vanished status of the workman of the Middle Ages.

At this stage the labourers still form an incoherent mass scattered over the whole country, and broken up by their mutual competition. If anywhere they unite to form more compact bodies, this is not yet the consequence of their own active union, but of the union of the bourgeoisie, which class, in order to attain its own political ends, is compelled to set the whole proletariat in motion, and is moreover still able to do so for a time. At this stage, therefore, the proletarians do not fight their enemies, but the enemies of their enemies, the remnants of absolute monarchy, the landowners, the non-industrial bourgeois, the petty bourgeoisie. Thus the whole historical movement is concentrated in the hands of the bourgeoisie; every victory so obtained is a victory for the bourgeoisie.

But with the development of industry the proletariat not only increases in number; it becomes concentrated in greater masses, its strength grows, and it feels that strength more. The various interests and conditions of life within the ranks of the proletariat are more and more equalised, in proportion as machinery obliterates all distinctions of labour and nearly everywhere reduces wages to the same low level. The growing competition among the bourgeois, and the resulting commercial crises, make the wages of the workers ever more fluctuating. The unceasing improvement of machinery, ever more rapidly developing, makes their livelihood more and more precarious; the collisions between individual workmen and individual bourgeois take more and more the character of collisions between two classes. Thereupon the workers begin to form combinations (trade unions) against the bourgeoisie; they club together in order to keep up the rate of wages; they found permanent associations in order to make provision beforehand for these occasional revolts. Here and there the contest breaks out into riots.

Now and then the workers are victorious, but only for a time. The real fruit of their battles lies, not in the immediate result, but in the ever expanding union of the workers. This union is furthered by the improved means of communication which are created by modern industry, and which place the workers of different localities in contact with one another. It was just this contact that was needed to centralise the numerous local struggles, all of the same character, into one national struggle between classes. But every class struggle is a political struggle. And that union, to attain which the burghers of the Middle Ages, with their miserable highways, required centuries, the modern proletarians, thanks to railways, achieve in a few years.

This organisation of the proletarians into a class, and consequently into a political party, is continually being upset again by the competition between the workers themselves. But it ever rises up again, stronger, firmer, mightier. It compels legislative recognition of particular interests of the workers, by taking advantage of the divisions among the bourgeoisie itself. Thus the ten-hour bill[7] in England was carried.

Altogether, collisions between the classes of the old society further the course of development of the proletariat in many ways. The bourgeoisie finds itself involved in a constant battle. At first with the aristocracy; later on, with those portions of the bourgeoisie itself whose interests have become antagonistic to the progress of industry; at all times with the bourgeoisie of foreign countries. In all these battles it sees itself compelled to appeal to the proletariat, to ask for its help, and thus, to drag it into the political arena. The bourgoisie itself, therefore, supplies the proletariat with its own elements of political and general education, in other words, it furnishes the proletariat with weapons for fighting the bourgeoisie.

Further, as we have already seen, entire sections of the ruling classes are, by the advance of industry; precipitated into the proletariat, or are at least threatened in their conditions of existence. These also supply the proletariat with fresh elements of enlightenment and progress.

Finally, in times when the class struggle nears the decisive hour, the process of dissolution going on within the ruling class, in fact within the whole range of old society, assumes such a violent, glaring character, that a small section of the ruling class cuts itself adrift; and joins the revolutionary class, the class that holds the future in its hands. Just as, therefore, at an earlier period, a section of the nobility went over to the bourgeoisie, so now a portion of the bourgeoisie goes over to the proletariat, and in particular, a portion of the bourgeois ideologists, who have raised themselves to the level of comprehending theoretically the historical movement as a whole.

Of all the classes that stand face to face with the bourgeoisie today, the proletariat alone is a really revolutionary class. The other classes decay and finally disappear in the face of modern industry; the proletariat is its special and essential product.

The lower middle class, the small manufacturer, the shopkeeper, the artisan, the peasant, all these fight against the bourgeoisie, to save from extinction their existence as fractions of the middle class. They are therefore not revolutionary, but conservative. Nay more, they are reactionary, for they try to roll back the wheel of history. If by chance they are revolutionary, they are so only in view of their impending transfer into the proletariat; they thus defend not their present, but their future interests; they desert their own standpoint to adopt that of the proletariat.

The "dangerous class," the social scum *(Lumpenproletariat),* that passively rotting mass thrown off by the lowest layers of old society, may, here and there, be swept into the movement by a proletarian revolution; its conditions of life, however, prepare it far more for the part of a bribed tool of reactionary intrigue.

The social conditions of the old society no longer exist for the proletariat. The proletarian is without property; his relation to his wife and children has no longer anything in common with bourgeois family relations; modern industrial labour, modern subjection to capital, the same in England as in France, in America as in Germany, has stripped him of every trace of national character. Law, morality, religion, are to him so many bourgeois prejudices, behind which lurk in ambush just as many bourgeois interests.

All the preceding classes that got the upper hand, sought to fortify their already acquired status by subjecting society at large to their conditions of appropriation. The proletarians cannot become masters of the productive forces of society, except by abolishing their own previous mode of appropriation, and thereby also every other previous mode of appropriation: They have nothing of their own to secure and to fortify; their mission is to destroy all previous securities for, and insurances of, individual property.

All previous historical movements were movements of minorities, or in the interest of minorities. The proletarian movement is the self-conscious, independent movement of the immense majority, in the interest of the immense majority. The proletariat, the lowest stratum of our present society, cannot stir, cannot raise itself up, without the whole superincumbent strata of official society being sprung into the air.

Though not in substance, yet in form, the struggle of the proletariat with the bourgeoisie is at first a national struggle. The proletariat of each country must, of course, first of all settle matters with its own bourgeoisie.

In depicting the most general phases of the development of the proletariat, we traced the more or less veiled civil war, raging within existing society, up to the point where that war breaks out into open revolution, and where the violent overthrow of the bourgeoisie lays the foundation for the sway of the proletariat.

---

[7] [International Publishers Ed.] The ten-hour bill, for which the English workers had been fighting for 30 years, was made a law in 1847.

Hitherto, every form of society has been based, as we have already seen, on the antagonism of oppressing and oppressed classes. But in order to oppress a class, certain conditions must be assured to it under which it can, at least, continue its slavish existence. The serf, in the period of serfdom, raised himself to membership in the commune, just as the petty bourgeois, under the yoke of feudal absolutism, managed to develop into a bourgeois. The modern labourer, on the contrary, instead of rising with the progress of industry, sinks deeper and deeper below the conditions of existence of his own class. He becomes a pauper, and pauperism develops more rapidly than population and wealth. And here it becomes evident, that the bourgeoisie is unfit any longer to be the ruling class in society, and to impose its conditions of existence upon society as an over-riding law. It is unfit to rule because it is incompetent to assure an existence to its slave within his slavery, because it cannot help letting him sink into such a state, that it has to feed him, instead of being fed by him. Society can no longer live under this bourgeoisie, in other words, its existence is no longer compatible with society.

The essential condition for the existence and sway of the bourgeois class, is the formation and augmentation of capital; the condition for capital is wage-labour. Wage-labour rests exclusively on competition between the labourers. The advance of industry, whose involuntary promoter is the bourgeoisie, replaces the isolation of the labourers, due to competition, by their revolutionary combination, due to association. The development of modern industry, therefore, cuts from under its feet the very foundation on which the bourgeoisie produces and appropriates products. What the bourgeoisie therefore produces, above all, are its own grave-diggers. Its fall and the victory of the proletariat are equally inevitable.

The German Ideology

The production of ideas, of conceptions, of consciousness, is at first directly interwoven with the material activity and the material intercourse of men, the language of real life. Conceiving, thinking, the mental intercourse of men, appear at this stage as the direct efflux of their material behavior. The same applies to mental production as expressed in the language of the politics, laws, morality, religion, metaphysics of a people. Men are the producers of their conceptions, ideas, etc.—real, active men, as they are conditioned by a definite development of their productive forces and of the intercourse corresponding to these, up to its furthest forms. Consciousness can never be anything else than conscious existence, and the existence of men is their actual life process. If in all ideology men and their circumstances appear upside down as in a camera obscura, this phenomenon arises just as much from their historical life process as the inversion of objects on the retina does from their physical life process.

In direct contrast to German philosophy which descends from heaven to earth, here we ascend from earth to heaven. That is to say, we do not set out from what men say, imagine, conceive, nor from men as narrated, thought of, imagined, conceived, in order to arrive at men in the flesh. We set out from real, active men, and on the basis of their real life process we demonstrate the development of the ideological reflexes and echoes of this life process. The phantoms formed in the human brain are also, necessarily, sublimates of their material life process, which is empirically verifiable and bound to material premises. Morality, religion, metaphysics, all the rest of ideology and their corresponding forms of consciousness, thus no longer retain the semblance of independence. They have no history, no development; but men, developing their material production and their material intercourse, alter, along with this their real existence, their thinking and the products of their thinking. Life is not determined by consciousness, but consciousness by life. In the first method of approach the starting point is consciousness taken as the living individual; in the second it is the real living individuals themselves, as they are in actual life, and consciousness is considered solely as *their* consciousness.

This method of approach is not devoid of premises. It starts out from the real premises and does not abandon them for a moment. Its premises are men, not in any fantastic isolation or abstract definition, but in their actual, empirically perceptible process of development under definite conditions. As soon as this active life process is described, history ceases to be a collection of dead facts as it is with the empiricists (themselves still abstract), or an imagined activity of imagined subjects, as with the idealists.

Where speculation ends—in real life—there real, positive science begins: the representation of the practical activity, of the practical process of development of men. Empty talk about consciousness ceases, and real knowledge has to

---

Die Deutsche Ideologie by Karl Marx and Friedrich Engels was written in 1846 but not published until 1932. Marx's *Zur Kritik der politischen Ökonomie* was published in 1849. Both translated excerpts are from *Literature and Art, by Karl Marx and Friedrich Engels: Selections from Their Writings* (New York: International Publishers, Inc., 1947).

take its place. When reality is depicted, philosophy as an independent branch of activity loses its medium of existence. At the best its place can only be taken by a summing-up of the most general results, abstractions which arise from the observation of the historical development of men. Viewed apart from real history, these abstractions have in themselves no value whatsoever. They can only serve to facilitate the arrangement of historical material, to indicate the sequence of its separate strata. But they by no means afford a recipe or schema, as does philosophy, for neatly trimming the epochs of history. On the contrary, our difficulties begin only when we set about the observation and the arrangement—the real depiction—of our historical material, whether of a past epoch or of the present. The removal of these difficulties is governed by premises which it is quite impossible to state here, but which only the study of the actual life process and the activity of the individuals of each epoch will make evident.

A Contribution to the Critique of Political Economy

It is well known that certain periods of highest development of art stand in no direct connection with the general development of society, nor with the material basis and the skeleton structure of its organization. Witness the example of the Greeks as compared with the modern nations or even Shakespeare. As regards certain forms of art, as, e.g., the epos, it is admitted that they can never be produced in the world-epoch-making form as soon as art as such comes into existence; in other words, that in the domain of art certain important forms of it are possible only at a low stage of its development. If that be true of the mutual relations of different forms of art within the domain of art itself, it is far less surprising that the same is true of the relation of art as a whole to the general development of society. The difficulty lies only in the general formulation of these contradictions. No sooner are they specified than they are explained. Let us take for instance the relation of Greek art and of that of Shakespeare's time to our own. It is a well-known fact that Greek mythology was not only the arsenal of Greek art, but also the very ground from which it had sprung. Is the view of nature and of social relations which shaped Greek imagination and Greek [art] possible in the age of automatic machinery, and railways, and locomotives, and electric telegraphs? Where does Vulcan come in as against Roberts & Co.; Jupiter, as against the lightning rod; and Hermes, as against the Credit Mobilier? All mythology masters and dominates and shapes the forces of nature in and through the imagination; hence it disappears as soon as man gains mastery over the forces of nature. What becomes of the goddess Fame side by side with Printing House Square? Greek art presupposes the existence of Greek mythology, i.e., that nature and even the form of society are wrought up in popular fancy in an unconsciously artistic fashion. That is its material. Not, however, any mythology taken at random, nor any accidental, unconsciously artistic elaboration of nature (including under the latter all objects; hence also society). Egyptian mythology could never be the soil or womb which would give birth to Greek art. But in any event there had to be a mythology. In no event could Greek art originate in a society which excludes any mythological explanation of nature, any mythological attitude towards it and which requires from the artist an imagination free from mythology.

Looking at it from another side: Is Achilles possible side by side with powder and lead? Or is the *Iliad* at all compatible with the printing press and steam press? Do not singing and reciting and the Muses necessarily go out of existence with the appearance of the printer's bar, and do not, therefore, disappear, the prerequisites of epic poetry?

But the difficulty is not in grasping the idea that Greek art and epos are bound up with certain forms of social development. It rather lies in understanding why they still constitute with us a source of aesthetic enjoyment and in certain respects prevail as the standard and model beyond attainment.

A man cannot become a child again unless he becomes childish. But does he not enjoy the artless ways of the child and must he not strive to reproduce its truth on a higher plane? Is not the character of every epoch revived perfectly true to nature in child nature? Why should the social childhood of mankind, where it had obtained its most beautiful development, not exert an eternal charm as an age that will never return? There are ill-bred children and precocious children. Many of the ancient nations belong to the latter class. The Greeks were normal children. The charm their art has for us does not conflict with the primitive character of the social order from which it had sprung. It is rather the product of the latter, and is rather due to the fact that the unripe social conditions under which the art arose and under which alone it could appear could never return.

* * *

In the social production which men carry on they enter into definite relations that are indispensable and independent of their will; these relations of production correspond to a definite stage of development of their material forces of production. The sum total of these relations of production constitutes the economic structure of society—the real foundation, on which rises a legal and political superstructure and to which correspond definite forms of social consciousness. The mode of production in material life determines the social, political, and intellectual life processes in general. It is not the consciousness of men that determines their being, but, on the contrary, their social being that determines their consciousness. At a certain stage of their development, the material forces of production in society come in conflict with the existing relations of production, or—what is but a legal expression for the same thing—with the property relations within which they have been at work before. From forms of development of the forces of production these relations turn into their fetters. Then begins an epoch of social revolution. With the change of the economic foundation the entire immense superstructure is more or less rapidly transformed. In considering such transformations a distinction should always be made between the material transformation of the economic conditions of production which can be determined with the precision of natural science, and the legal, political, religious, aesthetic, or philosophic—in short, ideological—forms in which men become conscious of this conflict and fight it out. Just as our opinion of an individual is not based on what he thinks of himself, so can we not judge of such a period of transformation by its own consciousness; on the contrary this consciousness must be explained rather from the contradictions of material life, from the existing conflict between the social forces of production and the relations of production. No social order ever disappears before all the productive forces for which there is room in it have been developed; and new higher relations of production never appear before the material conditions of their existence have matured in the womb of the old society itself. Therefore, mankind always sets itself only such tasks as it can solve; since, looking at the matter more closely, we will always find that the task itself arises only when the material conditions necessary for its solution already exist or are at least in the process of formation. In broad outlines we can designate the Asiatic, the ancient, the feudal, and the modern bourgeois modes of production as so many epochs in the progress of the economic formation of society. The bourgeois relations of production are the last antagonistic form of the social process of production—antagonistic not in the sense of individual antagonism, but of one arising from the social conditions of life of the individuals; at the same time the productive forces developing in the womb of bourgeois society create the material conditions for the solution of that antagonism. This social formation constitutes, therefore, the closing chapter of the prehistoric stage of human society.

Walter Pater

1839–1894

Often considered the father of aestheticism, Pater set forth the principles of impressionistic criticism in his *Studies in the History of the Renaissance.* A study of his Romantic forebears shows that his more extreme ideas clearly came out of their critical and epistemological positions. So powerful was the influence of his ideas that for a time Pater suppressed the famous Conclusion to his book, which he felt had been misinterpreted as an invitation to irresponsible hedonism. Pater himself advocated a fastidious decorum.

Pater mistrusts abstractions and finds definitions of beauty no basis for aesthetic theories. All aesthetic judgments must finally be referred to the reader's receptivity, his taste. The critic's worth depends on the refinement of his temperament, since objective standards of aesthetic judgment are abstract and useless. For Pater, criticism itself becomes a work of art, and he is justly known for his own impressionistic style of criticism, best and most extremely exemplified by his description of Leonardo da Vinci's *Mona Lisa,* which reads in part as follows: "She is older than the rocks among which she sits; like the vampire, she has been dead many times, and learned the secrets of the grave; and has been a diver in deep seas, and keeps their fallen day about her; and trafficked for strange webs with Eastern merchants, and, as Leda, was the mother of Helen of Troy, and as Saint Anne, the mother of Mary; and all this has been to her but as the sound of lyres and flutes, and lives only in the delicacy with which it has moulded the changing lineaments, and tinged the eyelids and the hands."

Earlier Romantic reservations about abstract thought and general nature, along with Romantic praise of immediate, personal, particular experience and of the sense of time lived rather than time measured, culminate in Pater's solipsistic remarks in the Conclusion of his book: "Experience, already reduced to a swarm ["a group" in 1888] of impressions is ringed round for each of us by that thick wall of personality through which no real voice has ever pierced on its way to us, or from us to that which we can only conjecture to be without." The Romantic hope for empathetic identity with natural objects and other beings is dismissed here, and there remains the gesture of personal style that can easily be thought of as a mask. Pater's view, though more morose, is akin to that of Anatole France, quoted in the headnote to Matthew Arnold (above, page 587).

Heir to the subject–object problem passed on to him by philosophers, Pater carries response to the problem to its extreme. Rejecting the materialists, he also rejects total dependence on rational understanding to give us what knowledge we can have. Expressive of his time, he emphasizes the fleeting temporality of all experience.

The standard text of Pater's work is the ten-volume edition published in 1910. Commentary includes Thomas Wright, *The Life of Walter Pater* (in two volumes, 1907); A. J. Farmer, *Walter Pater as a Critic of English Literature* (1931); T. S. Eliot, "Arnold and Pater," in his *Selected Essays 1917–1932* (1932); Arthur Symons, *A Study of Walter Pater* (1932); R. C. Child, *The Aesthetic of Walter Pater* (1940); Anthony Ward, *Walter*

Pater: The Idea in Nature (1967); Richmond Crinkley, *Walter Pater: Humanist* (1970); William E. Buckler, *Walter Pater: The Critic as Artist of Ideas* (1987); Paul Barolsky, *Walter Pater's Renaissance* (1987); Wolfgang Iser, *Walter Pater: The Aesthetic Moment* (tr. 1987); Denis Donoghue, *Walter Pater, Lover of Strange Souls* (1995); Walter Shuter, *Rereading Walter Pater* (1997).

Studies in the History of the Renaissance

from

Preface

Many attempts have been made by writers on art and poetry to define beauty in the abstract, to express it in the most general terms, to find a universal formula for it. The value of such attempts has most often been in the suggestive and penetrating things said by the way. Such discussions help us very little to enjoy what has been well done in art or poetry, to discriminate between what is more and what is less excellent in them, or to use words like *beauty, excellence, art, poetry,* with more meaning than they would otherwise have. Beauty, like all other qualities presented to human experience, is relative; and the definition of it becomes unmeaning and useless in proportion to its abstractness. To define beauty not in the most abstract, but in the most concrete terms possible, not to find a universal formula for it, but the formula which expresses most adequately this or that special manifestation of it, is the aim of the true student of aesthetics.

"To see the object as in itself it really is,"[1] has been justly said to be the aim of all true criticism whatever; and in aesthetic criticism the first step towards seeing one's object as it really is, is to know one's own impression as it really is, to discriminate it, to realize it distinctly. The objects with which aesthetic criticism deals, music, poetry, artistic and accomplished forms of human life, are indeed receptacles of so many powers or forces; they possess, like natural elements, so many virtues or qualities. What is this song or picture, this engaging personality presented in life or in a book, to me? What effect does it really produce on me? Does it give me pleasure? and if so, what sort or degree of pleasure? How is my nature modified by its presence and under its influence? The answers to these questions are the original facts with which the aesthetic critic has to do; and, as in the study of light, of morals, of number, one must realize such primary data for oneself or not at all. And he who experiences these impressions strongly, and drives directly at the analysis and discrimination of them, need not trouble himself with the abstract question what beauty is in itself, or its exact relation to truth or experience—metaphysical questions, as unprofitable as metaphysical questions elsewhere. He may pass them all by as being, answerable or not, of no interest to him.

The aesthetic critic, then, regards all the objects with which he has to do, all works of art and the fairer forms of nature and human life, as powers or forces, producing pleasurable sensations, each of a more or less peculiar and unique kind. This influence he feels and wishes to explain, analyzing it, and reducing it to its elements. To him, the picture, the landscape, the engaging personality in life or in a book, *La Gioconda,*[2] the hills of Carrara, Pico of Mirandola,[3] are valuable for their virtues, as we say in speaking of a herb, a wine, a gem; for the property each has of affecting one with a special, unique impression of pleasure. Education grows in proportion as one's susceptibility to these impressions increases in depth and variety. And the function of the aesthetic critic is to distinguish, analyze, and separate from its adjuncts, the virtue by which a picture, a landscape, a fair personality in life or in a book, produces this special impression of beauty or pleasure, to indicate what the source of that impression is, and under what conditions it is experienced. His end is reached when he has disengaged that virtue, and noted it, as a chemist notes some natural element, for himself and others; and the rule for those who would reach this end is stated with great exactness in the words of a recent critic of Sainte-Beuve: *"De se borner à connaître de près les belles choses, et à s'en nourrir en exquis amateurs, en humanistes accomplis."*[4]

Pater's *Studies in the History of the Renaissance,* in a later edition called simply *The Renaissance,* was first published in 1873. Pater omitted the Conclusion, after an outcry against it, in the second edition of 1877, but restored it with a few slight changes in 1888. The text is from the 1873 edition.

[1] See Arnold, *The Function of Criticism* (above, page 594).

[2] The Mona Lisa by Leonardo da Vinci (1452–1519).

[3] Giovanni, Count Pico della Mirandola (1463–1494), Italian humanist, to whom Pater devoted Chapter II.

[4] Charles Augustin Sainte-Beuve (1804–1869), French critic. [Pater] "To limit themselves to know lovely things near at hand, and to nourish themselves upon them, like refined conoisseurs, like accomplished humanists."

What is important, then, is not that the critic should possess a correct abstract definition of beauty for the intellect, but a certain kind of temperament, the power of being deeply moved by the presence of beautiful objects. He will remember always that beauty exists in many forms. To him all periods, types, schools of taste, are in themselves equal. In all ages there have been some excellent workmen and some excellent work done. The question he asks is always, In whom did the stir, the genius, the sentiment of the period find itself? Who was the receptacle of its refinement, its elevation, its taste? "The ages are all equal," says William Blake, "but genius is always above its age."[5]

Often it will require great nicety to disengage this virtue from the commoner elements with which it may be found in combination. Few artists, not Goethe or Byron[6] even, work quite cleanly, casting off all debris, and leaving us only what the heat of their imagination has wholly fused and transformed. Take for instance the writings of Wordsworth.[7] The heat of his genius, entering into the substance of his work, has crystalized a part, but only a part, of it; and in that great mass of verse there is much which might well be forgotten. But scattered up and down it, sometimes fusing and transforming entire compositions, like the stanzas on *Resolution and Independence* and the ode on the *Recollections of Childhood,* sometimes, as if at random, turning a fine crystal here and there, in a matter it does not wholly search through and transform, we trace the action of his unique incommunicable faculty, that strange mystical sense of a life in natural things, and of man's life as a part of nature, drawing strength and color and character from local influences, from the hills and streams and natural sights and sounds. Well! That is the *virtue,* the active principle in Wordsworth's poetry; and then the function of the critic of Wordsworth is to trace that active principle, to disengage it, to mark the degree in which it penetrates his verse.

Conclusion

Λέγει πον ʽΗράχλειτος ὅτι πάντα χωρεῖ καὶ οὐδὲν μένει.[8]

PLATO

To regard all things and principles of things as inconstant modes or fashions has more and more become the tendency of modern thought. Let us begin with that which is without—our physical life. Fix upon it in one of its more exquisite intervals, the moment, for instance, of delicious recoil from the flood of water in summer heat. What is the whole physical life in that moment but a combination of natural elements to which science gives their names? But these elements, phosphorus and lime and delicate fibers, are present not in the human body alone: we detect them in places most remote from it. Our physical life is a perpetual motion of them—the passage of the blood, the wasting and repairing of the lenses of the eye, the modification of the tissues of the brain by every ray of light and sound—processes which science reduces to simpler and more elementary forces. Like the elements of which we are composed, the action of these forces extends beyond us; it rusts iron and ripens corn. Far out on every side of us these elements are broadcast, driven by many forces; and birth and gesture and death and the springing of violets from the grave are but a few out of ten thousand resulting combinations. That clear perpetual outline of face and limb is but an image of ours under which we group them—a design in a web, the actual threads of which pass out beyond it. This at least of flamelike our life has, that it is but the concurrence, renewed from moment to moment, of forces parting sooner or later on their ways.

Or if we begin with the inward world of thought and feeling, the whirlpool is still more rapid, the flame more eager and devouring. There it is no longer the gradual darkening of the eye and fading of color from the wall—the movement of the shore side, where the water flows down indeed, though in apparent rest—but the race of the midstream, a drift of momentary acts of sight and passion and thought. At first sight experience seems to bury us under a flood of external objects, pressing upon us with a sharp importunate reality, calling us out of ourselves in a thousand forms of action. But when reflection begins to act upon those objects they are dissipated under its influence; the cohesive force is suspended like a trick of magic; each object is loosed into a group of impressions—color, odor, texture—in the mind of the observer. And if we continue to dwell on this world, not of objects in the solidity with which language invests them, but of impressions unstable, flickering, inconsistent, which burn and are extinguished with our consciousness of them, it contracts still further; the whole scope of observation is dwarfed to the narrow chamber of the individual mind. Experience, already reduced to a swarm of impressions, is ringed round for each one of us by that thick wall of personality through which no real voice has ever pierced on its way to us, or from us to that which we can only conjecture to be without. Every one of those impressions is the impression of the individual in his isolation, each mind keeping as a solitary prisoner its own dream of a world.[9]

[5] See Blake (above, page 447).

[6] Johann Wolfgang von Goethe (1749–1832), German writer; George Gordon, Lord Byron (1788–1824), English poet.

[7] See Wordsworth (above, page 481).

[8] [Pater] "Somewhere Heraclitus says that everything changes and nothing remains." *Cratylus.*

Analysis goes a step further still, and tells us that those impressions of the individual to which, for each one of us, experience dwindles down, are in perpetual flight; that each of them is limited by time, and that as time is infinitely divisible, each of them is infinitely divisible also; all that is actual in it being a single moment, gone while we try to apprehend it, of which it may ever be more truly said that it has ceased to be than that it is. To such a tremulous wisp constantly reforming itself on the stream, to a single sharp impression, with a sense in it, a relic more or less fleeting, of such moments gone by, what is real in our life fines itself down. It is with the movement, the passage and dissolution of impressions, images, sensations, that analysis leaves off—that continual vanishing away, that strange perpetual weaving and unweaving of ourselves.

"Philosophiren," says Novalis, *"ist dephlegmatisiren, vivificiren."*[10] The service of philosophy, and of religion and culture as well, to the human spirit, is to startle it into a sharp and eager observation. Every moment some form grows perfect in hand or face; some tone on the hills or sea is choicer than the rest; some mood of passion or insight or intellectual excitement is irresistibly real and attractive for us—for that moment only. Not the fruit of experience, but experience itself is the end. A counted number of pulses only is given to us of a variegated, dramatic life. How may we see in them all that is to be seen in them by the finest senses? How can we pass most swiftly from point to point, and be present always at the focus where the greatest number of vital forces unite in their purest energy?

To burn always with this hard gemlike flame, to maintain this ecstasy, is success in life. Failure is to form habits; for habit is relative to a stereotyped world; meantime it is only the roughness of the eye that makes any two persons, things, situations, seem alike. While all melts under our feet, we may well catch at any exquisite passion, or any contribution to knowledge that seems, by a lifted horizon, to set the spirit free for a moment, or any stirring of the senses, strange dyes, strange flowers, and curious odors, or work of the artist's hands, or the face of one's friend. Not to discriminate every moment some passionate attitude in those about us, and in the brilliance of their gifts some tragic dividing of forces on their ways is, on this short day of frost and sun, to sleep before evening. With this sense of the splendor of our experience and of its awful brevity, gathering all we are into one desperate effort to see and touch, we shall hardly have time to make theories about the things we see and touch. What we have to do is to be forever curiously testing new opinions and courting new impressions, never acquiescing in a facile orthodoxy of Comte or of Hegel,[11] or of our own. Theories, religious or philosophical ideas, as points of view, instruments of criticism, may help us to gather up what might otherwise pass unregarded by us. *La philosophie, c'est la microscope de la pensée.*[12] The theory, or idea, or system, which requires of us the sacrifice of any part of this experience, in consideration of some interest into which we cannot enter, or some abstract morality we have not identified with ourselves, or what is only conventional, has no real claim upon us.

One of the most beautiful places in the writings of Rousseau[13] is that in the sixth book of the *Confessions,* where he describes the awakening in him of the literary sense. An undefinable taint of death had always clung about him, and now in early manhood he believed himself stricken by mortal disease. He asked himself how he might make as much as possible of the interval that remained; and he was not biased by anything in his previous life when he decided that it must be by intellectual excitement, which he found in the clear, fresh writings of Voltaire.[14] Well, we are all *condamnés,* as Victor Hugo says: *"les hommes sont tous condamnés à mort avec des sursis indéfinis":*[15] we have an interval, and then our place knows us no more. Some spend this interval in listlessness, some in high passions, the wisest in art and song. For our one chance is in expanding that interval, in getting as many pulsations as possible into the given time. High passions give one this quickened sense of life, ecstasy and sorrow of love, political or religious enthusiasm, or the "enthusiasm of humanity." Only, be sure it is passion, that it does yield you this fruit of a quickened, multiplied consciousness. Of this wisdom, the poetic passion, the desire of beauty, the love of art for art's sake has most; for art comes to you professing frankly to give nothing but the highest quality to your moments as they pass, and simply for those moments' sake.

INTRODUCTION: THE MODERN ERA

In the long history of philosophical and aesthetic speculation upon which this volume draws, developments from the later nineteenth century appear as both a culmination and a departure. What is striking in both respects is that modernism in virtually all of its manifestations has had the effect of calling into question the terms in which the prior history of thought about literature, the arts, and philosophy have been represented. It is not that the problems which surface especially in the twentieth century are new. The issue is the sometimes confusing process by which unexpected links and reconfigurations of problems come to light, often requiring a reconception of disciplinary—and interdisciplinary—histories.

In the specific case of literary criticism, one widely rehearsed version of its history, articulated most clearly by Murray Krieger, is the emergence of modern literary criticism as an academic specialty, the culmination of what Krieger has characterized as an *apologetic* tradition. It was driven by the attempt to defend poetry from its many and varied detractors, responding to Plato's notorious decision in *Republic* to have Socrates exile the poets from the ideal state.[1] This is a narrative that tends to be repetitive in the sense that no defense of poetry, no *apologia* for it, can be final or bring any guarantee that in the next generation (or even the next decade) some new attack against poetry will not emerge. More important, however, the apologetic tradition encourages the assumption that a definitive defense of poetry ought to be realized in a comprehensive theory of poetry as a specific subject of study. Whether it is Aristotle, apparently answering in his *Poetics* the charges of Plato, or later writers, from Dante and Boccaccio to Mazzoni and Sidney, or from Shelley to Frye, the defense of poetry has appeared to depend upon *argument:* if the attacker only understood what poetry *really* is and why it matters, the case would be closed and poetry would be vindicated, once and for all. Yet no argument has yet proved so powerful or compelling as to be genuinely decisive.

Though the point is clear only in hindsight (if at all), the assumption that there should be some ultimate and therefore decisive argument is contained from the start in the philosophical principles or concepts that shaped the original Socratic attack. The immediate response, that is to say, is likely to be not only apologetic but defensive, thereby granting to the opponent more than may be warranted. While there are cases (such as

---

[1] See Krieger, *The New Apologists for Poetry* (1956); *Theory of Criticism: A Tradition and Its System* (1976); and *The Institution of Theory* (1994).

Shelley's reply to Peacock, or Sidney's response to Gosson) where many details of the exchange are ironic, defenses of poetry are commonly directed, as it were, over the head of a specific detractor to a general audience, borrowing both the concepts and the rhetoric of theoretical discourse that may be fundamentally incompatible with poetry. The deeper problem is less some alleged defect in poetry than a radical insufficiency in the idea of theory itself. A little later, we will examine this matter in more detail, but it will suffice for the moment to recall that the idea of an intellectual theory of *anything* emerges from the very line of argument in Plato's *Republic* that excludes poetry—and the exclusion assumes that "truth" is simple, universal, and accessible to intellectual intuition. After Aristotle's *Poetics,* the subject of poetry is restored at least to the status of being discussable—but only within the framework of a theory of *Eidos* or Form that locates the truth or essence of things in some discernible invariance of form, whether it be an oak tree, a ship, or tragedy. That framework, for Aristotle as for us, is directly traceable to Plato, and is so pervasively incorporated into our ordinary modes of thinking that it effectively disappears as something obvious, something that goes without saying.

In this sense, the apologetic tradition since Aristotle has seemed to pursue a theory of poetry as its end, without necessarily taking up the question of whether or not the fault may lie less with poetry than with a conception of theory that assumes such a formal and timeless framework for truth—a conception congenial to the common understanding, but one that has often been reduced to paradox in the face of genuine novelties or the incontrovertible historical evidence that notions of truth change.[2] We have tended to assume that "truth" can only be empirically or logically discovered, and by necessity always was and always will be True. In this sense, statements valorized as true are distinguished from bare assertions of faith because they can be consistently identified as always being the case. Such truths as the fact that acorns always turn into oaks (but never pine trees), or that the specific relation for acceleration due to gravity is the same for all objects, serve as paradigmatic instances of theoretical propositions because they offer both an explanation and a basis for predictions, evidently grounded in the nature of things.

But what should a theory in criticism do, and what would it be a theory *of?* If a theory takes poetry, or more broadly, imaginative production, as its object, then the closure sought by traditional theorizing evidently does not fit. Poems are *not* among the natural kinds, like oak trees, nor are we interested in them because of their physical properties, as we are with boats. They matter to us because of their effects on thought and feeling, and there is no guarantee that anyone could distinguish a poem from random strings of graphical marks just by looking at it. Poems as such are recognizable only as they are *read* and *interpreted.* Taking poems as mental or ideal objects, however, would involve a contemporary critic in arguments hinging on a kind of Idealism most likely to be treated as either an anachronism or merely a gesture. But in any case, poems are deliberate constructions that we assume, in principle, to be intelligible and readable, just as they are also constructions that *address us,* frequently in immediate and practical ways, as in the celebrated line that concludes Rilke's "Archaic Torso of Apollo": "There is no place that does not see you. You must change your life."

---

[2] Consider, for example, Wittgenstein's incisive remark in *On Certainty* (1969) on the verb, "to know," which seems to imply a guarantee of certainty: "One always forgets the expression 'I thought I knew,'" p. 3.

In this sense, the preponderance of arguments in criticism taken as theoretical are in fact resolutely practical, having to do with judgments and complex relations pertaining obviously to persons and societies, more than to ascertainable and repeatable states of affairs as one would expect in the natural sciences. Moreover, the judgments and relations in question are *not* guaranteed by any direct accuracy in the depiction of events, but only by their intelligibility. If we view the twentieth century from the vantage of its closing decades, the most striking feature of criticism in this regard is the emergence and rapid rise of theory as a designation for a kind of discursive practice that seeks to situate literary works and other cultural products and artifacts within the social field and, to greater or lesser degrees, to examine them in a generally political (or moralistic) way. Unlike theory in other disciplines, recent theory in criticism appears not to have a definite object (even as it constitutes as a "text" any virtual object that can be talked about relative to some theme in discourse) but is instead an apparently unfolding analysis of a set of questions pertaining to such issues as representation, social justice, systems of value, cultural history, and highly charged contemporary topics such as race, gender, and class.

One among many reasons that recent theory in criticism has been controversial is that it thereby tends on the one hand to go very much against the grain of poetics in the apologetic vein, where recent literary criticism, far from defending poetry against its detractors, seems to take on the role of attacking poetry for its multifaceted complicity in the politics of privilege. But on the other, it also goes against the grain of traditional philosophical models of theorizing by substituting a politicized rhetoric for formal logic, and taking the disclosure of the illegitimate or unjust use of power as a more important issue than formulating propositions held to be incontrovertibly true. The resulting quarrels have been hot and difficult (as the habit of calling them "culture wars" suggests), since they are embedded within the crisis-ridden cultural-political reality of our times, where views about particular social issues have served as a kind of moral litmus test for right thinking—including vitriolic attacks on that very notion as an inherently dogmatic insistence on what has come to be called "political correctness."

But the larger (and older) question remains intellectual and philosophical, pertaining quite specifically to poetry as a paradigmatic product of human intelligence and imagination. From beginning to end, the twentieth century has confirmed the venerable point, sometimes ironically through the pursuit of purportedly "scientific" programs, that poetry is not a subject that lies still for patient observation upon a laboratory table. So what *does* poetry have to do with theory? If we understand that term as it is used in science to cover well-formulated and highly verified principles of explanation and prediction, the answer is, evidently, "Not much." At the other extreme, what does theory as a politically inflected practice of social critique have to do with poetry, considered as a richly exemplified practice and an art, a *techné,* and not simply the reflection of a particular ideology? To a convinced advocate of the apologetic tradition the answer might also be, "Not much." But that would be to ignore the most deeply embedded themes and preoccupations of poetry as a *subject matter* that have, after all, called forth the kind of politically inflected theory so prominent in recent years. To read Shakespeare as if his plays were not profoundly engaged with questions concerning the actual politics of kingship, or to strip away morality from Milton in *Paradise Lost* as if it were a mere rhetorical decoration would be to egregiously miss the point, as both John Crowe

Ransom and Robert Penn Warren observed over half a century ago. Poetry is not pure, and its vital complexity lies precisely in the fact that it speaks from and to a human world where all realities are multifaceted.[3]

The specific selections and the approach in this revised edition of *Critical Theory Since Plato* reflect an effort to articulate these issues more thoroughly and thoughtfully. It will be plain from perusing the table of contents that this edition does not simply carry on the generally aesthetic focus of the apologetic tradition, just as it obviously remains committed to the cultural and intellectual history that various defenses of poetry have *made.* So too, it will be clear that we have not attempted to create a comprehensive smorgasbord of currently practiced "approaches" to literary study and criticism. In an earlier companion volume, *Critical Theory Since 1965,* we took the step of broadening the horizon of what ought to be included in the study of "criticism" by adding an appendix that published, for the first time, a broad collection of materials that before 1965 would not have been seen as germane to literary study, but had definitely become so in the emergence of theory after the 1960s, including such figures as Saussure, Wittgenstein, Husserl, Horkheimer, Benjamin, and Lacan, to mention only a few. We believe that subsequent developments certainly justify having taken a broader than usual view of the field.

In this volume, for both theoretical and practical reasons, we are taking a more determined step in the same direction. On the practical side, literary study has virtually exploded (in more than one sense) since mid-century, with the remarkable institutional consolidation of the New Criticism in the 1950s followed by a larger international advocacy for Structuralism—and the equally remarkable and rapid implosion of both after 1965, in successive waves of postmodernist, postformalist, poststructurualist critiques that threatened for many decades to make crisis a permanent state of affairs.[4] What has emerged from this sustained ferment is a proliferation of orientations, practices, and approaches to the study of literature and culture, in the aggregate lumped together as theory, that seems to defy any obvious or cogent taxonomy. The emergence of deconstruction, feminism, postcolonial studies, studies of race, class and ethnicity, new historicism and cultural studies following Foucault, Raymond Williams, and others, queer studies, science studies, and so on, presents for the would-be anthologist what we have concluded is an impossible problem. The "field" is so various and fractured that only by an ill-advised indulgence of the fallacy of mimetic form could anyone hope to "represent" the field—and the result would be as various and fractured as the field itself appears to be, to say nothing of producing a volume so massive and unmanageable that it would be more a burden than a service to students and teachers alike.

Read symptomatically, however, this proliferation of sometimes warring factions and incommensurable approaches does have a much deeper coherence that we make bold to think indicates that we are entering a new epoch that is no longer well served by many of the models and methods that have shaped prior practice. Accordingly, we have not tried merely to "represent" ways of doing criticism (including, in current terms, cultural studies), but have taken a broader view of the problems that poetry has always presented, in the belief that a review of them will show with some precision why it is that no conventional idea of theory, from Plato to yesterday, has had much success with imaginative and creative thinking in *any* form. The self-complicating nature of this possibility is, we believe, now very well known, as it leads into the thickets of such dense paradoxes and deeply layered ironies that even the most intent and focused critics may be led step by step to the point of exasperation with literature precisely because it resolutely *refuses* to conform to the conventional political or philosophical wisdom of the moment. The now familiar complication is our intellectual desire for some conclusion, *any* conclusion, even it if is the embrace of paradox or contradiction as if it were unavoidable or necessary, or the suggestion by the late Paul de Man that the only truth about language is that it always lies, or that the only truth about poetry is that it cannot be read.[5]

---

[3] See, in this context, Robert Penn Warren's "Pure and Impure Poetry" (1943); reprinted in *New and Selected Essays* (1989).

[4] The irony in this case is particularly acute since "Structuralism" in certain fields, such as linguistics, had long been a dominant model, though severely challenged by the early work of Noam Chomsky (below, page 1166) from the late 1950s, whereas structuralism in literary criticism was just being introduced, at the very time deconstruction, following the work of Jacques Derrida, was calling it into fundamental question. Thus, Jacques Ehrmann's influential volume, *Structuralism,* from *Yale French Studies,* first appeared in 1966—the same year as the Johns Hopkins conference on "The Languages of Criticism and the Sciences of Man." Trade publication of both *Structuralism* and *The Structuralist Controversy* was delayed until 1970. In a certain sense, the story was over before it was barely begun.

Though it is not possible in the scope of this mid-volume introduction to present a very full argument, we must at least outline here how this revised edition presents a reconception of the history of modern criticism. The now commonplace observation that of all the scientists who have ever lived, something more than 90 percent of them are working today evidently also applies to literary scholars and critics, working in university literature and language departments. This is an institutional fact of enormous significance, as it reflects a cultural and political triumph, in the North Atlantic nations at any rate, in establishing systems of schools that are integrated at every level with government, business, and local communities. Over a decade ago, Evan Watkins pointed out that it had long since become virtually impossible for a person to graduate from any school in the United States, from elementary to postgraduate, without taking an English class.[6] If we bear this point in mind, the very impressive consolidation of Anglo-American New Criticism in the 1950s can be seen as a curricular and practical triumph, shaping not only a particular pedagogy that drew immediately on common speculative propositions overwhelmingly concerned with the activity of reading and interpretation, but leading to ambitious projects to rewrite (or write for the first time) the history of criticism as a single enterprise,[7] now, finally, properly housed in English and affiliated literature and language departments. To put the matter simply, the dominant twentieth-century reply to Plato has not been a definitive argument but a pervasive revision of the college catalogue.

It is in this context that the force of the apologetic tradition is most evident; since earlier discussions of theory were concerned with articulating an explanatory account of what a poem (or more generally a literary work) actually was, the compelling motive was to *place* poetry, in terms of its intellectual, moral, and social purposes. The arguments that prevailed, accordingly, were those that could be readily translated into pedagogical, curricular, and professional practices that created a transmissible institution for education, as is most clearly evident in the practice of the New Critics. Far from being

[5] See especially, "The Resistance to Theory" (below, page 1317).

[6] *Work Time: English Departments and the Circulation of Cultural Value* (1989).

[7] See especially W. K. Wimsatt and Cleanth Brooks's *Literary Criticism: A Short History* (1959).

"apologetic" in the colloquial sense, moreover, speculative critics from René Wellek to Roman Jakobsen, or Roland Barthes to Northrop Frye, explored the form, language, and structure of poetry as a systematic cultural project of imagining a human world that could be studied with methodological precision and sophistication, much as a physicist might study nature—despite the fact that appeals to this similarity, starting with Aristotle's treatment of the *form* of tragedy as something emerging from nature like an oak tree or a fish, seem wrong, even obviously wrong, from the start. Poetry has to be composed and *instituted,* by actual persons in real, historical societies, even if it appears obvious to poet and critic alike that the work itself comes from our deepest nature. The overwhelming problem is the nature of generative change that we now recognize pertains as much to our sense of the world of nature as it does to the domain of constructed human artifacts.

The overwhelming irony, moreover, is that the massive institutional success of modern literary criticism depends only in contingent ways on the status of any particular speculative or theoretical claims about literature. In simpler terms, the modern success of the apologetic tradition was not at all the attainment of a philosophically coherent and compelling theory, but the institution of a set of course requirements and pedagogical practices that, in effect, shaped the qualitative dimension of being a good citizen of a particular state, and more particularly, established an implicit ideal for the educated or cultured citizen. The peculiar dimension of such complex practices, as arguments, is that they elicit assent without necessarily disclosing the *reasons* for assenting.

The moment of modern, twentieth-century theory is already *post*modern in the sense that it comes into focus only *after* the modernizing work reflected in the institutional reality of schools, curricula, teaching methods, and professional organizations has already been done, with the deep and pervasive assent and support of specific national cultures and governments. Here too, theory follows practice, not just in the context of discourse about literary texts, but extending to the institutional rationale for teaching them at all. From this point of view, one of the primary accomplishments of the philosophers, poets, and critics of the late eighteenth and early nineteenth centuries was the invention of literary history, articulated in the humanists' vision of the wisdom of the ancients and an idealized vision of literature as a profoundly civilizing instrument, continued into the modern era as an extensive technology, even an industry, of the production of *texts* progressively and powerfully linking the literary history of particular languages and peoples to narratives of national glorification and sometimes, of parochial aggrandizement.[8] That is not to deny that a sense of professional probity may provide strong resistance to this kind of ideological narrowing, along with a more inclusive version of what literary education entails, but it cannot be taken for granted in the face of pressure to justify educational pursuits at every level in the terms of a localized view of the world. From the idea of a classical literary curriculum conceived as monuments of an extended civilization has followed a tendency for texts that have made it into the required curriculum to be singled out or justified in the light of displaced narratives concerning what it means to be truly English, or American, or French, and so on, thereby connecting the idea of the artistic "masterpiece" to a much more localized and opinionated pride in the "native" language and the nation state—an orientation that is all the more obvious in the fact that departments of "literature" are still relatively rare, but *English, French, Russian, German, Spanish* departments, and so on, are the rule. In these cases, moreover, attention to literature was not necessarily to be taken for granted, since in many instances, it was the teaching of the language that was foregrounded, on philological and linguistic grounds, as the foundation for appreciation and admiration of national literary monuments. In this respect, the steady shift of attention in recent years from the literary text as a privileged (national) object to the critical examination of the social and historical field carries on the work of literary history into the seemingly antagonistic practice of cultural studies, to complicate and criticize, if not to undo, the ideological link between the literary text and the reality of what has been taken to be coercive social and political power.

---

[8] See, for example, Coleridge's extensive discussion of national traits and character in *The Friend* I, 419–23. Since mid-century, moreover, this issue has been thoroughly debated as an issue of ideology and hegemony, especially by such thinkers as Althusser (below, page 1297) and Ernesto Laclau (below, page 1525).

Initially, this perspective on the problem can afford some protection against oversimplifying the issues, but only if we bear in mind that the radical implications of imaginative literature cannot be contained by such means, since the ideals in question depend, as even so severe a sociological critic as Pierre Bourdieu acknowledges, upon the practice of an art in which intellectual autonomy and profound discoveries concerning human experience are the very substance of its claim to serious regard.[9] This kind of counter-critique, presuming that just because literature, as received or taught, can indeed be drafted into the service of bourgeois ambition or class consciousness it is therefore illegitimate, may be motivated by a particular position on issues of class conflict or social resentment, but it provides no explanation at all for how imaginative literature actually does command willing assent, without coercion. In this respect, the value of disinterestedness that Kant associated with the aesthetic judgment survives even the most concerted assaults on the idea of the aesthetic as an apparent instrument of privilege. But the main point is that seeking social distinction by means of an art is still a particular *use* that may be made of it, whether it involves praising a poem by Tennyson or a narrative by Kipling as representing the epitome of proper English character or behavior, or as an appalling manifestation of colonial and imperialistic myopia. In either case, the radical potential of the poem as itself an instrument of thought, discovery, and critical redirection simply cannot be equated with the history of literary reception or with any particular set of accepted practices precisely because what it formulates as expression depends fundamentally on the principle of literary interpretation: there is no automatic read-out of meaning without engaging what T. S. Eliot, in *Four Quartets,* characterized as "the intolerable wrestle with words and meanings."[10] The generic intuition that separates, say, a poem from a treatise on topology, is that the meaning of the former is never uniquely determined by its correspondence with a particular set of independently verifiable facts or exact coordinates: poetry places itself in the middle of an exacting linguistic mediation that demands of us a reflective and speculative response.

The rise of theory and its seemingly inexorable movement in the direction of a politically inflected cultural studies appears in this light less a movement away from literature than it is a transforming continuation of the work of *literary history,* which since the time of Marx and Taine has *always* taken its primary cues from events and circumstances in the social and political field, as reflected most obviously in the fact that the markers of literary periodization are almost invariably drawn from such events as the ascension or death of monarchs, the starting or concluding of wars, the emergence of revolutions and riots, the rise and fall of political parties and administrations, and so on. While it is altogether too easy to take this as a true reflection of literature as a practice that follows the movements of society, it is more directly a reflection of the social reality of *criticism,* as itself an institutionalized practice.[11]

---

[9] See his *Rules of Art: Genesis and Structure of the Literary Field* (1995); cf. Bourdieu (below, page 1403).

[10] "East Coker," II, ll. 20–21.

The idea of a "return to literature" is wide of the mark since literary study, particularly the literary historical form in which it has been overwhelmingly institutionalized, routinely teaches literature by holding it, as it were, at arm's length, suspicious of any critical practice thought to be ahistorical, while giving preference to a scholarly focus on its social and political context, its sources and influences, and so on, even as it provides a justification for teaching literature directly or indirectly as part of the training (or indoctrination) of citizens. It is ironic that the apologetic tradition has in fact done what Plato did in his *Republic* but not what he demanded of the defenders of poetry: instead of developing a philosophically credible counter-theory, literary study has focused its attention on the idea and the construction of the modern Republic as both the nation-state and what Wlad Godzich has characterized as the "culture of literacy."[12] The modern guardians of the Republic, in this light, have taken up their duties from the outset not only by learning to read and write, but by a respectful acquaintance with the great literary and philosophical classics of their own civilization. To put it crudely, prospective guardians of the common good don't go anywhere without taking English 101, just as it is generally taken for granted that a deeper literacy is not merely a supplement to right thinking and good citizenship but a the virtual condition of both.

What is all the more interesting is that the institutional creation of a formal and academic literary culture, even though it has always felt embattled and vulnerable, shows its importance not in terms of its economic exchange value, but precisely because, even though it may be co-opted or even corrupted, it is *not offered for sale.* Rather, it operates with a public concern for cultural legitimation and justifies itself in and through reasoned argument that depends implicitly on standards of justice, intellectual honesty, and with a critical irony, disinterestedness, even when arguments are mounted from a partisan standpoint. The irony is just that in arguing, for example, for the inclusion of literary works by women or members of ethnic minorities, the argument presupposes that such a move *is* right and just, and that any fair-minded person would decide in favor, for example, of expanding the curriculum—and in fact, that has been the response. But the overall result is a profound sense of dialectical tension since the study of literature and the study of the culture that allows it to be created are jointly implicated in both asserting and calling into question the values that the culture may take for granted. For this reason, the recognition of contradictions and inconsistencies is not a matter to be treated lightly, for they touch upon a deeply embedded network of justifications that are rarely made entirely explicit but are nevertheless real and consequential as grounds for assent to common values. Moreover, assent is not a crisp matter, like counting votes: it is, on the contrary, carried out institutionally and incrementally.

---

[11] See in this context Sandor Goodheart's brilliant assessment in *Sacrificing Commentary: Reading the End of Literature* (1996) of the tendency of critical commentary to miss the radical implications of great literary accomplishments, systematically substituting the simpler *sources* of literary works for what their authors actually do with them, for example, treating the general myth of Oedipus as if it contained the meaning of Sophocles's play, *Oedipus Tyrannus.*

[12] See especially *The Culture of Literacy* (1994).

Thus in suggesting we have been living through an era of recurrent, even chronic crisis, we are also suggesting that it was no mere coincidence that the shattering of a formalist/structuralist paradigm in the 1960s appeared both as an intellectual impasse, an *aporia,* to use Aristotle's term for getting stuck, and as a gathering revolution in the field of cultural politics. On the one hand, the reliance on conceptions of form and structure was by no means just a modern methodological preference or a literary strategem, but the very cornerstone of Platonic and Aristotelian metaphysics, making any challenge to formalism a potential passage from a familiar sense of order to an apparent field of chaos. In this connection, challenges to literary formalism do not stop with logical or evidential objections because they are already implicated in assumptions about the cultural legitimacy of political and ethical principles, such as the idea of individual rights, the value of freedom, or the importance of justice as an essential component of a common literary heritage. Accordingly, the decades of recurrent crisis from the sixties well into the nineties carried intimations of something apocalyptic, as challenging familiar academic logic makes direct use of the very values that logic had helped to create, turned back upon themselves. Because such connections between a literary heritage and social values may appear to us as direct intuitions, drawn not from common sense but from what Kant called the "common understanding," literary arguments can move rapidly to endorse or embrace potentially revolutionary movements, from Third World wars of liberation in Asia, Africa, and Latin America, to profound concerns worldwide for issues of social justice and civil rights as proper to literary criticism. The treacherous difficulty is that such values, taken as intuitive or obvious, can thereby be severed from the actual processes by which they are inculcated, particularly through the acquisition of an advanced and sophisticated literacy. Justice, for example, which Plato presumed to be a transcendent and eternal Idea, was first formulated not by philosophers like Socrates but poets like Homer and Sophocles, and it persists in civil society not because it is available to us by some *a priori* intellectual intution, but only as it is restored imaginatively and reaffirmed by reasoning.

The link that has been pursued in literary studies between social questions and the structure of knowledge has had a tendency to superheat the sense of outrage and alarm on all sides of the debate, leading to such absurd charges as that highly verified and established scientific principles are merely the results of social construction by the governing classes—sometimes, with immediately tragic results, as in the espousal of such arguments concerning the HIV virus and its connection to AIDS in South Africa impeding both treatment and education concerning this epidemic[13]—and the equally absurd contention that the raising of such questions is purely a political move by "tenured radicals" or partisans on the lunatic fringe. The view we have taken here, once more, is that these debates, no matter how annoying or alarming they may be, are essential to a process of cultural legitimation that has always been linked to literature, not as something under indictment, but as an indispensable imaginative process of reflection and discovery that by its very nature cannot be effectively confined within the scope of any current ideology.

---

[13] See *New York Review of Books* (2002) series on AIDS in Africa, especially the reluctant response of Tdao Mbeke to accept as compelling scientific evidence concerning the connection between AIDS and the HIV virus.

The chief philosophical difficulty for literary speculation is that its primary traditions have taken shape in criticism as an extension of modes of dialectical argument that promise far more than they can deliver. If we begin from Aristotle's distinctly unflattering definition of dialectic as nothing like the inflated universal or "scientific" method of Hegel and Marx, but simply as that mode of argument that proceeds from commonplaces—what people already believe, what they are thought to believe, what the "best" believe, and so on—it is clear why dialectical argument is always inescapably problematic.[14] Whereas Plato had valorized dialectic in the *Phaedrus* as enabling thought itself (266b-c)—even though he himself invariably has recourse to stories when his arguments run into trouble—Aristotle saw more accurately that dialectic never did and never *could* arrive at unambiguous demonstrations because it was inherently bound by what participants already thought they knew. On that score, no invocation of Plato's doctrine of *anamnesis* or learning as recollection would ever suffice to expunge errors or eliminate paradoxes and contradictions already embedded in the common understanding.

It is beyond any serious question that in this light, the apologetic tradition in literary criticism has always been—and remains, even in its currently more contentious and accusatory mode—dialectical to the core. The appropriate conclusion to draw, however, is that to be dialectical means to be in the profoundest sense *untheoretical*—a point we believe applies with no diminished force to current theory—and therefore remains, in all essential respects, entirely within the range of arguments that start and end with commonplaces. For precisely this reason, there is no point at which one cannot continue the examination of the rhetoric of any dialectical argument to make significant and typically distressing discoveries concerning the web of elements that are already and always embedded in the actual beliefs people may happen to hold. What thereby tends to escape notice is the very process by which such beliefs are established and communicated at the outset, including the very language within which such beliefs are framed. In making such an argument, we do not mean to suggest that criticism ought to become, in some way, a science, but that the framework of beliefs and assumptions that have been dominant in the great traditions of literary criticism and philosophy alike are undergoing significant changes that will transform the questions we ask.

Similar conclusions have been reached, though usually in very different terms, as one field after another in the twentieth century has taken the "linguistic turn," in the reflective and critical examination of the nature of language as a mediating instrumentality.[15] The very vividness of the form in which this problem emerged in literary study, however, has had a tendency to block the recognition of its generality. The appearance of deconstruction at what was imagined to be the triumphant ascension of structuralism, for example, seemed a very specific crisis pertaining mainly to literary critics and scholars.

---

[14] See *Topics* and *Sophistical Refutations*. It is germane in this context that Kant followed Aristotle in characterizing dialectic as a "logic of illusion."

[15] Though the phrase itself appears to have originated with Gustav Bergmann, the move it designates is unmistakable with such figures as Peirce, Frege, Wittgenstein, Russell, Carnap, Schlick, I. A. Richards and C.K. Ogden, Saussure, and others. See Richard Rorty, ed., *The Linguistic Turn: Essays in Philosophical Method* (Chicago: University of Chicago Press, 1967; 1992).

This overlooks, with what we take to be unfortunate consequences, the senses in which the admittedly dramatic "moment" of deconstruction in the mid-1960s, was a repetition and reflection of earlier episodes in the history of science, the formalization of symbolic logic and the development of analytical philosophy, all of which led to the disclosure of profound paradoxes lying at the heart of Western philosophy and metaphysics.[16]

In this light, what some may regard as the most unexpected selections in this volume, from such thinkers as Frege, Wittgenstein, Bertrand Russell, and Rudolph Carnap, are here because they show a sometimes astonishing similarity of argument on questions concerning language and representation as we find later in such critics and philosophers as Paul de Man or Jacques Derrida. In continuing along the path we took in *Critical Theory Since 1965,* we think the benefit of seeing philosophers who may have been regarded even as enemies facing the same problems along the sinuous path of the "linguistic turn" may serve as something more than a corrective of perspective concerning academic and field-specific antagonisms. It is, in this light, significant that Richard Rorty's influential anthology, *The Linguistic Turn: Essays in Philosophical Method* (1967), marked for analytical philosophy, with scarcely any mention whatsoever of literary studies, the kind of turning point manifest for literary study in Richard Macksey and Eugenio Donato's *The Structuralist Controversy* (1967), itself with scarcely a mention of analytical philosophy.[17]

If as we are inclined to think, we may be at the threshold of a new era in critical thought, it is evident that a more balanced and productive concourse between literary study and philosophy is necessary, as both fields share a profoundly intertwined history and a common lineage traceable back to Plato's *Republic,* the source not only of his severe strictures against poetry in Book Ten, but also his first full elaboration of his theory of *eidos* or Form in Books Six and Seven. The immediate difficulty is that there is, at present, no convenient way for literary critics and philosophers particularly in the English-speaking world, to carry out such conversations, when the two fields more resemble two bundles of splinters than two branches of the same historical tree, where philosophy no more appears as a unified or coherent field than does literary criticism.

For many reasons, perhaps the most important and problematic figure in this connection is Jacques Derrida, who came to the attention of literary scholars and critics primarily through his rhetorically dramatic and ingenious demonstrations that it is all but impossible ever to explain the idea of structure without already invoking it, thereby calling into question a considerable string of concepts, from "representation" to "meaning." While early on this provided a way to problematize radically the critical expectation that close attention to poetic form and structure would disclose the meaning of a poem as the direct product of a precise, possibly *sui generis* verbal artifact, it presented a more intractable problem itself, not dissimilar to the notorious problems of verification in the modern history of logical positivism, or to the problems Plato faced 2,400 years earlier in his *Parmenides* and *Sophist.* In all instances, the critical discovery is that signification turns out to be an infinite chain of differences with no definitive termination in a positive term.

---

[16] It should be noted, moreover, that, as Rorty's anthology makes evident, the "linguistic turn" in analytical philosophy provoked very much the same kind of surprised and localized reaction among professional philosophers. See especially work by Rudolph Carnap (below, page 978).

[17] We note and register, however, our dissent from Rorty's later suggestion in his 1992 retrospective postscript, "Twenty-five Years After," that the "linguistic turn" was just "one more tempest in an academic teapot," a gesture with all the appearance of a no-longer "thirty-three-year-old philosopher" trying perhaps to convince himself that collective failures to solve the problem are equally unimportant.

For the New Critics, the idea of literary form had seemed to anchor claims about interpretation as capable of providing truth and value that could not be attained in any other way than by the nuanced use of metaphor, but in practice had not only degenerated into what Robert Scholes once encapsulated in the image of "a clever graduate student 'interpreting' the daylights out of a poem before thirty stupified freshmen"[18] but had broken out into surprisingly inept but nevertheless spirited quarrels over the determinacy or indeterminacy of interpretation.[19]

The case against Structuralism was in some ways more stunning, particularly because of the philosophical analyses by Jacques Derrida, beginning with his brilliant critique of Edmund Husserl in *Speech and Phenomenon,* but with a little more flash in his "Structure, Sign and Play," which by our incomplete survey appears to be the most widely anthologized critical essay of the last fifty years, matched only by T. S. Eliot's "Tradition and the Individual Talent" of 1919. It is in this case that a disquieting feature of Anglo-American speculative criticism becomes obvious: its pervasive, even appalling lack of cogent philosophical support or argument. No small part of the reason is that academic philosophy, in both the United States and the United Kingdom, had followed different but largely parallel trajectories to refocus the mission of philosophy as immediately tied to the clarification of scientific theory (following Russell, Carnap, and other analytical philosophers) or the clarification of logic, language, and concepts (following Wittgenstein, Quine, Austin, and other philosophers attending particularly to language). In both cases, the traditional subjects of aesthetics and ethics were sometimes very frankly and openly relegated to the philosopher's idle time, or treated institutionally as academic classes to assign to faculty members and graduate students who were not up to the demands of "real" logical analysis or the philosophy of science.

The more or less open enmity between faculty in English departments and philosophy departments meant, among other things, that the ordinary curriculum of professional training in literature throughout most of the twentieth century did not include *any* formal study of philosophy—and vice versa. Thus, for example, when Cleanth Brooks, in his very influential book, *The Well-Wrought Urn,* came to the end of his lucid essays on texts and, as it were, discovered the need for philosophical support, he turned to Suzanne Langer for logic and Wilbur Urban for ethics. While both are thinkers of interest, their own interests and orientation appear far removed from the prevailing patterns among their philosophical contemporaries. The problem, of course, is that the prevailing discussion in academic philosophy was uncongenial if not positively hostile to the idea that poetry presented any genuine problems for philosophy. What is entirely missing among Anglo-American critics attending to problems of poetic language and form is any acknowledgment (except in the deeply ironic case of R. S. Crane at Chicago)[20] that the dominant tendency in Anglo-American philosophy had foregrounded the importance of both topics even more strikingly. The difference, following Carnap's claim from the 1930s, was that only statements that could be confirmed by empirical reference had any cognitive content, leaving statements in poetry and metaphysics as expressive but essentially "meaningless."

---

[18] 1975 MLA convention forum address, Semiotics and Literature.

[19] See especially E. D. Hirsch, *Validity in Interpretation* (1967), and Jonathan Culler, "Beyond Interpretation" in *The Pursuit of Signs* (1981).

[20] The irony in this case is that Crane is virtually alone in citing Rudolph Carnap's classic essay "Empiricism, Semantics, and Ontology" as support for his idea of critical pluralism. For a brief account, see Leroy Searle, "The New Criticism" in *The Johns Hopkins Guide to Criticism and Theory.*

The appearance on the scene of such a thinker as Derrida had a perhaps exaggerated impact precisely because he was writing and thinking from within a European academic context where this kind of virtual divorce between literary and philosophical education might have seemed strange if not positively barbaric. By the same token, however, the introduction of contemporary continental philosophical practice by way of literary criticism only made the divide between continental and Anglo-American analytical philosophy appear all the more stark—while doing very little to heal the deep rift between literary critics and philosophers in Anglo-American universities.[21] For an American trained philosopher, for example, the study of Hegel would perhaps have appeared a waste of time and the tradition of Hegelian idealism itself a kind of bad joke, whereas a French or German trained philosopher would find such a dismissive attitude incomprehensible. The point here is that the divide between literary and philosophical education in Anglo-American universities around mid-century had already been played out in philosophy itself. In the continental tradition, following Husserl, Heidegger, Kojéve, and Sartre, for example, professional discourse had long since diverged from a tradition of logical analysis and the philosophy of science following Frege, Wittgenstein, Carnap, and other members of the Vienna Circle that exerted a much more pronounced influence on Anglo-American traditions. Conversely, analytic philosophy since Frege, Russell, and the early Wittgenstein, had largely abandoned the sweeping post-Hegelian dialectical projects from Husserl to Heidegger and Sartre as unproductive.

In the training of American literary critics, on the other hand, philosophy of any description hardly appeared in the curriculum at all. Accordingly, the appeal of continental philosophy was surely enhanced by the fact that it was not so overtly hostile to literary study as local analytical philosophy. Thus, as a new generation of American literary critics pursued their interests in continental philosophy, it was frequently at the expense of any engagement with the kind of rigorous analysis of logic and science at which Anglo-American philosophy excelled.

It would be the continuation of a grave mistake to assume that this was no loss, for it has had the effect of insulating and marginalizing a good deal of the speculative thinking in literary study and the humanities from what is, by any account, one of the most massively important intellectual adventures of the twentieth century, the developments in natural science and technology. This has not meant that thinkers in the humanities have therefore relinquished their congenial, almost hereditary role as critics where science and technology are concerned, but such criticism has been pursued in many cases with an embarrassing ignorance of what scientists and their philosophical advocates have thought science was about, together with the propounding of arguments that would earn one a failing grade in any elementary course on logical reasoning. This has been manifest not merely in the "bad writing" contests staged every year by such journals as *Philosophy and Literature,* or in such mischievous episodes as the now notorious Alan Sokal affair, where an obviously fraudulent essay, adapting the rhetoric and the terms of fashionable postmodern criticism to the problem of "quantum gravity" was submitted to a critical journal for the explicit purpose of showing quite effectively that where scientific arguments were concerned, the purveyors of such criticism could not tell, as Hamlet puts it, "a hawk from a handsaw" no matter the quarter from which the wind were blowing.[22] The deeper problem is that the relation of science to criticism has been more or less systematically distorted. The commonplace from C. P. Snow that scientists and humanists occupy "two cultures" prevails not because it reflects some fundamental or necessary truth but because there has been no mediating critical discourse to clarify what is, after all, a common matrix of problems that are all set within one common culture of advanced study and inquiry.

---

[21] Typical of these problems was a high degree of uncertainty, when analytically oriented philosophy departments conceded the possible value of hiring someone to teach "continental" philosophy found themselves at a loss because all the candidates seemed in their eyes to be vaguely (if not blatantly) fraudulent. A similar but more focused and notorious case arose in England in the 1990s, when Jacques Derrida was proposed as a recipient of an honorary degree from Oxford, only to have the nomination met with vitriolic opposition and contempt.

In this section of this anthology, accordingly, we have tried to provide not only a representative sampling of crucial arguments that are a continuation of the apologetic tradition, and essays that have exerted a profound shaping effect on the development of contemporary academic institutions in literary study, but a number of pivotal essays and selections that suggest a provisional outline or survey of problems that have occupied many other disciplines over the past century. On the one hand, we have included a number of essays concerning logic, language, and metaphysics, all with an important bearing on thinking about problems of meaning and interpretation. In the same vein, we have included some selections that may, at least initially, strike the reader as very challenging indeed, because they take up, in various ways, what we believe is a core metaphysical problem concerning the very idea of truth, not as something that can be grasped directly by intellectual intuition but must, on the contrary, be constructed.

While this idea may already be reasonably well domesticated, the forms of reasoning by which to pursue a conception of reality as *not* fixed and determined in advance, but open to novelty, to evolution, and to what Charles Sanders Peirce characterized as "habit-taking," are by no means yet settled or familiar. One speculative claim we would wish to introduce is that the very reason imaginative literature has been problematic in Western philosophy lies in a dominant theory of reason that has proved systematically prone to contradictions and paradoxes especially in the effort to explain dynamic, changing systems. It follows that Plato's original charge against poetry reflects less on some fault to be guarded against in works of the poets than on a fundamental insufficiency in the primary traditions of Western metaphysics that posits as necessary and sufficient an impoverished binary conception of reality, whether it takes as paradigmatic *form* and *matter,* or *subject* and *object.*

The view that truth can be understood as a direct representation of "objective" realities fundamentally misrepresents the logical complexity of mediation, and tends to trade upon a correspondingly inadequate dogma concerning the nature of reasoning. Literature, in this light, should not be viewed merely as an object about which to reason, but rather as a primary form of reasoning in its own right, a system of civilizing mediation by which commonplace opinion makes its first genuine moves toward self-conscious reflective thought.[23]

---

[22] For a comprehensive review of this case, including a republication of Sokal's original essay, "Transgressing the Boundaries: Toward a Transformative Hermeneutics of Quantum Gravity" (1996), see *The Sokal Hoax: The Sham that Shook the Academy,* ed. by Jeffrey Kittay and the Editors of *Lingua Franca* (Lincoln, Neb.: The University of Nebraska Press, 2000).

In the plan of this revised edition, we are staking a great deal on this conjecture, since if it is sound, the history of criticism since the late nineteenth century looks very different indeed. Instead of an accelerating proliferation of approaches, theories, schools, ideologies, and agendas, both intellectual and political, having less and less common ground, one can see this process as the symptom of a much more coherent set of problems that can be traced in virtually all disciplines and fields. At the outset, the overriding issue in theoretical terms is the problem of symbolic mediation that accompanies any expression, assertion, or claim. Whether the point of departure is Plato or Descartes, Hume or Kant, the project of reason has assumed on the one hand a fully determinable structure in the universe and on the other, specific mental powers that enable (or circumscribe) our knowledge. It is within the framework of these problematic assumptions that the "linguistic turn" is important, not because it provides any resolution for older oppositions or immediate answers to ancient questions, but precisely because it changes the questions. From Coleridge's overly ambitious and ill-fated project to construct a "Logosophia" or "Dynamical Philosophy" that rejected the dialectical illusions of Hegel and other "Doctors of the Absolute," or Charles Sanders Peirce's equally ambitious and ill-fated project to develop his "Pragmaticism" along interestingly similar lines as a post-Kantian critical realism, the turn to the language and, more broadly, to the logic of mediation, has been and remains irresistible.

We have endeavored, accordingly, to focus attention on different traditions from the late nineteenth through the twentieth century by selecting essays and excerpts that can function as a schematic overview of developments that we believe are relevant to the current state of critical theory, by acknowledging explicitly the need for a broader and more encompassing perspective. The problem outlined above of divergences between literary criticism and philosophy are equally evident in other areas as well. In the formal study of language, for example, contemporary literary criticism has been remarkably fixated on the early work of Ferdinand de Saussure, in large measure because other critics and philosophers (such as Barthes, Derrida, Foucault, and de Man) have turned their attention there. But Saussure's account of language, for all its historical importance, is scarcely a model for theorizing about language, or even, for that matter, about the linguistic sign. What is missing is any sense of what happened to "structuralism" in subsequent linguistic theory, following Bloomfield, Whorf and Sapir, and especially Chomsky. The point of interest here is not that one will find any satisfactory general theory of language, whether in Saussure or any subsequent linguist, since the persistent frustration of just such a search is an intrinsic part of the broad intellectual and cultural climate that pervades the Humanities and Social Sciences. It is, moreover, an additional point of interest that any attempt to formulate a theory of language that leaves the poetic out of account is fundamentally flawed by that fact alone.

---

[23] For a further exposition of this idea, see Leroy F. Searle, "The Conscience of the King: Oedipus, Hamlet, and the Problem of Reading" *Comparative Literature* 49 (1997). See also Eric Havelock's *Preface to Plato* (Cambridge, Mass.: Harvard University Press, 1963) and *The Literate Revolution in Greece and Its Cultural Consequence* (Princeton: Princeton University Press, 1982), for very suggestive illustrations of the antiquity of this point of view as a shaping force in the development of literate traditions.

We take it as already sufficiently clear that any coherent theory of poetry would require other theories—of language, of persons, of societies, of history, and some intelligible account of value—that are not to be found by turning to contemporary linguistics, psychology, anthropology, history, or philosophy, since all of these areas of intellectual concern find their theorizing activities in just the same plight as literary criticism. In looking for essential argument in many fields, however, it is not merely our intent to make this an interdisciplinary anthology, but rather to foreground sets of problems that seem to us to be fundamental. Taken together, these problems, beleaguering many different disciplines, show a significant pattern of convergence not toward a comprehensive theory in the old sense, but what amounts to a metaphysical change, affecting our conceptions of reality and thereby changing our understanding of what theories are for and what they ought to do.

Virtually all twentieth-century disciplines have experienced something like the "linguistic turn," in large measure a turning away from the prevailing account of representation that treats a word as if it were in some way a "picture" of a thing (or, following early Wittgenstein, a fact or state of affairs) always presumed to exist prior to the representation. But every attempt to establish this seemingly obvious principle has led to paradoxes and contradictions—and not merely by defect of logical cleverness or acuity of mind. What is still required is a much subtler theory of mediation, not the pseudojouissance of looking at language and finding, gleefully, paradox and aporias everywhere. We should not minimize the difficulty of moving beyond what have now become predictable insights concerning indeterminacy or the insufficiency of traditional "essentialist" modes of thought, but neither should the necessity of doing so be ignored. Some among the entries included here do point in this direction, particularly selections from Charles Sanders Peirce, who formulated the problem as a link between logic and metaphysics, based on his own intense critique of Kant, as early as 1867. Peirce's approach to semiotics (a word he was among the first to use) is in this respect dramatically different from semiology following Saussure, since it departs in a fundamental way from the binary opposition between signifier and signified to present a much fuller and more coherent account of mediation, not as a barrier to the determination of meaning, but as a fundamental process. While there is no question that this way of thinking is not well domesticated, it at least suggests that in examining problems of representation, we should note that the classic model in which a word represents a preexisting concept or thing is a theory of language that has never yet failed to fail, arguably because it is radically inadequate to account for the processes by which our thinking, as well as nature itself, unfolds and develops.

In the same vein, it is the unfolding of disciplinary and institutional lines of inquiry that we have tried to sample, not necessarily because they are connected directly to literature, but because they have initiated inquiry and speculation that continues to influence our collective thinking. The picture we wish to sketch is of the possibility of a genuinely philosophical poetics, a possibility that depends fundamentally on changing (as we manifestly *are* changing) our notions of what *philosophy* and *poetics* might be. The selections here begin with Taine, whose work can be taken as the beginning of the modern writing of literary history. They continue with Peirce and Walt Whitman, who bring together the two metathemes that have served provisionally to organize our work on this project. The first, as already indicated, is the problem of mediation, leading to a pervasive and problematic repetition of the "linguistic turn," in the dramatically uneven exploration of problems of representation, meaning, and metaphysics. The second, however, is more directly social and practical, since it takes up such problems as the relation between imagination and identity, and between power and politics, within a larger critical discourse of justice.

In the first context, we add our efforts to the many attempts, all so far disappointing, to frame discussions between literary criticism and philosophy that reflect the complexity of the problems of representation and meaning, and their bearing upon issues of metaphysics, or what Aristotle called "first philosophy." The immediate problem is the notorious fractiousness of groups of literary critics who violently disagree with each other, mirrored almost exactly by groups of philosophers who do the same. In both cases, the heat of the disagreement reflects a reliance on principles held to be self-evident or already established or on *a priori* claims that impede and complicate understanding. In such areas as the study of metaphor, for example, the long-standing distrust of it has obscured the fact that metaphor is not an aberration but an indispensable instrument of all thought, all predication, without which even the elementary principle of symbolic substitution in mathematics would be unthinkable. Similarly, the prejudice that if an expression is fictional it is therefore necessarily false merely blocks a more attentive consideration of how it is that our hypotheses shape mental experience—including the complex process by which a *fact* is ever recognized and acknowledged *as such*.

In the second context the problems are perhaps more difficult, if that is possible, than aiming for a more informative and intelligent conversation between long-divided and -fractured disciplines. The practical questions, political and moral, that are involved in the fraught process of cultural legitimation need exactly the same kind of patience and intellectual care, an attentiveness made all the more difficult because the questions affect us all directly. Once again it is instructive to return to the masterpiece of Plato's middle period, the ***Republic,*** where the decision to exile the poets was covered, as by an alibi, under the charge that they were untruthful as well as irrational, framing the monumental discussion of the idea of justice that starts and ends with the vexatious poets. But the argument of ***Republic*** reflects an even more fundamental problem of trying to reason about moral and political matters without prejudice. In Plato's case, moreover, his insistence upon a simple idea of truth as the guarantor for proper argument, long after he had left behind the artifice of speaking through Socrates, obscures the fact that his own reasoning about moral and political matters was already shaped, at every turn, by the very poets he called into question. If anything, the passions of the last half century have made this problem even more difficult, as the fierce search for villains and oppressors neglects the sobering principle enunciated by William Blake that we "become what we behold." The logical commonplace that one cannot argue from "IS" to "OUGHT" is itself an artifact of a theory of reality and a corresponding theory of reasoning that has always neglected the subtle complexities of imagination as a fundamental power of the mind, and no mere faculty for one's idle time or the production of merely pleasant artifacts, just as it is not a direct pipeline to the muses or the divine that does not require critical reflection.

The most contentious debates in recent criticism are themselves a continuation of a long and difficult discourse of justice, in which such questions as identity, politics, and power are precisely the issues that imaginative art has always addressed in its own ways.

The task before us is to learn more explicitly and fully how imagination and reason can be allies.

The critical dimension of this task lies in discerning, first of all, how the specific themes and issues in contemporary debates can be understood as a continuation of the history from which they have arisen. Just as imaginative literature is a primary form of reasoning, a critical response to it is part of an essential dialogue by which public discourse is shaped and our common, civic understanding is forged. In the current climate, the emergence of cultural studies is the continuation of a long historical trajectory, punctuated by essential discussions of aesthetics and poetic form, by which practical questions are shaped, generally by dialectical means, to ask specifically what is right, what is tolerable, what is good. But at the same time, the serious risk is that the very values invoked in arguing on behalf of individual rights, for social justice, for the fair and equal treatment of racial and other minorities, can themselves be taken for granted as already established. The role of imaginative literature in this context is that it recognizes the fragility of such ideas as justice, and the intimate negotiations by which ideas take hold, person by person, in the concrete exploration of human consequences that can be seen perhaps only in imagination. It follows that any departure from engagement with imaginative texts puts at risk the very values that animate criticism by threatening to turn those values into dogmatic formulas.

We are mindful that the current sense of institutional malaise, reflected in a host of books and essays asking, in various ways, what has happened to the humanities, presents the same dilemma on a larger scale. When colleagues represent each other as enemies, everyone loses. But if, in the present, we recognize the slow and patient historical rhythms by which literature, criticism, and philosophy all develop, there is reason to be confident that the continuing enterprise of critical theory, since Plato, is alive and well.

Hippolyte Adolphe Taine

1828–1893

During the latter half of the nineteenth century there was an attempt to relate scientific method to literary creation and criticism. The analogy between literary creation and experimental method, which can be seen to have followed out of Bacon (above, page 234), was roughly developed in Zola's *Experimental Novel* (below, page 699). An application of something like scientific method was brought into literary criticism in Taine's well-known and influential *History of English Literature,* in which he treats literature not in respect to the psychology of the audience or its reflection of the outer world but as documents for the analysis of an age and a people. Taine begins by arguing that we seek in literature an insight into the inner life of the author. We recognize in this remark vestiges of a central concern of much Romantic criticism. But Taine goes on to suggest that biographical knowledge is only a step to the greater end of understanding a whole people *and their moral condition. The end to which literature is to be put is a total historical vision*, and this vision will be the result of a scientific process. Taine's view is consistently materialistic and deterministic: "Vice and virtue are products, like vitriol and sugar."

Taine views literature less as a force acting on thought and society than as the result of natural and social factors—race, surroundings, and epoch. It is a class of events regulated by general laws yet to be discovered, pieces of evidence that will contribute to a total view of man.

Yet there is another Taine who does not wish to reduce literature to the rank of just any sort of document: "A great poem, a fine novel, the confessions of a superior man, are more instructive than a heap of historians and their histories." The reason is that literature offers us "the psychology of a soul, frequently of an age, now and then of a race." One might ask how literature can be more valuable than history if its purpose is to serve as documents for historians. This sort of question was asked increasingly in the latter half of the nineteenth century, and the questioning culminated in the attacks on historical criticism made by the New Critics in the first half of the twentieth century. But historical criticism, never really absent as practice, returns in a new guise later on.

The standard translation from the French of Taine's *History of English Literature* is by Henri van Laun (1871). Taine's *Lectures on Art* have been translated by John Durand (1877). An important study is Paul Neve, *La Philosophie de Taine* (1908). See Irving Babbitt, *Masters of Modern French Criticism* (1912); A. A. Eustice, *Hippolyte Taine and the Classical Genius* (1951); S. J. Kahn, *Science and Aesthetic Judgment: A Study in Taine's Critical Method* (1953); H. H. Clark, *The Influence of Science on American Literary Criticism 1860–1910 Including the Vogue of Taine* (1956); Leo Weinstein, *Taine* (1972).

from

History of English Literature

Introduction

> *The historian might place himself for a certain time, during several centuries or amongst a certain people, in the midst of the spirit of humanity. He might study, describe, relate all the events, the changes, the revolutions which took place in the inner man; and when he had reached the end, he would possess a history of the civilization of the nation and the period he selected.*
>
> FRANÇOIS GUIZOT[1]

History has been revolutionized, within a hundred years in Germany, within sixty years in France, and that by the study of their literatures.

It was perceived that a work of literature is not a mere play of imagination, a solitary caprice of a heated brain, but a transcript of contemporary manners, a type of a certain kind of mind. It was concluded that one might retrace, from the monuments of literature, the style of man's feelings and thoughts for centuries back. The attempt was made, and it succeeded.

Pondering on these modes of feeling and thought, men decided that in them were embalmed facts of the highest kind. They saw that these facts bore reference to the most important occurrences, that they explained and were explained by them, that it was necessary thenceforth to give them a rank, and a most important rank, in history. This rank they have received, and from that moment history has undergone a complete change: in its subject matter, its system, its machinery, the appreciation of laws and of causes. It is this change, as it has happened and must still happen, that we shall here endeavor to exhibit.

I

What is your first remark on turning over the great, stiff leaves of a folio, the yellow sheets of a manuscript—a poem, a code of laws, a declaration of faith? This, you say, was not created alone. It is but a mold, like a fossil shell, an imprint, like one of those shapes embossed in stone by an animal which lived and perished. Under the shell there was an animal, and behind the document there was a man. Why do you study the shell, except to represent to yourself the animal? So do you study the document only in order to know the man. The shell and the document are lifeless wrecks, valuable only as a clue to the entire and living existence. We must reach back to this existence, endeavor to recreate it. It is a mistake to study the document, as if it were isolated. This were to treat things like a simple pedant, to fall into the error of the bibliomaniac. Behind all, we have neither mythology nor languages, but only men, who arrange words and imagery according to the necessities of their organs and the original bent of their intellects. A dogma is nothing in itself; look at the people who have made it—a portrait, for instance, of the sixteenth century, the stern and energetic face of an English archbishop or martyr. Nothing exists except through some individual man; it is this individual with whom we must become acquainted. When we have established the parentage of dogmas, or the classification of poems, or the progress of constitutions, or the modification of idioms, we have only cleared the soil: genuine history is brought into existence only when the historian begins to unravel, across the lapse of time, the living man, toiling, impassioned, entrenched in his customs, with his voice and features, his gestures and his dress, distinct and complete as he from whom we have just parted in the street. Let us endeavor, then, to annihilate as far as possible this great interval of time, which prevents us from seeing man with our eyes, with the eyes of our head. What have we under the fair glazed pages of a modern poem? A modern poet, who has studied and traveled, a man like Alfred de Musset, Victor Hugo, Lamartine, or Heine,[2] in a black coat and gloves, welcomed by the ladies, and making every evening his fifty bows and his score of bon mots in society, reading the papers in the morning, lodging as a rule on the second floor; not over gay, because he has nerves, and especially because, in this dense democracy where we choke one another, the discredit of the dignities of office has exaggerated his pretensions while increasing his importance, and because the refinement of his feelings in general disposes him somewhat to believe himself a deity. This is what we take note of under modern meditations or sonnets. Even so, under a tragedy of the seventeenth century we have a poet, like Racine[3] for instance, elegant, staid, a courtier, a fine speaker, with a majestic wig and ribboned shoes, at heart a

---

Taine's *Histoire de la littérature anglaise* was published between 1863 and 1867. The text is from the translation by Henry van Laun (1871).

[1] François Pierre Guillaume Guizot (1787–1874), French statesman and historian, *Civilization in Europe.*

[2] Musset (1810–1857), Hugo (1802–1885), Alphonse Marie Louis de Lamartine (1790–1869), all French writers; Heinrich Heine (1797–1856), German poet.

[3] Jean Racine (1639–1699), French dramatist.

royalist and a Christian, "having received the grace of God not to blush in any company, kings nor Gospelers"; clever at entertaining the prince, and rendering for him into good French the "old French of Amyot"; very respectful to the great, always "knowing his place"; as assiduous and reserved at Marly as at Versailles, amidst the regular pleasures of a polished and fastidious nature, amidst the salutations, graces, airs, and fopperies of the braided lords, who rose early in the morning to obtain the promise of being appointed to some office in case of the death of the present holder, and amongst charming ladies who count their genealogies on their fingers in order to obtain the right of sitting down in the presence of the king or queen. On that head consult St. Simon and the engravings of Pérelle, as for the present age you have consulted Balzac and the watercolors of Eugène Lami.[4] Similarly, when we read a Greek tragedy, our first care should be to realize to ourselves the Greeks, that is, the men who live half naked, in the gymnasia, or in the public squares, under a glowing sky, face to face with the most noble landscapes, bent on making their bodies nimble and strong, on conversing, discussing, voting, carrying on patriotic piracies, but for the rest lazy and temperate, with three urns for their furniture, two anchovies in a jar of oil for their food, waited on by slaves, so as to give them leisure to cultivate their understanding and exercise their limbs, with no desire beyond that of having the most beautiful town, the most beautiful processions, the most beautiful ideas, the most beautiful men. On this subject, a statue such as the *Meleager*, or the *Theseus* of the Parthenon, or still more, the sight of the Mediterranean, blue and lustrous as a silken tunic, and islands arising from it like masses of marble, and added to these, twenty select phrases from Plato and Aristophanes, will teach you much more than a multitude of dissertations and commentaries. And so again, in order to understand an Indian Purāna, begin by imagining to yourself the father of a family, who, "having seen a son on his son's knees," retires, according to the law, into solitude, with an ax and a pitcher, under a banana tree, by the riverside, talks no more, adds fast to fast, dwells naked between four fires, and under a fifth, the terrible sun, devouring and renewing without end all living things; who step by step, for weeks at a time, fixes his imagination upon the feet of Brahma, next upon his knee, next upon his thigh, next upon his navel, and so on, until, beneath the strain of this intense meditation, hallucinations begin to appear, until all the forms of existence, mingled and transformed the one with the other, quaver before a sight dazzled and giddy, until the motionless man, catching in his breath, with fixed gaze, beholds the universe vanishing like a smoke beyond the universal and void Being into which he aspires to be absorbed. To this end a voyage to India would be the best instructor; or for want of better, the accounts of travelers, books of geography, botany, ethnology, will serve their turn. In each case the search must be the same. A language, a legislation, a catechism, is never more than an abstract thing: the complete thing is the man who acts, the man corporeal and visible, who eats, walks, fights, labors. Leave on one side the theory and the mechanism of constitutions, religions and their systems, and try to see men in their workshops, in their offices, in their fields, with their sky and earth, their houses, their dress, cultivations, meals, as you do when, landing in England or Italy, you remark faces and motions, roads and inns, a citizen taking his walk, a workman drinking. Our great care should be to supply as much as possible the want of present, personal, direct, and sensible observation which we can no longer practice; for it is the only means of knowing men. Let us make the past present: in order to judge of a thing, it must be before us; there is no experience in respect of what is absent. Doubtless this reconstruction is always incomplete; it can produce only incomplete judgments; but to that we must resign ourselves. It is better to have an imperfect knowledge than a futile or false one; and there is no other means of acquainting ourselves approximately with the events of other days, than to *see* approximately the men of other days.

This is the first step in history: it was made in Europe at the new birth of imagination, toward the close of the last century, by Lessing, Walter Scott; a little later in France, by Chateaubriand, Augustin Thierry, Michelet, and others.[5] And now for the second step.

II

When you consider with your eyes the visible man, what do you look for? The man invisible. The words which enter your ears, the gestures, the motions of his head, the clothes he wears, visible acts and deeds of every kind, are expressions merely; somewhat is revealed beneath them, and that is a soul. An inner man is concealed beneath the outer man; the second does but reveal the first. You look at his house, furniture, dress; and that in order to discover in them the marks of his habits and tastes, the degree of his refinement or rusticity, his extravagance or his economy, his stupidity or his cunning. You listen to his conversation, and you note the inflections of his voice, the changes in his attitudes; and that in order to judge of his intensity, his self-forgetfulness or his gaiety, his energy or his constraint. You consider his writings, his artistic productions, his business transactions or political ventures; and that in order to measure the scope and limits of his intelligence, his inventiveness, his coolness, to find out the order, the description, the general force of his ideas, the mode in which he thinks and resolves. All these externals are but avenues converging to a center; you enter them simply in order to reach that center; and that center is the genuine man. I mean that mass of faculties and feelings which are produced by the inner man. We have reached a new world, which is infinite, because every action which we see involves an infinite association of reasonings, emotions, sensations new and old, which have served to bring it to light, and which, like great rocks deep-seated in the ground, find in it their end and their level. This underworld is a new subject matter, proper to the historian. If his critical education suffice, he can lay bare, under every detail of architecture, every stroke in a picture, every phrase in a writing, the special sensation whence detail, stroke, or phrase had issue; he is present at the drama which was enacted in the soul of artist or writer; the choice of a word, the brevity or length of a sentence, the nature of a metaphor, the accent of a verse, the development of an argument—everything is a symbol to him; while his eyes read the text, his soul and mind pursue the continuous development and the ever changing succession of the emotions and conceptions out of which the text has sprung: in short, he unveils a psychology. If you would observe this operation, consider the originator and model of contemporary culture, Goethe, who, before writing *Iphigenia,*[6] employed day after day in designing the most finished statues, and who at last, his eyes filled with the noble forms of ancient scenery, his mind penetrated by the harmonious loveliness of antique life, succeeded in reproducing so exactly in himself the peculiarities of the Greek imagination, that he gives us almost the twin sister of the *Antigone* of Sophocles, and the goddesses of Phidias.[7] This precise and proved interpretation of past sensations has given to history, in our days, a second birth; hardly anything of the sort was known to the preceding century. They thought men of every race and century were all but identical; the Greek, the barbarian, the Hindu, the man of the Restoration, and the man of the eighteenth century, as if they had been turned out of a common mold; and all in conformity to a certain abstract conception, which served for the whole human race. They knew man, but not men; they had not penetrated to the soul; they had not seen the infinite diversity and marvelous complexity of souls; they did not know that the moral constitution of a people or an age is as particular and distinct as the physical structure of a family of plants or an order of animals. Nowadays, history, like zoology, has found its anatomy; and whatever the branch of history to which you devote yourself, philology, linguistic lore, mythology, it is by these means you must strive to produce new fruit. Amid so many writers who, since the time of Herder, Otfried Müller,[8] and Goethe, have continued and still improve this great method, let the reader consider only two historians and two works, Carlyle's *Cromwell,* and Sainte-Beuve's *Port Royal:*[9] he will see with what justice, exactness, depth of insight, one may discover a soul beneath its actions and its works; how behind the old general in place of a vulgar, hypocritical schemer, we recover a man travailing with the troubling reveries of a melancholic imagination, but with definite instincts and faculties, English to the core, strange and incomprehensible to one who has not studies the climate and the race; how, with about a hundred meager letters and a score of mutilated speeches, one may follow him from his farm and team, to the general's tent and to the Protector's[10] throne, in his transmutation and development, in his pricks of conscience and his political conclusions, until the machinery of his mind and actions becomes visible, and the inner tragedy, ever changing and renewed, which exercised this great, darkling soul, passes, like one of Shakespeare's, through the soul of the looker on. He will see (in the other case) how, behind the squabbles of the monastery, or the contumacies of nuns, one may find a great province of human psychology; how about fifty characters, that had been buried under the uniformity of a circumspect narrative, reappear in the light of day, each with its own specialty and its countless diversities; how, beneath theological disquisitions and monotonous sermons, one can unearth the beatings of ever living hearts, the convulsions and apathies of monastic life, the unforeseen reassertions and wavy turmoil of nature, the inroads of surrounding worldliness, the intermittent victories of grace, with such a variety of overcloudings, that the most exhaustive description and the most elastic style can hardly gather the inexhaustible harvest, which the critic has caused to spring up on this abandoned field. And so it is throughout. Germany, with its genius so pliant, so liberal, so apt for transformation, so well calculated to reproduce the most remote and anomalous conditions of human thought; England, with its intellect so precise, so well calculated to grapple closely with moral questions, to render them exact by figures, weights and measures, geography, statistics, by quotation and by common sense; France, with her Parisian culture, with her drawing room manners, with her untiring analysis of characters and actions, her irony so ready to hit upon a weakness, her finesse so practiced in the discrimination of shades of thought—all have worked the same soil, and one begins to understand that there is no region of history where it is not imperative to till this deep level, if one would see a serviveable harvest rise between the furrows.

---

[4] Louis de Rouvroy, Duke de Saint-Simon (1675–1755), French courtier and memoirist; Nicolas Perelle, seventeenth-century French painter; Honoré de Balzac (1799–1850), French novelist; Éugene Lami (nineteenth-century stage designer).

[5] Lessing (above, page 378); Scott (1771–1832), Scottish novelist; François René, Viscount de Chateaubriand (1768–1848), French writer; Augustin Thierry (1795–1856), French historian; Jules Michelet (1798–1874), French historian.

---

[6] Johann Wolfgang von Goethe (1749–1832), *Iphigenie auf Tauris* (1787).

[7] Sophocles (c. 496–406 B.C.), Greek tragic dramatist; Phidias (c. 500–c. 432 B.C.), Greek sculptor.

[8] Johann Gottfried von Herder (1744–1803), German philosopher and critic; Karl Otfried Müller (1797–1840), German archaeologist.

[9] Thomas Carlyle (1795–1881), English writer; Charles Augustin Sainte-Beuve (1804–1869), French critic.

[10] Oliver Cromwell (1599–1658) ruled England from 1649 to 1658, as Lord Protector from 1653.

This is the second step; we are in a fair way to its completion. It is the proper work of the contemporary critic. No one has done it so justly and grandly as Sainte-Beuve; in this respect we are all his pupils; his method renews, in our days, in books, and even in newspapers, every kind of literary, of philosophical and religious criticism. From it we must set out in order to begin the further development. I have more than once endeavored to indicate this development; there is here, in my mind, a new path open to history, and I will try to describe it more in detail.

III

When you have observed and noted in man one, two, three, then a multitude of sensations, does this suffice, or does your knowledge appear complete? Is a book of observations a psychology? It is no psychology, and here as elsewhere the search for causes must come after the collection of facts. No matter if the facts be physical or moral, they all have their causes; there is a cause for ambition, for courage, for truth, as there is for digestion, for muscular movement, for animal heat. Vice and virtue are products, like vitriol and sugar; and every complex phenomenon has its springs from other more simple phenomena on which it hangs. Let us then seek the simple phenomena for moral qualities, as we seek them for physical qualities; and let us take the first fact that presents itself: for example, religious music, that of a Protestant church. There is an inner cause which has turned the spirit of the faithful toward these grave and monotonous melodies, a cause broader than its effect; I mean the general idea of the true, external worship which man owes to God. It is this which has modeled the architecture of the temple, thrown down the statues, removed the pictures, destroyed the ornaments, curtailed the ceremonies, shut up the worshipers in high pews, which prevent them from seeing anything, and regulated the thousand details of decoration, posture, and the general surroundings. This itself comes from another more general cause, the idea of human conduct in all its comprehensiveness, internal and external, prayers, actions, dispositions of every kind by which man is kept face to face with God; it is this which has enthroned doctrine and grace, lowered the clergy, transformed the sacraments, suppressed various practices, and changed religion from a discipline to a morality. This second idea in its turn depends upon a third still more general, that of moral perfection, such as is met with in the perfect God, the unerring judge, the stern watcher of souls, before whom every soul is sinful, worthy of punishment, incapable of virtue or salvation, except by the crisis of conscience which He provokes, and the renewal of heart which He produces. That is the master idea, which consists in erecting duty into an absolute king of human life, and in prostrating all ideal models before a moral model. Here we track the root of man; for to explain this conception it is necessary to consider race itself, that is, the German, the Northman, the structure of his character and intelligence, his general processes of thought and feeling, the sluggishness and coldness of sensation which prevent his falling easily and headlong under the sway of pleasure, the bluntness of his taste, the irregularity and revolutions of his conception, which arrest in him the birth of fair dispositions and harmonious forms, the disdain of appearances, the desire of truth, the attachment to bare and abstract ideas, which develop in him conscience, at the expense of all else. There the search is at an end; we have arrived at a primitive disposition, at a trait proper to all sensations, to all the conceptions of a century or a race, at a particularity inseparable from all the motions of his intellect and his heart. Here lie the grand causes, for they are the universal and permanent causes, present at every moment and in every case, everywhere and always acting, indestructible, and in the end infallibly supreme, since the accidents which thwart them, being limited and partial, end by yielding to the dull and incessant repetition of their force; in such a manner that the general structure of things, and the grand features of events, are their work; and religions, philosophies, poetries, industries, the framework of society and of families, are in fact only the imprints stamped by their seal.

IV

There is then a system in human sentiments and ideas; and this system has for its motive power certain general traits, certain marks of the intellect and the heart common to men of one race, age, or country. As in mineralogy the crystals, however diverse, spring from certain simply physical forms, so in history, civilizations, however diverse, are derived from certain simple spiritual forms. The one are explained by a primitive geometrical element, as the others are by a primitive psychological element. In order to master the classification of mineralogical systems, we must first consider a regular and general solid, its sides and angles, and observe in this the numberless transformations of which it is capable. So, if you would realize the system of historical varieties, consider first a human soul generally, with its two or three fundamental faculties, and in this compendium you will perceive the principal forms which it can present. After all, this kind of ideal picture, geometrical as well as psychological, is hardly complex, and one speedily sees the limits of the outline in which civilizations, like crystals, are constrained to exist.

What do we find, at first sight, in man? Images or representations of things, something, that is, which floats within him, exists for a time, is effaced, and returns again, after he has been looking upon a tree, an animal, any sensible object. This is the subject matter, the development whereof is double, either speculative or practical, according as the representations resolve themselves into a general conception or an active resolution. Here we have the whole of man in an abridgment; and in this limited circle human diversities meet, sometimes in the womb of the primordial matter, sometimes in the twofold primordial development. However minute in their elements, they are enormous in the aggregate, and the least alteration in the factors produces vast alteration in the results. According as the representation is clear and as it were cut out by machinery or confused and faintly defined, according as it embraces a great or small number of the marks of the object, according as it is violent and accompanied by impulses, or quiet and surrounded by calm, all the operations and processes of the human machine are transformed. So, again, according as the ulterior development of the representation varies, the whole human development varies. If the general conception in which it results is a mere dry notation (in Chinese fashion), language becomes a sort of algebra, religion and poetry dwindle, philosophy is reduced to a kind of moral and practical common sense, science to a collection of formulas, classifications, utilitarian mnemonics, and the whole intellect takes a positive bent. If, on the contrary, the general representation in which the conception results is a poetical and figurative creation, a living symbol, as among the Aryan races, language becomes a sort of cloudy and colored word-stage, in which every word is a person, poetry and religion assume a magnificent and inextinguishable grandeur, metaphysics are widely and subtly developed, without regard to positive applications; the whole intellect, in spite of the inevitable deviations and shortcomings of its effort, is smitten with the beautiful and the sublime, and conceives an ideal capable by its nobleness and its harmony of rallying round it the tenderness and enthusiasm of the human race. If, again, the general conception in which the representation results is poetical but not precise; if man arrives at it not by a continuous process, but by a quick intuition; if the original operation is not a regular development, but a violent explosion—then, as with the Semitic races, metaphysics are absent, religion conceives God only as a king solitary and devouring, science cannot grow, the intellect is too rigid and complete to reproduce the delicate operations of nature, poetry can give birth only to vehement and grandiose exclamations, language cannot unfold the web of argument and of eloquence, man is reduced to a lyric enthusiasm, an unchecked passion, a fanatical and constrained action. In this interval between the particular representation and the universal conception are found the germs of the greatest human differences. Some races, as the classical, pass from the first to the second by a graduated scale of ideas, regularly arranged, and general by degrees; others, as the Germanic, traverse the same ground by leaps, without uniformity, after vague and prolonged groping. Some, like the Romans and English, halt at the first steps; others, like the Hindus and Germans, mount to the last. If, again, after considering the passage from the representation to the idea, we consider that from the representation to the resolution, we find elementary differences of the like importance and the like order, according as the impression is sharp, as in southern climates, or dull, as in northern; according as it results in instant action, as among barbarians, or slowly, as in civilized nations; as it is capable or not of growth, inequality, persistence, and connections. The whole network of human passions, the chances of peace and public security, the sources of toil and action, spring from hence. Other primordial differences there are: their issues embrace an entire civilization; and we may compare them to those algebraical formulas which, in a narrow limit, contain in advance the whole curve of which they form the law. Not that this law is always developed to its issue; there are perturbing forces; but when it is so, it is not that the law was false, but that its action was impeded. New elements become mingled with the old; great forces from without counteract the primitive. The race emigrates, like the Aryan, and the change of climate has altered in its case the whole economy, intelligence, and organization of society. The people has been conquered, like the Saxon nation, and a new political structure has imposed on its customs, capacities, and inclinations which it had not. The nation has installed itself in the midst of a conquered people, downtrodden and threatening, like the ancient Spartans; and the necessity of living like troops in the field has violently distorted in an unique direction the whole moral and social constitution. In each case, the mechanism of human history is the same. One continually finds, as the original mainspring, some very general disposition of mind and soul, innate and appended by nature to the race, or acquired and produced by some circumstance acting upon the race. These mainsprings, once admitted, produce their effect gradually: I mean that after some centuries they bring the nation into a new condition, religious, literary, social, economic; a new condition which, combined with their renewed effort, produces another condition, sometimes good, sometimes bad, sometimes slowly, sometimes quickly, and so forth; so that we may regard the whole progress of each distinct civilization as the effect of a permanent force which, at every stage, varies its operation by modifying the circumstances of its action.

V

Three different sources contribute to produce this elementary moral state—the race, the surroundings, and the epoch. What we call the *race* are the innate and hereditary dispositions which man brings with him to the light, and which, as a rule, are united with the marked differences in the temperament and structure of the body. They vary with various peoples. There is a natural variety of men, as of oxen and horses, some brave and intelligent, some timid and dependent, some capable of superior conceptions and creations, some reduced to rudimentary ideas and inventions, some more specially fitted to special works, and gifted more richly with particular instincts, as we meet with species of dogs better favored than others—these for hunting, these for fighting, these for the chase, these again for house dogs or shepherds' dogs. We have here a distinct force—so distinct, that amidst the vast deviations which the other two motive forces produce in him, one can recognize it still; and a race, like the old Aryans, scattered from the Ganges as far as the Hebrides, settled in every clime, spread over every grade of civilization, transformed by thirty centuries of revolutions, nevertheless manifests in its tongues, religions, literatures, philosophies, the community of blood and of intellect which to this day binds its offshoots together. Different as they are, their parentage is not obliterated; barbarism, culture and grafting, differences of sky and soil, fortunes good and bad, have labored in vain: the great marks of the original model have remained, and we find again the two or three principal lineaments of the primitive imprint underneath the secondary imprints which time has stamped above them. There is nothing astonishing in this extraordinary tenacity. Although the vastness of the distance lets us but half perceive—and by a doubtful light—the origin of species,[11] the events of history sufficiently illumine the events anterior to history, to explain the almost immovable steadfastness of the primordial marks. When we meet with them, fifteen, twenty, thirty centuries before our era, in an Aryan, an Egyptian, a Chinese, they represent the work of several myriads of centuries. For as soon as an animal begins to exist, it has to reconcile itself with its surroundings; it breathes after a new fashion, renews itself, is differently affected according to the new changes in air, food, temperature. Different climate and situation bring it various needs, and consequently a different course of actions; and this, again, a different set of habits; and still again, a different set of aptitudes and instincts. Man, forced to accommodate himself to circumstances, contracts a temperament and a character corresponding to them; and his character, like his temperament, is so much more stable, as the external impression is made upon him by more numerous repetitions, and is transmitted to his progeny by a more ancient descent. So that at any moment we may consider the character of a people as an abridgment of all its preceding actions and sensations; that is, as a quantity and as a weight, not infinite,[12] since everything in nature is finite, but disproportioned to the rest, and almost impossible to lift, since every moment of an almost infinite past has contributed to increase it, and because, in order to raise the scale, one must place in the opposite scale a still greater number of actions and sensations. Such is the first and richest source of these master faculties from which historical events take their rise; and one sees at the outset, that if it be powerful, it is because this is no simple spring, but a kind of lake, a deep reservoir wherein other springs have, for a multitude of centuries, discharged their several streams.

Having thus outlined the interior structure of a race, we must consider the surroundings in which it exists. For man is not alone in the world: nature surrounds him, and his fellow men surround him; accidental and secondary tendencies come to place themselves on his primitive tendencies, and physical or social circumstances disturb or confirm the character committed to their charge. In course of time the climate has had its effect. Though we can follow but obscurely the Aryan peoples from their common fatherland to their final countries, we can yet assert that the profound differences which are manifest between the German races on the one side, and the Greek and Latin on the other arise for the most part from the difference between the countries in which they are settled: some in cold moist lands, deep in black marshy forests or on the shores of a wild ocean, caged in by melancholy or violent sensations, prone to drunkenness and gluttony, bent on a fighting, blood-spilling life; others, again, within a lovely landscape, on a bright and laughing seacoast, enticed to navigation and commerce, exempt from gross cravings of the stomach, inclined from the beginning to social ways, to a settled organization of the state, to feelings and dispositions such as develop the art of oratory, the talent for enjoyment, the inventions of science, letters, arts. Sometimes the state policy has been at work, as in the two Italian civilizations: the first wholly turned to action, conquest, government, legislation, by the original site of its city of refuge, by its borderland emporium, by an armed aristocracy, who, by inviting and drilling the strangers and the conquered, presently set face to face two hostile armies, having no escape from its internal discords and its greedy instincts but in systematic warfare; the other, shut out from unity and any great political ambition by the stability of its municipal character, the cosmopolitan condition of its pope, and the military intervention of neighboring nations, directed the whole of its magnificent, harmonious bent towards the worship of pleasure and beauty. Sometimes the social conditions have impressed their mark, as eighteen centuries ago by Christianity, and twenty-five centuries ago by Buddhism, when around the Mediterranean, as in Hindustan, the extreme results of Aryan conquest and civilization induced an intolerable oppression, the subjugation of the individual, utter despair, a curse upon the world, with the development of metaphysics and myth, so that man in this dungeon of misery, feeling his heart softened, begot the idea of abnegation, charity, tender love, gentleness, humility, brotherly love—there, in a notion of universal nothingness, here under the fatherhood of God. Look around you upon the regulating instincts and faculties implanted in a race—in short, the mood of intelligence in which it thinks and acts at the present time: you will discover most often the work of some one of these prolonged situations, these surrounding circumstances, persistent and gigantic pressures, brought to bear upon an aggregation of men who, singly and together, from generation to generation, are continually molded and modeled by their action; in Spain, an eight-century crusade against the Mussulmans, protracted even beyond and until the exhaustion of the nation by the expulsion of the Moors, the spoliation of the Jews, the establishment of the Inquisition, the Catholic wars; in England, a political establishment of eight centuries, which keeps a man erect and respectful, in independence and obedience, and accustoms him to strive unitedly, under the authority of the law; in France, a Latin organization, which, imposed first upon docile barbarians, then shattered in the universal crash, is reformed from within under a lurking conspiracy of the national instinct, is developed under hereditary kings, ends in a sort of egality republic, centralized, administrative, under dynasties exposed to revolution. These are the most efficacious of the visible causes which mold the primitive man: they are to nations what education, career, condition, abode, are to individuals; and they seem to comprehend everything, since they comprehend all external powers which shape human matter, and by which the external acts on the internal.

[11] [Taine] Darwin, *The Origin of Species.* Prosper Lucas, *De l'hérédité [On Heredity].*

[12] [Taine] Spinoza, *Ethics,* Part IV. Axiom.

There is yet a third rank of causes; for, with the forces within and without, there is the work which they have already produced together, and this work itself contributes to produce that which follows. Beside the permanent impulse and the given surroundings, there is the acquired momentum. When the national character and surrounding circumstances operate, it is not upon a *tabula rasa,*[13] but on a ground on which marks are already impressed. According as one takes the ground at one moment or another, the imprint is different; and this is the cause that the total effect is different. Consider, for instance, two epochs of a literature or an art—French tragedy under Corneille and under Voltaire, the Greek drama under Aeschylus and under Euripides, Italian painting under da Vinci and under Guido.[14] Truly, at either of these two extreme points the general idea has not changed; it is always the same human type which is its subject of representation or painting; the mold of verse, the structure of the drama, the form of body has endured. But among several differences there is this, that the one artist is the precursor, the other the successor; the first has no model, the second has; the first sees objects face to face, the second sees them through the first; that many great branches of art are lost, many details are perfected, that simplicity and grandeur of impression have diminished, pleasing and refined forms have increased—in short, that the first work has outlived the second. So it is with a people as with a plant; the same sap, under the same temperature, and in the same soil, produces, at different steps of its progressive development, different formations, buds, flowers, fruits, seed vessels, in such a manner that the one which follows has always the first for its condition, and grows from its death. And if now you consider no longer a brief epoch, as our own time, but one of those wide intervals which embrace one or more centuries, like the Middle Ages, or our last classic age, the conclusion will be similar. A certain dominant ideas has had sway; men, for two, for five hundred years, have taken to themselves a certain ideal model of man: in the Middle Ages, the knight and the monk; in our classic age, the courtier, the man who speaks well. This creative and universal idea is displayed over the whole field of action and thought; and after covering the world with its works, involuntarily systematic, it has faded, it has died away, and lo, a new idea springs up, destined to a like domination, and the like number of creations. And here remember that the second depends in part upon the first, and that the first, uniting its effect with those of national genius and surrounding circumstances, imposes on each new creation its bent and direction. The great historical currents are formed after this law—the long dominations of one intellectual pattern, or a master idea, such as the period of spontaneous creations called the Renaissance, or the period of oratorical models called the Classical Age, or the series of mystical compositions called the Alexandrian and Christian eras, or the series of mythological efflorescences which we meet with in the infancy of the German people, of the Indian and the Greek. Here as elsewhere we have but a mechanical problem; the total effect is a result, depending entirely on the magnitude and direction of the producing causes. The only difference which separates these moral problems from physical ones is that the magnitude and direction cannot be valued or computed in the first as in the second. If a need or a faculty is a quantity, capable of degrees, like a pressure or a weight, this quantity is not measurable like the pressure or the weight. We cannot define it in an exact or approximative formula; we cannot have more, or give more, in respect of it, than a literary impression; we are limited to marking and quoting the salient points by which it is manifested, and which indicate approximately and roughly the part of the scale which is its position. But though the means of notation are not the same in the moral and physical sciences, yet as in both the matter is the same, equally made up of forces, magnitudes, and directions, we may say that in both the final result is produced after the same method. It is great or small, as the fundamental forces are great or small and act more or less exactly in the same sense, according as the distinct effects of race, circumstance, and epoch combine to add the one to the other, or to annul one another. Thus are explained the long impotences and the brilliant triumphs which make their appearance irregularly and without visible cause in the life of a people; they are caused by internal concords or contrarieties. There was such a concord when in the seventeenth century the sociable character and the conversational aptitude, innate in France, encountered the drawing room manners and the epoch of oratorical analysis; when in the nineteenth century the profound and elastic genius of Germany encountered the age of philosophical compositions and of cosmopolitan criticism. There was such a contrariety when in the seventeenth century the rude and lonely English genius tried blunderingly to adopt a novel politeness; when in the sixteenth century the lucid and prosaic French spirit tried vainly to cradle a living poetry. That hidden concord of creative forces produced the finished urbanity and the noble and regular literature under Louis XIV and Bossuet, the grand metaphysics and broad critical sympathy of Hegel and Goethe.[15] That hidden contrariety of creative forces produced the imperfect literature, the scandalous comedy, the abortive drama under Dryden and Wycherley,[16] the vile Greek importations, the groping elaborate efforts, the scant half-graces under Ronsard and the Pleiad.[17] So much we can say with confidence, that the unknown creations towards which the current of the centuries conducts us, will be raised up and regulated altogether by the three primordial forces; that if these forces could be measured and computed, one might deduce from them as from a formula the specialties of future civilization; and that if, in spite of the evident crudeness of our notations, and the fundamental inexactness of our measures, we try now to form some idea of our general destiny, it is upon an examination of these forces that we must ground our prophecy. For in enumerating them, we traverse the complete circle of the agencies; and when we have considered race, circumstance, and epoch, which are the internal mainsprings, the external pressure, and the acquired momentum, we have exhausted not only the whole of the actual cause, but also the whole of the possible causes of motive.

[14] Corneille (above, page 244); François Marie Arouet de Voltaire (1694–1778), French philosopher; Aeschylus (525–456 B.C.) and Euripides (c. 485–406 B.C.), Greek tragic dramatists; Leonardo da Vinci (1452–1519), Italian artist and scientist; Guido Reni (1575–1642), Italian painter and engraver.

VI

It remains for us to examine how these causes, when applied to a nation or an age, produce their results. As a rivulet falling from a height spreads its streams, according to the depth of the descent, stage after stage, until it reaches the lowest level of the soil, so the disposition of intellect or soul impressed on a people by race, circumstance, or epoch, spreads in different proportions and by regular descents, down the diverse orders of facts which make up its civilization.[18] If we arrange the map of a country, starting from the watershed, we find that below this common point the streams are divided into five or six principal basins, then each of these into several secondary basins, and so on, until the whole country with its thousand details is included in the ramifications of this network. So, if we arrange the psychological map of the events and sensations of a human civilization, we find first of all five or six well-defined provinces—religion, art, philosophy, the state, the family, the industries; then in each of these provinces natural departments; and in each of these, smaller territories, until we arrive at the numberless details of life such as may be observed within and around us every day. If now we examine and compare these diverse groups of facts, we find first of all that they are made up of parts, and that all have parts in common. Let us take first the three chief works of human intelligence—religion, art, philosophy. What is a philosophy but a conception of nature and its primordial causes, under the form of abstractions and formularies? What is there at the bottom of a religion or of an art but a conception of this same nature and of these same causes, under form of symbols more or less concise, and personages more or less marked; with this difference, that in the first we believe that they exist, in the second we believe that they do not exist? Let the reader consider a few of the great creations of the intelligence in India, Scandinavia, Persia, Rome, Greece, and he will see that, throughout, art is a kind of philosophy made sensible, religion a poem taken for true, philosophy an art and a religion dried up, and reduced to simple ideas. There is therefore, at the core of each of these three groups, a common element, the conception of the world and its principles; and if they differ among themselves, it is because each combines with the common, a distinct element: now the power of abstraction, again the power to personify and to believe, and finally the power to personify and not believe. Let us now take the two chief works of human association, the family and the state. What forms the state but a sentiment of obedience, by which the many unite under the authority of a chief? And what forms the family but the sentiment of obedience, by which wife and children act under the direction of a father and husband? The family is a natural state, primitive and restrained, as the state is an artificial family, ulterior and expanded; and amongst the differences arising from the number, origin, and condition of its members, we discover in the small society as in the great, a like disposition of the fundamental intelligence which assimilates and unites them. Now suppose that this element receives from circumstance, race, or epoch certain special marks, it is clear that all the groups into which it enters, will be modified proportionately. If the sentiment of obedience is merely fear,[19] you will find, as in most Oriental states, a brutal despotism, exaggerated punishment, oppression of the subject, servility of manners, insecurity of property, an impoverished production, the slavery of women, and the customs of the harem. If the sentiment of obedience has its root in the instinct of order, sociality, and honor, you will find, as in France, a perfect military organization, a fine administrative hierarchy, a want of public spirit with occasional jerks of patriotism, ready docility of the subject with a revolutionary impatience, the cringing courtier with the counter-efforts of the genuine man, the refined sympathy between conversation and society on the one hand, and the worry at the fireside and among the family on the other, the equality of the married with the incompleteness of the married state, under the necessary constraint of the law. If, again, the sentiment of obedience has its root in the instinct of subordination and the idea of duty, you will find, as among the Germans, security and happiness in the household, a solid basis of domestic life, a tardy and incomplete development of society, an innate respect for established dignities, a superstitious reverence for the past, the keeping up of social inequalities, natural and habitual regard for the law. So in a race, according as the aptitude for general ideas varies, religion, art, and philosophy vary. If man is naturally inclined to the widest universal conceptions, and apt to disturb them at the same time by the nervous delicacy of his oversensitive organization, you will find, as in India, an astonishing abundance of gigantic religious creations, a glowing outgrowth of vast and transparent epic poems, a strange tangle of subtle and imaginative philosophies, all so well interwoven, and so penetrated with a common essence, as to be instantly recognized, by their breadth, their coloring, and their want of order, as the products of the same climate and the same intelligence. If, on the other hand, a man naturally staid and balanced in mind limits of his own accord the scope of his ideas, in order the better to define their form, you will find, as in Greece, a theology of artists and tale-tellers; distinctive gods, soon considered distinct from things, and transformed, almost at the outset, into recognized personages; the sentiment of universal unity all but effaced, and barely preserved in the vague notion of destiny; a philosophy rather close and delicate than grand and systematic, confined to a lofty metaphysics,[20] but incomparable for logic, sophistry, and morals; poetry and arts superior for clearness, spirit, scope, truth, and beauty to all that have ever been known. If, once more, man, reduced to narrow conceptions, and deprived of all speculative refinement, is at the same time altogether absorbed and straitened by practical occupations, you will find, as in Rome, rudimentary deities, mere hollow names, serving to designate the trivial details of agriculture, generation, household concerns, etiqueties in fact of marriage, of the farm, producing a mythology, a philosophy, a poetry, either worth nothing or borrowed. Here, as elsewhere, the law of mutual dependence[21] comes into play. A civilization forms a body, and its parts are connected with each other like the parts of an organic body. As in an animal, instincts, teeth, limbs, osseous structure, muscular envelope, are mutually connected, so that a change in one produces a corresponding change in the rest, and a clever naturalist can by a process of reasoning reconstruct out of a few fragments almost the whole body; even so in a civilization, religion, philosophy, the organization of the family, literature, the arts, make up a system in which every local change induces a general change, so that an experienced historian, studying some particular part of it, sees in advance and half predicts the character of the rest. There is nothing vague in this interdependence. In the living body the regulator is, first, its tendency to manifest a certain primary type; then its necessity for organs whereby to satisfy its wants, and for harmony with itself in order that it may live. In a civilization, the regulator is the presence, in every great human creation, of a productive element, present also in other surrounding creations—to wit, some faculty, aptitude, disposition, effective and discernible, which, being possessed of its proper character, introduces it into all the operations in which it assists, and, according to its variations, causes all the works in which it cooperates to vary also.

[19] [Taine] Montesquieu, *Esprit des lois, principes des trois gouvernments [The Spirit of Laws]*.

VII

At this point we can obtain a glimpse of the principal features of human transformations, and begin to search for the general laws which regulate, not events only, but classes of events, not such and such religion or literature, but a group of literatures or religions. If, for instance, it were admitted that a religion is a metaphysical poem, accompanied by a belief; and remarking at the same time that there are certain epochs, races, and circumstances in which belief, the poetical and metaphysical faculty, are combined with an unwanted vigor; if we consider that Christianity and Buddhism were produced at periods of grand productions, and amid such miseries as raised up the fanatics of the Cévennes; if we recognize, on the other hand, that primitive religions are born at the awakening of human reason, during the richest blossoming of human imagination, at a time of the fairest artlessness and the greatest credulity; if we consider, also, that Mohammedanism appeared with the dawning of poetic prose, and the conception of national unity, amongst a people destitute of science, at a period of sudden development of the intellect, we might then conclude that a religion is born, declines, is reformed and transformed according as circumstances confirm and combine with more or less exactitude and force its three generative instincts; and we should understand why it is endemic in India, amidst imaginative, philosophic, eminently fanatic brains; why it blossomed forth so strangely and grandly in the Middle Ages, amidst an oppressive organization, new tongues and literatures; why it was aroused in the sixteenth century with a new character and heroic enthusiasm, amid universal regeneration, and during the awakening of the German races; why it breaks out into eccentric sects amid the rude American democracy, and under the bureaucratic Russian despotism; why, in fine, it is spread, at the present day, over Europe in such different dimensions and such various characteristics, according to the differences of race and civilization. And so for every kind of human production—for literature, music, the fine arts, philosophy, science, statecraft, industries, and the rest. Each of these has for its direct cause a moral disposition, or a combination of moral dispositions: the cause given, they appear; the cause withdrawn, they vanish: the weakness or intensity of the cause measures their weakness or intensity. They are bound up with their causes, as a physical phenomenon with its condition, as the dew with the fall of the variable temperature, as dilatation with heat. There are such dualities in the moral as in the physical world, as rigorously bound together, and as universally extended in the one as in the other. Whatever in the one case produces, alters, suppresses the first term, produces, alters, suppresses the second as a necessary consequence. Whatever lowers the temperature, deposits the dew. Whatever develops credulity side by side with poetical thoughts, engenders religion. Thus phenomena have been produced; thus they will be produced. As soon as we know the sufficient and necessary condition of one of these vast occurrences, our understanding grasps the future as well as the past. We can say with confidence in what circumstances it will reappear, foresee without rashness many portions of its future history, and sketch with care some features of its ulterior development.

---

[20] [Taine] The Alexandrian philosophy had its birth from the West. The metaphysical notions of Aristotle are isolated; moreover, with him as with Plato, they are but a sketch. By way of contrast consider the systematic vigor of Plotinus, Proclus, Schelling, and Hegel, or the admirable boldness of Brahminica and Buddhist speculation.

[21] [Taine] I have endeavored on several occasions to give expression to this law notably in the Preface to *Essais de critique et d'histoire [Critical and Historical Essays].*

VIII

History is now upon, or perhaps almost upon this footing, that it must proceed after such a method of research. The question propounded nowadays is of this kind. Given a literature, philosophy, society, art, group of arts, what is the moral condition which produced it? What the conditions of race, epoch, circumstance, the most fitted to produce this moral condition? There is a distinct moral condition for each of these formations, and for each of their branches; one for art in general, one for each kind of art—for architecture, painting, sculpture, music, poetry; each has its special germ in the wide field of human psychology; each has its law, and it is by virtue of this law that we see it raised, by chance, as it seems, wholly alone, amid the miscarriage of its neighbors, like painting in Flanders and Holland in the seventeenth century, poetry in England in the sixteenth, music in Germany in the eighteenth. At this moment, and in these countries, the conditions have been fulfilled for one art, not for others, and a single branch has budded in the general barrenness. For these rules of human growth must history search; with the special psychology of each special formation it must occupy itself; the finished picture of these characteristic conditions it must now labor to compose. No task is more delicate or more difficult; Montesquieu[22] tried it, but in his time history was too new to admit of his success; they had not yet even a suspicion of the road necessary to be traveled, and hardly now do we begin to catch sight of it. Just as in its elements astronomy is a mechanical and physiology a chemical problem, so history in its elements is a psychological problem. There is a particular inner system of impressions and operations which makes an artist, a believer, a musician, a painter, a wanderer, a man of society; and of each the affiliation, the depth, the independence of ideas and emotions, are different: each has its moral history and its special structure, with some governing disposition and some dominant feature. To explain each, it would be necessary to write a chapter of esoteric analysis, and barely yet has such a method been rudely sketched. One man alone, Stendhal,[23] with a singular bent of mind and a singular education, has undertaken it, and to this day the majority of readers find his books paradoxical and obscure: his talent and his ideas were premature; his admirable divinations were not understood, any more than his profound sayings thrown out cursorily, or the astonishing justness of his perception and of his logic. It was not perceived that, under the exterior of a conversationalist and a man of the world, he explained the most complicated of esoteric mechanisms; that he laid his finger on the mainsprings; that he introduced into the history of the heart scientific processes, the art of notation, decomposition, deduction; that he first marked the fundamental causes of nationality, climate, temperament; in short, that he treated of sentiments as they should be treated—in the manner of the naturalist, namely, and of the natural philosopher, who constructs classifications and weighs forces. For this very reason he was considered dry and eccentric: he remained solitary, writing novels, voyages, notes, for which he sought and obtained a score of readers. And yet we find in his books at the present day essays the most suitable to open the path which I have endeavored to describe. No one has better taught us how to open our eyes and see, to see first the men that surround us and the life that is present, then the ancient and authentic documents, to read between the black and white lines of the pages, to recognize under the old impression, under the scribbling of a text, the precise sentiment, the movement of ideas, the state of mind in which they were written. In his writings, in Sainte-Beuve, in the German critics, the reader will see all the wealth that may be drawn from a literary work: when the work is rich, and one knows how to interpret it, we find there the psychology of a soul, frequently of an age, now and then of a race. In this light, a great poem, a fine novel, the confessions of a superior man, are more instructive than a heap of historians with their histories. I would give fifty volumes of charters and a hundred volumes of state papers for the memoirs of Cellini, the epistles of St. Paul, the table-talk of Luther, or the comedies of Aristophanes.[24] In this consists the importance of literary works: they are instructive because they are beautiful; their utility grows with their perfection; and if they furnish documents, it is because they are monuments. The more a book represents visible sentiments, the more it is a work of literature; for the proper office of literature is to take note of sentiments. The more a book represents important sentiments, the higher is its place in literature; for it is by representing the mode of being of a whole nation and a whole age, that a writer rallies round him the sympathies of an entire age and an entire nation. This is why, amid the writings which set before our eyes the sentiments of preceding generations, a literature, and notably a grand literature, is incomparably the best. It resembles that admirable apparatus of extraordinary sensibility, by which physicians disentangle and measure the most recondite and delicate changes of a body. Constitutions, religions, do not approach it in importance; the articles of a code and of a catechism only show us the spirit roughly and without delicacy. If there are any writings in which politics and dogma are full of life, it is in the eloquent discourses of the pulpit and the tribune, memoirs, unrestrained confessions; and all this belongs to literature: so that, in addition to itself, it has all the advantage of other works. It is then chiefly by the study of literatures that one may construct a moral history, and advance toward the knowledge of psychological laws, from which events spring.

---

[22] Charles Louis de Secondat, Baron de la Brède Montesquieu (1689–1755), French political philosopher.

[23] Stendhal (Marie Henri Beyle, 1783–1842), French novelist.

[24] Aristophanes (c. 448–after 388 B.C.), Greek comic dramatist.

I am about to write the history of a literature, and to seek in it for the psychology of a people: if I have chosen this one in particular, it is not without a reason. I had to find a people with a grand and complete literature, and this is rare: there are few nations who have, during their whole existence, really thought and written. Among the ancients, the Latin literature is worth nothing at the outset, then borrowed and imitative. Among the moderns, German literature is almost wanting for two centuries.[25] Italian literature and Spanish literature end at the middle of the seventeenth century. Only ancient Greece, modern France and England, offer a complete series of great significant monuments. I have chosen England, because being yet alive, and subject to direct examination, it may be better studied than a destroyed civilization, of which we retain but the scraps, and because, being different from France, it has in the eyes of a Frenchman a more distinct character. Besides, there is a peculiarity in this civilization, that apart from its spontaneous development, it presents a forced deviation, it has suffered the last and most effectual of all conquests, and that the three grounds whence it has sprung, race, climate, the Norman invasion, may be observed in its remains with perfect exactness; so well, that we may examine in this history the two most powerful moving springs of human transformation, natural bent and constraining force, and we may examine them without uncertainty or gap, in a series of authentic and unmutilated memorials. I have endeavored to define these primary springs, to exhibit their gradual effects, to explain how they have ended by bringing to light great political, religious, and literary works, and by developing the recondite mechanism whereby the Saxon barbarian has been transformed into the Englishman of today.

---

[25] [Taine] From 1550–1750.

Charles Sanders Peirce

1839–1914

Charles Sanders Peirce (pronounced "purse") has long been recognized as one of the principal figures in the history of modern symbolic logic, the first American pragmatist, and the principal originator of semiotics. In all of these capacities, however, Peirce has been a problematic figure, in part because his philosophical position is exceptionally demanding, but also because he did not, in his lifetime, complete a comprehensive book that provides a continuous exposition of his thought. Peirce was an incisive historian of logic and metaphysics and one among the earliest American scientists to receive international recognition. In addition to more than 40,000 pages of published books, articles, reviews, and encyclopedia entries, Peirce left a massive collection of unpublished papers still in the process of being edited and published. Peirce's philosophical work was profoundly shaped early on by his intensive critical study of Kant (above, page 416), which led him to the study of medieval realism, especially the writing of Duns Scotus.

Early scholarship on Peirce was understandably slow to grasp either the centrality of Peirce's concern with logic as semiotic or the scope of the implications he drew from it, particularly in his sustained and sometimes sinuous following out of the links between logical reasoning and metaphysics. As Duns Scotus had recognized, the result of a theory of reality that could not account for what he had termed "formal universals" but assumed that reality was encompassed by such terms as Being and Substance, or Form and Matter, was that we could neither account for our ability to make valid generalizations nor prevent philosophical arguments from hopeless entanglements with paradox. Peirce's approach to this problem, explored in precise detail in the first selection here, "On a New List of Categories," was not to seek out or deduce, following Kant, *a priori* principles that are legislative for our conceptions, but to examine what conceptions were indispensable for making even the simplest predications (as in his example, "The stove is black").

The difficulty that readers frequently have in reading Peirce's philosophical essays (like Kant's critiques) sometimes flows from the very simplicity of what he aims to do—a point that may well recall William Blake's (above, page 447) aphorism concerning the gulf that separates the simple from the insipid. Recognizing that Kant's greatest limitation may well have been the absence of any comprehensive theory of symbolic mediation, Peirce keeps attention strictly focused on the task of discerning how the concepts with which we think depend upon other concepts, without making the assumption that we could intuitively recognize which among our conceptions are primary or primitive. "On a New List of Categories" is both an extension of Kant's deduction of his Categories, a return to Aristotle's (above, page 48) first attempt to formulate categories as predicates, and a brilliant breaking of new ground in both method and result. Peirce's account need not be confusing, so long as one recognizes that Peirce's three categories, later reduced to *First, Second,* and *Third,* provide a way to locate the ground of a conception, the scope of its correlation with other instances, and the mediating representation (or "interpretant") that allows us to acknowledge a dimension of reality that is neither matter nor form but a distinct relation as a mode of reality not reducible to either. The schema Peirce introduces in "On a New List of Categories" also makes it possible, in principle, to accommodate both the infinite extensibility of any signifier without falling into recursive paradoxes and contradictions, while keeping open a pathway back to the primary evidence from which any conception was formed.

This latter point is crucial for Peirce's insistence on thinking of philosophy and logic as the essentially communal and collective work of inquiry. Peirce does not rely upon a traditional and dialectical conception of truth as a putative agreement of a representation with its object (a sure formula to precipitate paradoxes), but locates it in the concrete result of inquiry and argument that resolves doubt and fixes belief. The expectation that such a process would end absolutely entirely misses the point of how reasoning and inquiry both unfold as continuous processes. Historically, Peirce located his own work not simply in relation to his contemporaries, but to the historical problems of nominalism and realism, seeing the emergence of an ethos of scientific inquiry as working against the nominalism prevalent since Descartes, and toward a new critical realism.

The other selections reprinted here include writings on the history of philosophy, originally assembled from manuscript sources by the editors of *Collected Papers,* and selected material drawn from essays and courses of lectures, illustrating his own version of pragmatism, obviously quite distinct from the more familiar work of his friend William James and his one-time student, John Dewey. Indeed, one of the principal difficulties in the general reception of Peirce's thought has been a tendency to identify him with a development of ideas original with him that, in their more popular form, are frequently contrary to his own thought, both in reference to pragmatism and to questions of semiotics, where the sharp differences between Peirce and James and Dewey on the one hand, and between Peirce and Saussure (below, page 786) on the other are frequently overlooked or ignored.[1]

Recognition of Peirce as a major philosophical innovator has been relatively slow, despite the obviousness of his genius, but a growing body of recent work, along with a major project to publish his writings in a chronological edition, discussed below, has contributed to a steady increase of interest in and understanding of his work.

The long standard published collection of Peirce's work in eight volumes, *Collected Papers* (1931–1960), edited by Charles Hartshorne and Paul Weiss, vol. 7–8 edited by A. W. Burks, is gradually being replaced by a more ambitious and professionally edited chronological edition, *The Collected Writings of Charles Sanders*

---

[1] The conflation of Dewey, James, and Peirce as indifferently "pragmatists," ignoring Peirce's deliberate coinage of a term he characterized as "ugly enough to keep it safe from kidnappers" (*Collected Papers* 2.414), *pragmaticism,* is a habit of long standing, reflected, for example, in the work of Richard Rorty and Richard Poirier, just as is the tendency to critique pragmatism for its instrumentalism as if it were a general fault, articulated by Horkheimer, Adorno, and Habermas. On the tendency to minimize the difference between Peirce and Saussure, see especially Paul de Man, "The Resistance to Theory" (below, page 1317) and Jonathan Culler's *The Pursuit of Signs: Semiotics, Literature and Deconstruction* (1981).

Peirce (1982–) edited by Max Frisch, Christian Kloesel, Nathan Houser, and others. An electronic edition of *Collected Papers,* edited by John Deely (with an excellent introduction) was released by Past Masters in 1994. For students working with manuscript materials, Richard Robin's *Annotated Catalogue of the Papers of Charles S. Peirce* (1967), with supplements online, is essential. See also Web sites at the Institute for the Study of Pragmaticism at Texas Tech University, originated by Kenneth Ketner, and especially Joseph Ransdell's "Arisbe" portal. Other editions of particular manuscripts, published as study editions, and specialized collections, have included: Kenneth L. Ketner and James E. Cook, eds., *Charles Sanders Peirce: Contributions to the Nation* (1975); Carolyn Eisele, ed., *The New Elements of Mathematics* (in four volumes, 1976); Charles S. Hartwick, ed., *Semiotics and Significs: The Correspondence Between Charles S. Peirce and Lady Victoria Welby* (1977); Carolyn Eisele, ed., *Historical Perspectives on Peirce's Logic of Science: A History of Science* (1985); James Hoopes, ed., *Peirce on Signs: Writings of Semiotics* (1991); Kenneth L. Ketner, ed., *Reasoning and the Nature of Things: The Cambridge Conference Lectures of 1898* (1992); and Patricia Ann Turrisi, ed., *Pragmatism as a Principle and Method of Right Thinking* (1997). For Peirce studies, anthologies have been especially important and are still useful. Notable is Nathan Houser, Christian Kloesel, et al., eds., *The Essential Peirce* (in two volumes, 1992); Morris R. Cohen, ed., *Chance, Love, and Logic: Philosophical Essays by the Late Charles S. Peirce* (1923; 1992); Justus Buchler, ed., *Philosophical Writings of Peirce* (1955); Editors of the Liberal Arts Press, *Essays in the Philosophy of Science* (1957); and Philip P. Wiener, ed., *Values in a Universe of Change: Selected Writings of Charles Sanders Peirce* (1958). Biographical studies of Peirce include Joseph Brent's *Charles Sanders Peirce* (1998); and Kenneth L. Ketner's unconventional narrative, derived from Peirce's papers, *His Glassy Essence: An Autobiography of Charles Sanders Peirce* (1998). For a brief overview of Peirce, see Leroy F. Searle, "Charles Sanders Peirce" in *The Johns Hopkins Guide to Literary Theory and Criticism* (1994). The scholarly response to Peirce is extensive, though the evolving state of accessible materials is sometimes a liability, particularly in earlier studies by Thomas Goudge (1950), Manley Thompson (1953), and Murray Murphey (1961). Still essential is John F. Boler, *Charles Sanders Peirce and Scholastic Realism: A Study of Peirce's Relation to John Duns Scotus* (1962). Since the publication of Karl-Otto Apel's, *Charles S. Peirce: From Pragmatism to Pragmaticism* (1981), the distinctiveness of Peirce's philosophy has been increasingly apparent. See also Peter Skagestad, *The Road of Inquiry: Charles Peirce's Pragmatic Realism* (1981); Christopher Hookway, *Peirce* (1985); Robert Corrington, *An Introduction to C. S. Peirce* (1993); Kelly Parker, *The Continuity of Peirce's Thought* (1998); Andrew Reynolds, *Peirce's Scientific Metaphysics: The Philosophy of Chance, Law, and Evolution* (2002). Students with an interest in Peirce's graphic system of logic or "existential graphs" should begin with Don D. Roberts's pioneering study, *The Existential Graphs of C. S. Peirce* (1973). See also John Sowa, *Conceptual Structures: Information Processing in Mind and Machine* (1984) and subsequent publications, for an influential adaptation of Peirce for artificial-intelligence applications; Jay Zeeman, "Peirce's Graphs" and Peter Ohrstrom, "C. S. Peirce and the Quest for Gamma Graphs" in Dickson Lukose, et al., eds., *Conceptual Structures: Fulfilling Peirce's Dream* (1997), and Sun-Joo Shin, *The Iconic Logic of Peirce's Graphs* (2002).

On a New List of Categories (1868)

545. This paper is based upon the theory already established,[1] that the function of conceptions is to reduce the manifold of sensuous impressions to unity and that the validity of a conception consists in the impossibility of reducing the content of consciousness to unity without the introduction of it.

546. This theory gives rise to a conception of gradation among those conceptions which are universal. For one such conception may unite the manifold of sense and yet another may be required to unite the conception and the manifold to which it is applied; and so on.

547. That universal conception which is nearest to sense is that of *the present, in general*. This is a conception, because it is universal.[2] But as the act of attention has no connotation at all, but is the pure denotative power of the mind, that is to say, the power which directs the mind to an object, in contradistinction to the power of thinking any predicate of that object—so the conception of *what is present in general,* which is nothing but the general recognition of what is contained in attention, has no connotation, and therefore no proper unity. This conception of the present in general, of IT in general, is rendered in philosophical language by the word "substance" in one of its meanings. Before any comparison or discrimination can be made between what is present, what is present must have been recognized as such, as *it,* and subsequently the metaphysical parts which are recognized by abstraction are attributed to this *it,* but the *it* cannot itself be made a predicate. This *it* is thus neither predicated of a subject, nor in a subject, and accordingly is identical with the conception of substance.[3]

548. The unity to which the understanding reduces impressions is the unity of a proposition. This unity consists in the connection of the predicate with the subject; and, therefore, that which is implied in the copula, or the conception of *being,* is that which completes the work of conceptions of reducing the manifold to unity. The copula (or rather the verb which is copula in one of its senses) means either *actually is* or *would be,* as in the two propositions, "There *is* no griffin," and "A griffin *is* a winged quadruped."[4] The conception of *being* contains only that junction of predicate to subject wherein these two verbs agree. The conception of being, therefore, plainly has no content.

If we say "The stove is black," the stove is the *substance,* from which its blackness has not been differentiated, and the *is,* while it leaves the substance just as it was seen, explains its confusedness, by the application to it of blackness as a predicate.

Though being does not affect the subject, it implies an indefinite determinability of the predicate.[5] For if one could know the copula and predicate of any proposition, as "... is a tailed-man," he would know the predicate to be applicable to something supposable, at least. Accordingly, we have propositions whose subjects are entirely indefinite, as "There is a beautiful ellipse," where the subject is merely *something actual* or *potential;* but we have no propositions whose predicate is entirely indeterminate, for it would be quite senseless to say, "*A* has the common characters of all things," inasmuch as there are no such common characters.

"On a New List of Categories" was first published in *Proceedings of the American Academy of Arts and Sciences* 7 (1867), 287–98, reprinted in *Collected Papers* (Cambridge, Mass.: Harvard University Press, 1931), I, 545–59 and *Writings* 2, 49–59. Paragraph numbers from *Collected Papers* have been retained for convenience of reference.

[1] Peirce refers to Kant's argument in *The Critique of Pure Reason,* Transcendental Analytic, especially Book I, Analytic of Concepts. Peirce's seemingly matter-of-fact statement is in actuality a remarkably concise interpretation of Kant's aim in the deduction of the categories from the table of judgments. The passage in Kant that is closest in sense to Peirce's claim here is Kant's assertion, in distinguishing between sensible intuition dependent upon the presence of its object and concepts dependent upon their function: "By 'function' I mean the unity of the act of bringing various representations under one common representation. Concepts are based on the spontaneity of thought, sensible intuitions on the receptivity of impressions. Now the only use which the understanding can make of these concepts is to judge by means of them. Since no representation, save what is in an intuition, is in immediate relation to an object, no concept is ever related to an object immediately, but to some other representation of it, be that other representation an intuition, or itself a concept. Judgment is therefore the mediate knowledge of an object, that is, the representation of a representation of it. In every judgment there is a concept which holds of many representations, and among them of a given representation that is immediately related to an object." *The Critique of Pure Reason* B 93, p. 105. (Kemp Smith translation).

[2] Here, Peirce goes beyond Kant's analysis by treating the present in general as a concept and not as the effect of the *a priori* unity of the apperception. Peirce evidently recognized that without this move, that there would be no way to distinguish between intuitions and concepts, just as it frees him, among other things, from the necessity of analyzing the problematic notion of the unity of the apperception; without this concept, there could be no specific content of consciousness.

[3] Peirce adopts the language of Arisotle's *Categories,* chapter V: 2a:11–13: "Substance in the truest and strictest, the primary sense of that term, is that which is neither asserted of nor can be found in a subject."

[4] By thus identifying the "is" of *being* with the function of the copula in a proposition, Peirce avoids altogether the problem of empirical content that has, since Parmenides, led philosophers to assert a fundamental difference between the factual and the hypothetical (including the fictional). The issue here is not that one cannot tell the difference, only that it is never in itself a genuine problem. For Peirce, the conception of *being* is only its function of joining subject to predicate. Compare the difference of approach between Peirce here and Bertrand Russell in his theory of descriptions (below, page 812).

[5] That is, if one predicate can be established, others could be, potentially without end. By this formulation, Peirce at once anticipates the process of signification as open-ended without making the error of assuming that an infinite chain of signifiers implies a state of indeterminacy.

Thus substance and being are the beginning and end of all conception. Substance is inapplicable to a predicate, and being is equally so to a subject.[6]

549. The terms "precision"[7] and "abstraction," which were formerly applied to every kind of separation, are now limited, not merely to mental separation, but to that which arises from *attention to* one element and *neglect of* the other. Exclusive attention consists in a definite conception or *supposition* of one part of an object, without any supposition of the other. Abstraction or precision ought to be carefully distinguished from two other modes of mental separation, which may be termed *discrimination* and *dissociation*. Discrimination has to do merely with the senses of terms, and only draws a distinction in meaning. Dissociation is that separation which, in the absence of a constant association, is permitted by the law of association of images. It is the consciousness of one thing, without the necessary simultaneous consciousness of the other. Abstraction or precision, therefore, supposes a greater separation than discrimination, but a less separation than dissociation. Thus I can discriminate red from blue, space from color, and color from space, but not red from color. I can prescind red from blue, and space from color (as is manifest from the fact that I actually believe there is an uncolored space between my face and the wall); but I cannot prescind color from space, nor red from color. I can dissociate red from blue, but not space from color, color from space, nor red from color.[8]

Precision is not a reciprocal process. It is frequently the case, that, while *A* cannot be prescinded from *B*, *B* can be prescinded from *A*. This circumstance is accounted for as follows. Elementary conceptions only arise upon the occasion of experience; that is, they are produced for the first time according to a general law, the condition of which is the existence of certain impressions. Now if a conception does not reduce the impressions upon which it follows to unity, it is a mere arbitrary addition to these latter; and elementary conceptions do not arise thus arbitrarily. But if the impressions could be definitely comprehended without the conception, this latter would not reduce them to unity. Hence, the impressions (or more immediate conceptions) cannot be definitely conceived or attended to, to the neglect of an elementary conception which reduces them to unity. On the other hand, when such a conception has once been obtained, there is, in general, no reason why the premisses which have oc-

---

[6] This distinction is fundamental for Peirce's sense that a scrupulous attention to logic leads to radical metaphysical clarifications—in this instance, by pointing out, without polemic, that much traditional metaphysical speculation is without content because it begins and ends by attempting either to conceive of predicates as if they could be conceived to be substances, or of subjects, as if they could be the focus of discourse concerning being—without recognizing (Scotus is an exception) the problem as an insufficiency pervading Western metaphysics. See Carnap (below, page 980), who makes a similar point by highly polemical, empirical, and ultimately self-contradictory means; and Heidegger (below, page 1051) whose preoccupation with the question of *Being* leads to a counterproductive and ultimately mystifying dismissal of technical logic.

[7] [Peirce, added after publication] *Precision.* (1) A high degree of approximation, only attainable by the thorough application of the most refined methods of science.

(2) Its earlier meaning, still more or less used by logicians, is derived from a meaning given to *praecisio* by Scotus and other scholastics: the act of supposing (whether with consciousness of fiction or not) something about one element of a percept, upon which the thought dwells, without paying any regard to other elements. Precision implies more than mere discrimination, which relates merely to the essence of a term. Thus I can, by an act of discrimination, separate color from extension; but I cannot do so by precision, since I cannot suppose that in any possible universe color (not color-sensation, but color as a quality of an object) exists without extension. So with *triangularity* and *trilaterality*. On the other hand, precision implies much less than dissociation, which, indeed, is not a term of logic, but of psychology. It is doubtful whether a person who is not devoid of the sense of sight can separate space from color by dissociation, or, at any rate, not without great difficulty; but he can, and, indeed, does do so, by *precision*, if he thinks a vacuum is uncolored. So it is, likewise, with space and tridimensionality.

Some writers called every description of *abstraction* by the name *precision*, dividing precision into the real and the mental, and the latter into the negative and the positive; but the better usage named these abstraction divided into *real* and *intentional*, and the latter into *negative* (in which character from which abstraction is made is imagined to be *deniable* of the subject prescinded) and into *precisive abstraction* or *precision*, where the subject prescinded is supposed (in some hypothetical state of things) without any supposition, whether affirmative or negative, in respect to the character abstracted. Hence, the *brocard: abstrahentium non est mendacium* [abstraction is not falsehood] (generally enunciated in connection with the *De Anima*, III, VII, 7). Scotus (in II *Physic*., *Expositio* 20 *textus* 18) says: *"Et si aliquis dicat, quod Mathematici tunc faciunt mendacium: quia considerant ista, quasi essent abstracta a motu, et materia; quae tamen sunt coniuncta materiae. Respondet, quod non faciunt mendacium: quia Mathematicus non considerat, utrum id, de quo demonstrat suas passiones, sit coniunctum materiae, vel abstractum a materia."* This is not the place to treat of the many interesting logical, as well as psychological, discussions which have taken place concerning precision, which is one of the subjects which the scholastics treated in a comparatively modern way, although it leads directly to the question of nominalism and realism. It may, however, be mentioned that Scotus in many places draws a certain distinction variously designated by him and his followers (its nature and application is perhaps made as clear as anywhere in the *Opus Oxon.* III, xxii. *qu. unica, "Utrum Christus fuerit homo in triduo,"* i.e. between the crucifixion and the resurrection), which the Thomists mostly dispute. There is some account of the matter in Chauvinus, *Lexicon* (2d ed.), under *"Praecisio"* ... *Dictionary of Philosophy and Psychology*, vol. 2, pp. 323–4, Macmillan Co., New York, edition of 1911.

[8] In an earlier draft of this essay (cf. *Writings* 2) Peirce provided the following very useful table, depicting the distinctions in this paragraph in graphical form:

	Blue w/o Red	**Space w/o Color**	**Color w/o Space**	**Red w/o Color**
Discrimination:	0	0	0	*X*
Precision:	0	0	*X*	*X*
Dissociation:	0	*X*	*X*	*X*

0 = what it is possible to think
X = what it is NOT possible to think

casioned it should not be neglected, and therefore the explaining conception may frequently be prescinded from the more immediate ones and from the impressions.

550. The facts now collected afford the basis for a systematic method of searching out whatever universal elementary conceptions there may be intermediate between the manifold of substance and the unity of being. It has been shown that the occasion of the introduction of a universal elementary conception is either the reduction of the manifold of substance to unity, or else the conjunction to substance of another conception. And it has further been shown that the elements conjoined cannot be supposed without the conception, whereas the conception can generally be supposed without these elements. Now, empirical psychology discovers the occasion of the introduction of a conception, and we have only to ascertain what conception already lies in the data which is united to that of substance by the first conception, but which cannot be supposed without this first conception, to have the next conception in order in passing from being to substance.

It may be noticed that, throughout this process, *introspection* is not resorted to. Nothing is assumed respecting the subjective elements of consciousness which cannot be securely inferred from the objective elements.

551. The conception of *being* arises upon the formation of a proposition. A proposition always has, besides a term to express the substance, another to express the quality of that substance; and the function of the conception of being is to unite the quality to the substance. Quality, therefore, in its very widest sense, is the first conception in order in passing from being to substance.

Quality seems at first sight to be given in the impression. Such results of introspection are untrustworthy. A proposition asserts the applicability of a mediate conception to a more immediate one. Since this is asserted, the more mediate conception is clearly regarded independently of this circumstance, for otherwise the two conceptions would not be distinguished, but one would be thought through the other, without this latter being an object of thought, at all. The mediate conception, then, in order to be *asserted* to be applicable to the other, must first be considered without regard to this circumstance, and taken immediately. But, taken immediately, it transcends what is given (the more immediate conception), and its applicability to the latter is hypothetical. Take, for example, the proposition, "This stove is black." Here the conception of *this stove* is the more immediate, that of black the more mediate, which latter, to be predicated of the former, must be discriminated from it and considered *in itself*, not as applied to an object, but simply as embodying a quality, *blackness*. Now this *blackness* is a pure species or abstraction, and its application to this stove is entirely hypothetical.[9] The same thing is meant by "the stove is black," as by "there is blackness in the stove." *Embodying blackness* is the equivalent of *black*.[10] The proof is this. These conceptions are applied indifferently to precisely the same facts. If, therefore, they were different, the one which was first applied would fulfil every function of the other; so that one of them would be superfluous. Now a superfluous conception is an arbitrary fiction, whereas elementary conceptions arise only upon the requirement of experience; so that a superfluous elementary conception is impossible. Moreover, the conception of a pure abstraction is indispensable, because we cannot comprehend an agreement of two things, except as an agreement in some respect, and this respect is such a pure abstraction as blackness. Such a pure abstraction, reference to which constitutes a *quality* or general attribute, may be termed a *ground*.

Reference to a ground cannot be prescinded from being, but being can be prescinded from it.[11]

552. Empirical psychology has established the fact that we can know a quality only by means of its contrast with or similarity to another.[12] By contrast and agreement a thing is referred to a correlate, if this term may be used in a wider sense than usual. The occasion of the introduction of the conception of reference to a ground is the reference to a correlate, and this is, therefore, the next conception in order.

Reference to a correlate cannot be prescinded from reference to a ground; but reference to a ground may be prescinded from reference to a correlate.

553. The occasion of reference to a correlate is obviously by comparison. This act has not been sufficiently studied by the psychologists, and it will, therefore, be

---

[9] While this paragraph requires very close attention, Peirce's point is simple: the substance (the stove) is the more immediate in experience, but since the proposition "The stove is black" does unify the contents of consciousness (is apprehended as meaningful), the assertion that the predicate does belong to the substance implies that the predicate, the quality, is *first*, in any theory of reality sufficient to permit such simple and seemingly mundane assertions. But there is no need then to posit something like a Platonic Idea of blackness, as if it were *eidos* (form), or *ousia* (substance). It is what it is, a pure abstraction, without reference to anything else, and what is given in intuition is a specific sensation or feeling. But our sense of reality absolutely depends on such pure abstractions: if anything is real, they must be.

[10] [Peirce] This agrees with the author of *De Generibus et Speciebus, Ouvrages Inedits d'Abélard* (Paris, 1836), p. 528. (*Of Genus and Species, Unedited Works of Abelard;* author unidentified.)

[11] This is the first of three similar principles, in an ascending hierarchy. In this case, being can be thought alone, but reference to a ground cannot be thought without also thinking being.

[12] Kloesel and Houser note Peirce's comment on this statement in MS 785: "It may be doubted whether it was philosophical to rest this matter on empirical psychology. The question is extremely difficult." (*Writings* 2, 94).

necessary to adduce some examples to show in what it consists.[13] Suppose we wish to compare the letters p and b. We may imagine one of them to be turned over on the line of writing as an axis, then laid upon the other, and finally to become transparent so that the other can be seen through it. In this way we shall form a new image which mediates between the images of the two letters, inasmuch as it represents one of them to be (when turned over) the likeness of the other. Again, suppose we think of a murderer as being in relation to a murdered person; in this case we conceive the act of the murder, and in this conception it is represented that corresponding to every murderer (as well as to every murder) there is a murdered person; and thus we resort again to a mediating representation which represents the relate as standing for a correlate with which the mediating representation is itself in relation. Again, suppose we look up the word *homme* in a French dictionary; we shall find opposite to it the word *man,* which, so placed, represents *homme* as representing the same two-legged creature which *man* itself represents. By a further accumulation of instances, it would be found that every comparison requires, besides the related thing, the ground, and the correlate, also a *mediating representation which represents the relate to be a representation of the same correlate which this mediating representation itself represents.* Such a mediating representation may be termed an *interpretant,* because it fulfils the office of an interpreter, who says that a foreigner says the same thing which he himself says. The term representation is here to be understood in a very extended sense, which can be explained by instances better than by a definition.[14] In this sense, a word represents a thing to the conception in the mind of the hearer, a portrait represents the person for whom it is intended to the conception of recognition, a weathercock represents the direction of the wind to the conception of him who understands it, a barrister represents his client to the judge and jury whom he influences.

Every reference to a correlate, then, conjoins to the substance the conception of a reference to an interpretant; and this is, therefore, the next conception in order in passing from being to substance.

Reference to an interpretant cannot be prescinded from reference to a correlate; but the latter can be prescinded from the former.

554. Reference to an interpretant is rendered possible and justified by that which renders possible and justifies comparison. But that is clearly the diversity of impressions. If we had but one impression, it would not require to be reduced to unity, and would therefore not need to be thought of as referred to an interpretant, and the conception of reference to an interpretant would not arise. But since there is a manifold of impressions, we have a feeling of complication or confusion, which leads us to differentiate this impression from that, and then, having been differentiated, they require to be brought to unity. Now they are not brought to unity until we conceive them together as being ours, that is, until we refer them to a conception as their interpretant. Thus, the reference to an interpretant arises upon the holding together of diverse impressions, and therefore it does not join a conception to the substance, as the other two references do, but unites directly the manifold of the substance itself. It is, therefore, the last conception in order in passing from being to substance.

555. The five conceptions thus obtained, for reasons which will be sufficiently obvious, may be termed categories. That is,

Being

Quality (reference to a ground)
Relation (reference to a correlate)
Representation (reference to an interpretant)

---

[13] The examples Peirce offers below all look forward to the introduction of his third category, the *"interpretant,"* thereby passing perhaps too quickly over the second, the reference to a correlate, which consists in the comparison of one instance (for example, the color of the stove) with another (for example, the color of my shoes). The same (with the same psychological difficulty) applies to the comparison of one instance of the color of the stove (say, on Tuesday) and another, on another day or at a different time, thereby involving memory. In either case, or rather, in both, the comparison is still crucial since it is what gives occasion for the introduction of the conception of the interpretant.

[14] This notoriously difficult concept, as in the case of Thomas Kuhn's use of the term "paradigm" (see below, page 1282), is not only understood in an extended sense, it cannot be (given what Peirce has already argued) understood without examples, since the mediating representation is emphatically *not* the concept as signified, linked to the acoustic image as signifier in Saussure (below, page 787). Hence Peirce's confusing definition, placing the mediating representation between *relate* and *correlate* as an assertion: what the relate represents is the same as what the correlate represents. Note that Peirce thereby carefully avoids saying what it is, since it depends upon a reference to *specific* correlates. This also confers upon this conception the possibility of indefinite extension, just as the identification of one predicate opens the possibility of indefinite predictability. The "meaning" of an interpretant, that is, can grow and develop without losing its identity or integrity, so long as it can be traced back to the correlates which occasioned and propelled it. In a later essay, "The Law of Mind" (*Collected Papers* 6, 106–63), Peirce articulates the principle in these terms: "Logical analysis applied to mental phenomena shows that there is but one law of mind, namely, that ideas tend to spread continuously and to affect certain others which stand to them in a peculiar relation of affectability. In this spreading they lose intensity and become welded with other ideas."

Substance

The three intermediate conceptions may be termed accidents.[15]

556. This passage from the many to the one is numerical. The conception of a *third* is that of an object which is so related to two others, that one of these must be related to the other in the same way in which the third is related to that other. Now this coincides with the conception of an interpretant. An other is plainly equivalent to a *correlate.* The conception of second differs from that of other, in implying the possibility of a third. In the same way, the conception of *self* implies the possibility of an *other.* The *ground* is the self abstracted from the concreteness which implies the possibility of an other.

557. Since no one of the categories can be prescinded from those above it, the list of supposable objects which they afford is,

What is

Quale (that which refers to a ground)
Relate (that which refers to ground and correlate)
Representamen (that which refers to ground, correlate, and interpretant)

It

558. A quality may have a special determination which prevents its being prescinded from reference to a correlate. Hence there are two kinds of relation.

First. That of relates whose reference to a ground is a prescindible or internal quality.

Second. That of relates whose reference to a ground is an unprescindible or relative quality.

In the former case, the relation is a mere *concurrence* of the correlates in one character, and the relate and correlate are not distinguished. In the latter case the correlate is set over against the relate, and there is in some sense an *opposition.*

Relates of the first kind are brought into relation simply by their agreement. But mere disagreement (unrecognized) does not constitute relation, and therefore relates of the second kind are only brought into relation by correspondence in fact.

A reference to a ground may also be such that it cannot be prescinded from a reference to an interpretant. In this case it may be termed an *imputed* quality. If the reference of a relate to its ground can be prescinded from reference to an interpretant, its relation to its correlate is a mere concurrence or community in the possession of a quality, and therefore the reference to a correlate can be prescinded from reference to an interpretant. It follows that there are three kinds of representations.

First. Those whose relation to their objects is a mere community in some quality, and these representations may be termed *likenesses.*[16]

Second. Those whose relation to their objects consists in a correspondence in fact, and these may be termed *indices* or *signs.*[17]

Third. Those the ground of whose relation to their objects is an imputed character, which are the same as general signs, and these may be termed *symbols.*

559. I shall now show how the three conceptions of reference to a ground, reference to an object, and reference to an interpretant are the fundamental ones of at least one universal science, that of logic. Logic is said to treat of second intentions as applied to first.[18] It would lead me too far away from the matter in hand to discuss the truth of this statement; I shall simply adopt it as one which seems to me to afford a good definition of the subject-genus of this science. Now, second intentions are the objects of the understanding considered as representations, and the first intentions to which they apply are the objects of those representations. The objects of the understanding, considered as representations, are symbols, that is, signs which are at least potentially general. But the rules of logic hold good of any symbols, of those which are written or spoken as well as of those which are thought. They have no immediate application to likenesses or indices, because no arguments can be constructed of these alone, but do apply to all symbols. All symbols, indeed, are in one sense relative to the understanding, but only in the sense in which also all things are relative to the understanding. On this account, therefore, the relation to the understanding need not be expressed in the definition of the sphere of logic, since it determines no

---

[15] In later work, Peirce simplified this schema to three categories, *First, Second, Third,* generally following the outlines of the discussion below. For its basis in the triad, *ground, object, interpretant,* cf. *Collected Papers* 2.227–29; for a fuller exposition of the categories, cf. *Collected Papers* 1.300–53. See also "What Pragmatism Is," (below, page 668).

[16] [*CP* eds.] In later writings called "icons."

[17] [*CP* eds.] In later writings an index is always taken to be but one of many kinds of signs; a sign being understood in some sense similar to that given in 540.

[18] [*CP* eds.] See Peirce's definition in the *Century Dictionary* (1889) Intention 8; also Albertus Magnus, *Meta.* I, 1, 1, and Th. Aquinas, *Meta.* IV, 4, f. 43 v. A.

limitation of that sphere. But a distinction can be made between concepts which are supposed to have no existence except so far as they are actually present to the understanding, and external symbols which still retain their character of symbols so long as they are only *capable* of being understood. And as the rules of logic apply to these latter as much as to the former (and though only through the former, yet this character, since it belongs to all things, is no limitation), it follows that logic has for its subject-genus all symbols and not merely concepts.[19] We come, therefore, to this, that logic treats of the reference of symbols in general to their objects. In this view it is one of a trivium of conceivable sciences. The first would treat of the formal conditions of symbols having meaning, that is of the reference of symbols in general to their grounds or imputed characters, and this might be called formal grammar;[20] the second, logic,[21] would treat of the formal conditions of the truth of symbols; and the third would treat of the formal conditions of the force of symbols, or their power of appealing to a mind, that is, of their reference in general to interpretants, and this might be called formal rhetoric.[22]

There would be a general division of symbols, common to all these sciences; namely, into,

1. Symbols which directly determine only their *grounds* or imputed qualities, and are thus but sums of marks or *terms;*

2. Symbols which also independently determine their *objects* by means of other term or terms, and thus, expressing their own objective validity, become capable of truth or falsehood, that is, are *propositions;* and,

3. Symbols which also independently determine their *interpretants,* and thus the minds to which they appeal, by premissing a proposition or propositions which such a mind is to admit. These are *arguments.*

And it is remarkable that, among all the definitions of the proposition, for example, as the *oratio indicativa,*[23] as the subsumption of an object under a concept, as the expression of the relation of two concepts, and as the indication of the mutable ground of appearance, there is, perhaps, not one in which the conception of reference to an object or correlate is not the important one. In the same way, the conception of reference to an interpretant or third, is always prominent in the definitions of argument.

In a proposition, the term which separately indicates the object of the symbol is termed the subject, and that which indicates the ground is termed the predicate. The objects indicated by the subject (which are always potentially a plurality—at least, of phases or appearances) are therefore stated by the proposition to be related to one another on the ground of the character indicated by the predicate. Now this relation may be either a concurrence or an opposition. Propositions of concurrence are those which are usually considered in logic; but I have shown in a paper upon the classification of arguments[24] that it is also necessary to consider separately propositions of opposition, if we are to take account of such arguments as the following:

Whatever is the half of anything is less than that of which it is the half:

> A is half of B;
> A is less than B.

The subject of such a proposition is separated into two terms, a "subject nominative" and an "object accusative."

In an argument, the premisses form a representation of the conclusion, because they indicate the interpretant of the argument, or representation representing it to represent its object. The premisses may afford a likeness, index, or symbol of the conclusion. In deductive argument, the conclusion is represented by the premisses as by a general sign under which it is contained. In hypotheses, something like the conclusion is proved, that is, the premisses form a likeness of the conclusion. Take, for example, the following argument:

M is, for instance, PI, PII, PIII, and PIV;
S is PI, PII, PIII, and PIV:
∴ S is M.

Here the first premiss amounts to this, that "PI, PII, PIII, and PIV" is a likeness of M, and thus the premisses are or represent a likeness of the conclusion. That it is different with induction another example will show.

SI, SII, SIII, and SIV are taken as samples of the collection M;
SI, SII, SIII, and SIV are P:
∴ All M is P.

---

[19] [Peirce] Herbart says *"Unsre sämmtlichen Gedanken lassen sich von zwei Seiten betrachten; theils als Thätigkeiten unseres Geistes, theils in Hinsicht dessen, was durch sie gedacht wird. In letzterer Beziehung heissen sie Begreffe, weches Wort, indem es das Begriffene bezeichnet, zu abstrahiren gebietet von der Art und Weise, wie wir den Gedanken empfangen, producieren, oder reproducieren mögen."* [All of our thoughts may be regarded from two viewpoints, partly as activities of our mind, partly as what is thought through them. In the latter, we call them concepts, the term signifying that what is thought is abstracted from the mode and manner in which we may receive, produce, or reproduce the thought.] From Johann Friedrich Herbart, *Lehrbuch zur Einleitung in die Philosophie* (vol. I of *Sämmtliche Werke* [Leipzig, 1850]). But the whole difference between a concept and an external sign lies in these respects which logic ought, according to Herbart, to abstract from.

[20] [*CP* eds.] Later called Speculative Grammar or Stechiology.

[21] [*CP* eds.] Later called Critical Logic or Critic.

[22] [*CP* eds.] Later called Speculative Rhetoric or Methodeutic.

[23] "Indicative speech."

[24] [*CP* eds.] See *Collected Papers* vol. 2, bk. III, ch. 2.

Hence the first premiss amounts to saying that "SI, SII, SIII, and SIV" is an index of M. Hence the premisses are an index of the conclusion.

The other divisions of terms, propositions, and arguments arise from the distinction of extension and comprehension. I propose to treat this subject in a subsequent paper.[25] But I will so far anticipate that as to say that there is, first, the direct reference of a symbol to its objects, or its denotation; second, the reference of the symbol to its ground, through its object, that is, its reference to the common characters of its objects, or its connotation; and third, its reference to its interpretants through its object, that is, its reference to all the synthetical propositions in which its objects in common are subject or predicate, and this I term the information it embodies. And as every addition to what it denotes, or to what it connotes, is effected by means of a distinct proposition of this kind, it follows that the extension and comprehension of a term are in an inverse relation, as long as the information remains the same, and that every increase of information is accompanied by an increase of one or other of these two quantities. It may be observed that extension and comprehension are very often taken in other senses in which this last proposition is not true.

This is an imperfect view of the application which the conceptions which, according to our analysis, are the most fundamental ones find in the sphere of logic. It is believed, however, that it is sufficient to show that at least something may be usefully suggested by considering this science in this light.

Lessons from the History of Philosophy

§1. Nominalism [1903][1]

15. Very early in my studies of logic, before I had really been devoting myself to it more than four or five years, it became quite manifest to me that this science was in a bad condition, entirely unworthy of the general state of intellectual development of our age; and in consequence of this, every other branch of philosophy except ethics—for it was already clear that psychology was a special science and no part of philosophy—was in a similar disgraceful state. About that time—say the date of [Henry L.] Mansel's *Prolegomena Logica* [1851]—Logic touched bottom. There was no room for it to become more degraded. It had been sinking steadily, and relatively to the advance of physical science, by no means slowly from the time of the revival of learning—say from the date of the last fall of Constantinople [1453]. One important addition to the subject had been made early in the eighteenth century, the Doctrine of Chances. But this had not come from the professed logicians, who knew nothing about it. Whewell, it is true, had been doing some fine work; but it was not of a fundamental character. De Morgan and Boole[2] had laid the foundations for modern exact logic, but they can hardly be said to have begun the erection of the edifice itself. Under these circumstances, I naturally opened the dusty folios of the scholastic doctors. Thought generally was, of course, in a somewhat low condition under the Plantagenets.[3] You can appraise it very well by the impression that Dante, Chaucer, Marco Polo, Froissart, and the great cathedrals make upon us. But [their] logic, relatively to the general condition of thought, was marvellously exact and critical. They can tell us nothing concerning methods of reasoning since their own reasoning was puerile; but their analyses of thought and their discussions of all those questions of logic that almost trench upon metaphysics are very instructive as well as very good discipline in that subtle kind of thinking that is required in logic.

16. In the days of which I am speaking, the age of Robert of Lincoln, Roger Bacon, St. Thomas Aquinas, and Duns Scotus, the question of nominalism and realism was regarded as definitively and conclusively settled in favor of realism. You know what the question was. It was whether laws and general types are figments of the mind or are real. If this be understood to mean whether there really are any laws and types, it is strictly speaking a question of metaphysics and not of logic. But as a first step toward its solution, it is proper to ask whether, granting that our common-sense beliefs are true, the analysis of the meaning of those beliefs shows that, according to those beliefs, laws and

[25] "Upon Logical Comprehension and Extension" *Writings* 2, 70–86.

"Lessons from the History of Philosophy" is a collection of comments written at diverse times, but assembled by the original editors of *Collected Papers* at the start of the first volume. From *Collected Papers* 1.15-42. The final entry added here is from A GUESS AT THE RIDDLE consisting of notes and manuscripts for an uncompleted, unpublished book, composed c. 1890. All passages are reprinted from *Collected Papers* (Cambridge, Mass.: Harvard University Press, 1931). For convenience of reference, paragraph numbers from *Collected Papers* have been retained.

[1] From the "Lowell Lectures of 1903," Lecture IIIa.

[2] William Whewell (1794–1866), British philosopher, historian, and philosopher of science; Augustus de Morgan (1806–1871), British logician and mathematician; George Boole (1816–1864), self-taught English mathematician, inventor of binary or Boolean algebra, appointed Professor of Mathematics at Queen's College in Ireland in 1849.

[3] Royal house in England, 1154 to 1485, also called the House of Anjou or the Anjevin dynasty, representing both the houses of Lancaster and York (cf. "War of the Roses"), producing fourteen kings from Henry I to Richard III.

types are objective or subjective. This is a question of logic rather than of metaphysics—and as soon as this is answered the reply to the other question immediately follows after.

17. Notwithstanding a great outburst of nominalism in the fourteenth century which was connected with politics, the nominalists being generally opposed to the excessive powers of the pope and in favor of civil government, a connection that lent to the philosophical doctrine a factitious following, the Scotists, who were realists, were in most places the predominant party, and retained possession of the universities. At the revival of learning they stubbornly opposed the new studies; and thus the word Duns, the proper name of their master, came to mean an adversary of learning.[4] The word originally further implied that the person so called was a master of subtle thought with which the humanists were unable to cope. But in another generation the disputations by which that power of thought was kept in training had lost their liveliness; and the consequence was that Scotism died out when the strong Scotists died. It was a mere change of fashion.

18. The humanists were weak thinkers. Some of them no doubt might have been trained to be strong thinkers; but they had no severe training in thought. All their energies went to writing a classical language and an artistic style of expression. They went to the ancients for their philosophy; and mostly took up the three easiest of the ancient sects of philosophy, Epicureanism, Stoicism, and Scepticism. Epicureanism was a doctrine extremely like that of John Stuart Mill. The Epicureans alone of the later ancient schools believed in inductive reasoning, which they grounded upon the uniformity of nature, although they made the uniformity of nature to consist in somewhat different characters from those Stuart Mill emphasizes. Like Mill, the Epicureans were extreme nominalists. The Stoics advocated the flattest materialism, which nobody any longer has any need of doing since the new invention of Monism enables a man to be perfectly materialist in substance, and as idealistic as he likes in words. Of course the Stoics could not but be nominalists. They took no stock in inductive reasoning. They held it to be a transparent fallacy. The Sceptics of the Renaissance were something like the agnostics of the generation now passing away, except that they went much further. Our agnostics contented themselves with declaring everything beyond ordinary generalizations of experience to be unknowable, while the Sceptics did not think any scientific knowledge of any description to be possible. If you turn over the pages, for example, of Cornelius Agrippa's book *De [incertitudine et] vanitate scientiarum [et artium]* [1531], you will find he takes up every science in succession, arithmetic, geometry, mechanics, optics, and after examination pronounces each to be altogether beyond the power of the human mind. Of course, therefore, as far as they believed in anything at all, the Sceptics were nominalists.

19. In short, there was a tidal wave of nominalism. Descartes was a nominalist. Locke and all his following, Berkeley, Hartley, Hume, and even Reid, were nominalists. Leibniz was an extreme nominalist, and Rémusat [C. F. M.?] who has lately made an attempt to repair the edifice of Leibnizian monadology, does so by cutting away every part which leans at all toward realism. Kant was a nominalist; although his philosophy would have been rendered compacter, more consistent, and stronger if its author had taken up realism, as he certainly would have done if he had read Scotus. Hegel was a nominalist of realistic yearnings. I might continue the list much further. Thus, in one word, all modern philosophy of every sect has been nominalistic.

20. In a long notice of Frazer's *Berkeley*, in the *North American Review* for October 1871,[5] I declared for realism. I have since very carefully and thoroughly revised my philosophical opinions more than half a dozen times, and have modified them more or less on most topics; but I have never been able to think differently on that question of nominalism and realism. In that paper I acknowledged that the tendency of science has been toward nominalism; but the late Dr. Francis Ellingwood Abbot in the very remarkable introduction to his book entitled *"Scientific Theism"* [1885], showed on the contrary, quite conclusively, that science has always been at heart realistic, and always must be so; and upon comparing his writings with mine, it is easily seen that these features of nominalism which I pointed out in science are merely superficial and transient.

21. The heart of the dispute lies in this. The modern philosophers—one and all, unless Schelling[6] be an exception—recognize but one mode of being, the being of an individual thing or fact, the being which consists in the object's crowding out a place for itself in the universe, so to speak, and reacting by brute force of fact, against all other things. I call that existence.

22. Aristotle, on the other hand, whose system, like all the greatest systems, was evolutionary, recognized besides an embryonic kind of being, like the being of a tree in its seed, or like the being of a future contingent event, depending on how a man shall decide to act. In a few passages Aristotle seems to have a dim aperçue of a third mode of being in the entelechy.[7] The embryonic being for Aristotle was

[6] Friedrich Schelling (1775–1854), Post-Kantian German philosopher.

[7] The realized expression of a potential.

the being he called matter, which is alike in all things, and which in the course of its development took on form. Form is an element having a different mode of being. The whole philosophy of the scholastic doctors is an attempt to mould this doctrine of Aristotle into harmony with christian truth. This harmony the different doctors attempted to bring about in different ways. But all the realists agree in reversing the order of Aristotle's evolution by making the form come first, and the individuation of that form come later. Thus, they too recognized two modes of being; but they were not the two modes of being of Aristotle.

23. My view is that there are three modes of being. I hold that we can directly observe them in elements of whatever is at any time before the mind in any way. They are the being of positive qualitative possibility, the being of actual fact, and the being of law that will govern facts in the future.

24. Let us begin with considering actuality, and try to make out just what it consists in. If I ask you what the actuality of an event consists in, you will tell me that it consists in its happening then and there. The specifications then and there involve all its relations to other existents. The actuality of the event seems to lie in its relations to the universe of existents. A court may issue injunctions and judgments against me and I not care a snap of my finger for them. I may think them idle vapor. But when I feel the sheriff's hand on my shoulder, I shall begin to have a sense of actuality. Actuality is something brute. There is no reason in it. I instance putting your shoulder against a door and trying to force it open against an unseen, silent, and unknown resistance. We have a two-sided consciousness of effort and resistance, which seems to me to come tolerably near to a pure sense of actuality. On the whole, I think we have here a mode of being of one thing which consists in how a second object is. I call that Secondness.

25. Besides this, there are two modes of being that I call Firstness and Thirdness. Firstness is the mode of being which consists in its subject's being positively such as it is regardless of aught else. That can only be a possibility. For as long as things do not act upon one another there is no sense or meaning in saying that they have any being, unless it be that they are such in themselves that they may perhaps come into relation with others. The mode of being a redness, before anything in the universe was yet red, was nevertheless a positive qualitative possibility. And redness in itself, even if it be embodied, is something positive and sui generis. That I call Firstness. We naturally attribute Firstness to outward objects, that is we suppose they have capacities in themselves which may or may not be already actualized, which may or may not ever be actualized, although we can know nothing of such possibilities [except] so far as they are actualized.

26. Now for Thirdness. Five minutes of our waking life will hardly pass without our making some kind of prediction; and in the majority of cases these predictions are fulfilled in the event. Yet a prediction is essentially of a general nature, and cannot ever be completely fulfilled. To say that a prediction has a decided tendency to be fulfilled, is to say that the future events are in a measure really governed by a law. If a pair of dice turns up sixes five times running, that is a mere uniformity. The dice might happen fortuitously to turn up sixes a thousand times running. But that would not afford the slightest security for a prediction that they would turn up sixes the next time. If the prediction has a tendency to be fulfilled, it must be that future events have a tendency to conform to a general rule. "Oh," but say the nominalists, "this general rule is nothing but a mere word or couple of words!" I reply, "Nobody ever dreamed of denying that what is general is of the nature of a general sign; but the question is whether future events will conform to it or not. If they will, your adjective 'mere' seems to be ill-placed." A rule to which future events have a tendency to conform is ipso facto an important thing, an important element in the happening of those events. This mode of being which consists, mind my word if you please, the mode of being which consists in the fact that future facts of Secondness will take on a determinate general character, I call a Thirdness.

§2. Conceptualism [1909][8]

27. Many philosophers call their variety of nominalism, "conceptualism"; but it is essentially the same thing; and their not seeing that it is so is but another example of that loose and slapdash style of thinking that has made it possible for them to remain nominalists. Their calling their "conceptualism" a middle term between realism and nominalism is itself an example in the very matter to which nominalism relates. For while the question between nominalism and realism is, in its nature, susceptible of but two answers: yes and no, they make an idle and irrelevant point which had been thoroughly considered by all the great realists; and instead of drawing a valid distinction, as they suppose, only repeat the very same confusion of thought which made them nominalists. The question was whether all properties, laws of nature, and predicates of more than an actually existent

---

[8] [*CP* ed.] From "Essays on Meaning," June 1909.

subject are, without exception, mere figments or not.[9] The conceptualists seek to wedge in a third position conflicting with the principle of excluded middle. They say, "Those universals are real, indeed; but they are only real thoughts." So much may be said of the philosopher's stone. To give that answer constitutes a man a nominalist. Are the laws of nature, and that property of gold by which it will yield the purple of Cassius,[10] no more real than the philosopher's stone? No, the conceptualists admit that there is a difference; but they say that the laws of nature and the properties of chemical species are results of thinking. The great realists had brought out all the truth there is in that much more distinctly long before modern conceptualism appeared in the world. They showed that the general is not capable of full actualization in the world of action and reaction but is of the nature of what is thought, but that our thinking only apprehends and does not create thought, and that that thought may and does as much govern outward things as it does our thinking. But those realists did not fall into any confusion between the real fact of having a dream and the illusory object dreamed. The conceptualist doctrine is an undisputed truism about thinking, while the question between nominalists and realists relates to thoughts, that is, to the objects which thinking enables us to know.

* * *

§4. Kant and His Refutation of Idealism[11]

35. Kant's whole philosophy turns upon his logic. He gives the name of logic to the greater part of his *Critic of the Pure Reason,* and it is a result of the great fault of his logical theory that he does not extend that name to the whole work. This greatest fault was at the same [time] the greatest merit of his doctrine: it lay in his sharp discrimination of the intuitive and the discursive processes of the mind. The distinction itself is not only familiar to everybody but it had long played a part in philosophy. Nevertheless, it is on such obvious distinctions that the greater systems have been founded, and [Kant] saw far more clearly than any predecessor had done the whole philosophical import of this distinction. This was what emancipated him from Leibnizianism, and at the same time turned him against sensationalism. It was also what enabled him to see that no general description of existence is possible, which is perhaps the most valuable proposition that the *Critic* contains. But he drew too hard a line between the operations of observation and of ratiocination. He allows himself to fall into the habit of thinking that the latter only begins after the former is complete; and wholly fails to see that even the simplest syllogistic conclusion can only be drawn by observing the relations of the terms in the premisses and conclusion. His doctrine of the schemata can only have been an afterthought, an addition to his system after it was substantially complete. For if the schemata had been considered early enough, they would have overgrown his whole work.

36. Kant's refutation of idealism in the second edition of the *Critic of the Pure Reason* has been often held to be inconsistent with his main position or even to be knowingly sophistical. It appears to me to be one of the numerous passages in that work which betray an elaborated and vigorous analysis, marred in the exposition by the attempt to state the argument more abstractly and demonstratively than the thought would warrant.

In "Note 1,"[12] Kant says that his argument beats idealism at its own game. How is that? The idealist says that all that we know immediately, that is, otherwise than inferentially, is what is present in the mind; and things out of the mind are not so present. The whole idealist position turns upon this conception of the present.

37. The idealistic argument turns upon the assumption that certain things are absolutely "present," namely what we have in mind at the moment, and that nothing else can be immediately, that is, otherwise than inferentially known. When this is once granted, the idealist has no difficulty in showing that that external existence which we cannot know immediately we cannot know, at all. Some of the arguments used for this purpose are of little value, because they only

---

[9] [Peirce] It must not be imagined that any notable realist of the thirteenth or fourteenth century took the ground that any "universal" was what we in English should call a "thing," as it seems that, in an earlier age, some realists and some nominalists, too, had done; though perhaps it is not quite certain that they did so, their writings being lost. Their very definition of a "universal" admits that it is of the same generic nature as a word, namely, is: *"Quod natum optum est praedicari de pluribus."* ["That which is intended to be predicated of many things"] Neither was it their doctrine that any "universal" itself is real. They might, indeed, some of them, think so; but their realism did not consist in that opinion, but in holding that what the word signifies, in contradistinction to what it can be truly said of, is real. Anybody may happen to opine that "the" is a real English word; but that will not constitute him a realist. But if he thinks that, whether the word "hard" itself be real or not, the property, the character, the predicate, hardness, is not invented by men, as the word is, but is really and truly in the hard things and is one in them all, as a description of habit, disposition, or behavior, then he is a realist.

[10] A pigment formed of certain salts of gold, used to paint porcelain. Named after A. Cassius, seventeenth-century German physician.

[11] [*CP* eds.] 35 is an unpublished, uncompleted review of T. K. Abbott's translation of Kant's *Introduction to Logic,* etc. Longmans Green & Co., 1885. 37–38 is "Notes on the Question of the Existence of an External World." c. 1890. 36 and 39 are from fragmentary alternative mss. of that same date.

[12] Cf. *Critique of Pure Reason* [Kemp Smith trans.], Transcendental Analytic, page 245.

go to show that our knowledge of an external world is fallible; now there is a world of difference between fallible knowledge and no knowledge. However, I think it would have to be admitted as a matter of logic that if we have no immediate perception of a non-ego, we can have no reason to admit the supposition of an existence so contrary to all experience as that would in that case be.

38. But what evidence is there that we can immediately know only what is "present" to the mind? The idealists generally treat this as self-evident; but, as Clifford[13] jestingly says, "it is evident" is a phrase which only means "we do not know how to prove." The proposition that we can immediately perceive only what is present seems to me parallel to that other vulgar prejudice that "a thing cannot act where it is not." An opinion which can only defend itself by such a sounding phrase is pretty sure to be wrong. That a thing cannot act where it is not is plainly an induction from ordinary experience, which shows no forces except such as act through the resistance of materials, with the exception of gravity which, owing to its being the same for all bodies, does not appear in ordinary experience like a force. But further experience shows that attractions and repulsions are the universal types of forces. A thing may be said to be wherever it acts; but the notion that a particle is absolutely present in one part of space and absolutely absent from all the rest of space is devoid of all foundation. In like manner, the idea that we can immediately perceive only what is present seems to be founded on our ordinary experience that we cannot recall and reexamine the events of yesterday nor know otherwise than by inference what is to happen tomorrow. Obviously, then, the first move toward beating idealism at its own game is to remark that we apprehend our own ideas only as flowing in time, and since neither the future nor the past, however near they may be, is present, there is as much difficulty in conceiving our perception of what passes within us as in conceiving external perception. If so, replies the idealist, instead of giving up idealism we must go still further to nihilism. Kant does not notice this retort; but it is clear from his footnote that he would have said: Not so; for it is impossible we should so much as think we think in time unless we do think in time; or rather, dismissing blind impossibility, the mere imagination of time is a clear perception of the past. Hamilton[14] stupidly objects to Reid's[15] phrase "immediate memory"; but an immediate, intuitive consciousness of time clearly exists wherever time exists. But once grant immediate knowledge in time, and what becomes of the idealist theory that we immediately know only the present? For the present can contain no time.

39. But Kant does not pursue this line of thought along the straight road to its natural result; because he is a sort of idealist himself. Namely, though not idealistic as to the substance of things, he is partially so in regard to their accidents. Accordingly, he introduces his distinction of the variable and the persistent *(beharrlich),* and seeks to show that the only way we can apprehend our own flow of ideas, binding them together as a connected flow, is by attaching them to an immediately perceived persistent externality. He refuses to inquire how that immediate external consciousness is possible, though such an inquiry might have probed the foundations of his system.

§5. Hegelism[16]

40. The critical logicians have been much affiliated to the theological seminaries. About the thinking that goes on in laboratories they have known nothing. Now the seminarists and religionists generally have at all times and places set their faces against the idea of continuous growth. That disposition of intellect is the most catholic element of religion. Religious truth having been once defined is never to be altered in the most minute particular; and theology being held as queen of the sciences, the religionists have bitterly fought by fire and tortures all great advances in the true sciences; and if there be no true continuous growth in men's ideas where else in the world should it be looked for? Thence, we find this folk setting up hard lines of demarcation, or great gulfs, contrary to all observation, between good men and bad, between the wise and foolish, between the spirit and the flesh, between all the different kinds of objects, between one quantity and the next. So shut up are they in this conception of the world that when the seminarist Hegel discovered that the universe is everywhere permeated with continuous growth (for that, and nothing else, is the "Secret of Hegel") it was supposed to be an entirely new idea, a century and a half after the differential calculus had been in working order.

41. Hegel, while regarding scientific men with disdain, has for his chief topic the importance of continuity, which was the very idea the mathematicians and physicists had been chiefly engaged in following out for three centuries. This made Hegel's work less correct and excellent in itself than it might have been; and at the same time hid its

true mode of affinity with the scientific thought into which the life of the race had been chiefly laid up. It was a misfortune for Hegelism, a misfortune for "philosophy," and a misfortune (in lesser degree) for science.

42. My philosophy resuscitates Hegel, though in a strange costume.

from
A Guess at the Riddle (c. 1890)[17]

3.368 . . . My whole method will be found to be in profound contrast with that of Hegel; I reject his philosophy in toto. Nevertheless, I have a certain sympathy with it, and fancy that if its author had only noticed a very few circumstances he would himself have been led to revolutionize his system. One of these is the double division or dichotomy of the second idea of the triad. He has usually overlooked external Secondness, altogether. In other words, he has committed the trifling oversight of forgetting that there is a real world with real actions and reactions. Rather a serious oversight that. Then Hegel had the misfortune to be unusually deficient in mathematics. He shows this in the very elementary character of his reasoning. Worse still, while the whole burden of his song is that philosophers have neglected to take Thirdness into account, which is true enough of the theological kind, with whom alone he was acquainted (for I do not call it acquaintance to look into a book without comprehending it), he unfortunately did not know, what it would have been of the utmost consequence for him to know, that the mathematical analysts had in great measure escaped this great fault, and that the thorough-going pursuit of the ideas and methods of the differential calculus would be sure to cure it altogether. Hegel's dialectical method is only a feeble and rudimentary application of the principles of the calculus to metaphysics. Finally Hegel's plan of evolving everything out of the abstractest conception by a dialectical procedure, though far from being so absurd as the experientialists think, but on the contrary representing one of the indispensable parts of the course of science, overlooks the weakness of individual man, who wants the strength to wield such a weapon as that.

The First Rule of Reason

135. Upon this first, and in one sense this sole, rule of reason, that in order to learn you must desire to learn, and in so desiring not be satisfied with what you already incline to think, there follows one corollary which itself deserves to be inscribed upon every wall of the city of philosophy:

Do not block the way of inquiry.

136. Although it is better to be methodical in our investigations, and to consider the economics of research, yet there is no positive sin against logic in trying any theory which may come into our heads, so long as it is adopted in such a sense as to permit the investigation to go on unimpeded and undiscouraged. On the other hand, to set up a philosophy which barricades the road of further advance toward the truth is the one unpardonable offence in reasoning, as it is also the one to which metaphysicians have in all ages shown themselves the most addicted.

Let me call your attention to four familiar shapes in which this venomous error assails our knowledge:

137. The first is the shape of absolute assertion. That we can be sure of nothing in science is an ancient truth. The Academy taught it. Yet science has been infested with overconfident assertion, especially on the part of the third-rate and fourth-rate men, who have been more concerned with teaching than with learning, at all times. No doubt some of the geometries still teach as a self-evident truth the proposition that if two straight lines in one plane meet a third straight line so as to make the sum of the internal angles on one side less than two right angles those two lines will meet on that side if sufficiently prolonged. Euclid, whose logic was more careful, only reckoned this proposition as a Postulate, or arbitrary Hypothesis. Yet even he places among his axioms the proposition that a part is less than its whole, and falls into several conflicts with our most modern geometry in consequence. But why need we stop to consider cases where some subtilty of thought is required to see that the assertion is not warranted when every book which applies philosophy to the conduct of life lays down as positive certainty propositions which it is quite as easy to doubt as to believe?

[17] From *Collected Papers* 3.368. [*CP* eds.] c. 1890. One of the drafts of this work is headed: "Notes for a Book, to be entitled 'A Guess at the Riddle,' with a Vignette of the Sphynx below the Title." This caption is followed by the remark, "And this book, if ever written, as it soon will be if I am in a situation to do it, will be one of the births of time."

"The First Rule of Reason" is from a series of lectures presented in Cambridge, Massachusetts, in (1898). For a reconstructed text of all the lectures, edited by Kenneth Laine Ketner, see *Reasoning and the Logic of Things* (Cambridge, Mass.: Harvard University Press, 1992). The text reprinted here is from *Collected Papers* (1931), vol. 1, #135–140.

138. The second bar which philosophers often set up across the roadway of inquiry lies in maintaining that this, that, and the other never can be known. When Auguste Comte was pressed to specify any matter of positive fact to the knowledge of which no man could by any possibility attain, he instanced the knowledge of the chemical composition of the fixed stars; and you may see his answer set down in the *Philosophie positive.*[1] But the ink was scarcely dry upon the printed page before the spectroscope was discovered and that which he had deemed absolutely unknowable was well on the way of getting ascertained. It is easy enough to mention a question the answer to which is not known to me today. But to aver that that answer will not be known tomorrow is somewhat risky; for oftentimes it is precisely the least expected truth which is turned up under the ploughshare of research. And when it comes to positive assertion that the truth never will be found out, that, in the light of the history of our time, seems to me more hazardous than the venture of Andrée.[2]

139. The third philosophical stratagem for cutting off inquiry consists in maintaining that this, that, or the other element of science is basic, ultimate, independent of aught else, and utterly inexplicable—not so much from any defect in our knowing as because there is nothing beneath it to know. The only type of reasoning by which such a conclusion could possibly be reached is retroduction. Now nothing justifies a retroductive inference except its affording an explanation of the facts. It is, however, no explanation at all of a fact to pronounce it inexplicable. That, therefore, is a conclusion which no reasoning can ever justify or excuse.

140. The last philosophical obstacle to the advance of knowledge which I intend to mention is the holding that this or that law or truth has found its last and perfect formulation—and especially that the ordinary and usual course of nature never can be broken through. "Stones do not fall from heaven," said Laplace,[3] although they had been falling upon inhabited ground every day from the earliest times. But there is no kind of inference which can lend the slightest probability to any such absolute denial of an unusual phenomenon.

Training in Reasoning

Since the vogue in this country of the Herbartian pedagogy,[1] . . . the old ideas which used to cluster about the phrase *Liberal Education* have become scattered. One of those ideas was that the matter of instruction in the common education was of less concern than the training of men's powers. The pedagogists of today sneer at this as an antiquated and crude conception. But for my part I continue to believe that the welfare of the commonwealth depends far less on the assent of all the citizens to any definite propositions—such, we will say, as the doctrine of the independence of the executive, legislative, and judiciary functions, which, after all are easily made handles for bosses, than it does in the power of recognizing the sort of thought and the sort of methods in which it will be well for the government and public opinion to put their trust. In the last analysis it comes to this, that the very focus and centre of common education should be placed in the art of thinking, *ad omnium methodorum principia viam habens* [which contains a path to the principles of all methods]. I do not know why a man should not devote himself to the training of his reasoning powers with as much assiduity as to corporal athletics.

There [are] a good many books that bear upon the subject. . . . But neither reading books nor working exercises—whether they be trivial or serious—will suffice to develop the reasoning powers. An analytical method of procedure is requisite which shall perfect one by one our performance of the different mental operations that enter into the business of inquiry. Now the mental operations concerned in reasoning are three. The first is Observation; the second is Experimentation; and the third is Habituation.

Observation consists of two parts which though theoretically they have much in common yet practically are of almost contrary natures. The first is a sort of subconscious induction, by which upon repeatedly reviewing an object of perception a certain element of it acquires great associational potency—that is, has a magnified tendency to call

---

From "Training in Reasoning" is from Peirce's 1898 Cambridge Lectures, reprinted here from *Reasoning and the Logic of Things,* edited by Kenneth Laine Ketner with an Introduction by Hillary Putnam and Kenneth Laine Ketner (Cambridge, Mass.: Harvard University Press, 1992).

[1] Johann Friedrich Herbart (1776–1841), German philosopher and educator, proposing that education could be a science, based on applied psychology. After some vogue in the United States, where it tended to become a rigid formalism, it was later supplanted by ideas of "progressive education," particularly as championed by John Dewey.

up other ideas. For example, I cast my eyes let us say upon an impressionist marine picture, one of those things in which the wet pastels are affixed in blotches nearly as large as the end of your little finger. It has a very disagreeable look and seems very meaningless. But as I gaze upon it I detect myself sniffing the salt-air and holding up my cheek to the sea breeze. That subconscious element of observation is I am strongly inclined to think the very most important of all the constituents of practical reasoning. The other part of observation consists in moulding in the upper consciousness a more or less skeletonized idea until it is felt to respond to [the] object of observation. This last element is quite indispensable if one is trying to form a theory of the object in hand, or even to describe it in words; but it goes a long way toward breaking down, denying, and pooh-poohing away, all the fineness of the subconscious observation. It is, therefore, a great art to be able to suppress it and put it into its proper place in cases where it attempts impertinent intermeddling. Do not allow yourself to be imposed upon by the egotism and conceit of the upper consciousness.

Observation may also be divided into three nearly independent genera according to the different natures of the elements observed. Namely, it may be directed to the qualities of objects or to experiential facts of relation, or to the relations between the parts of an image one's own phantasy has created. These are all observations, composed of the two elements I have mentioned. Nevertheless, they are so far different that in training one kind you do not necessarily strengthen either of the others in any sensible measure. It consequently becomes necessary to train each of these three modes of observation separately.

The qualities which we observe may, in the first place, be sensible qualities, colors, sounds, sizes, shapes, etc. Or, in the second place, they may be secondary, or emotional, qualities, such as the esthetic qualities. A training in discrimination of sensible qualities will affect the power of discriminating emotional qualities in no inconsiderable measure, and *vice versa.* Thirdly, there is observational discrimination of mental states, which in my experience has been found associated with sense discrimination much more frequently than I should have anticipated that it would be.

All these powers are most important in reasoning; and I need hardly say that just as a person who has not frequented a gymnasium or its equivalent can in a single month amazingly bring up the strength of a given set of muscles by means of systematic exercise, so a person whose powers of observational discrimination have been neglected can by analogous exercises attain results quite as surprising.

What Pragmatism Is (1905)

* * *

411. The writer of this article has been led by much experience to believe that every physicist, and every chemist, and, in short, every master in any department of experimental science, has had his mind moulded by his life in the laboratory to a degree that is little suspected. . . .

412. That laboratory life did not prevent the writer (who here and in what follows simply exemplifies the experimentalist type) from becoming interested in methods of thinking; and when he came to read metaphysics, although much of it seemed to him loosely reasoned and determined by accidental prepossessions, yet in the writings of some philosophers, especially Kant, Berkeley, and Spinoza, he sometimes came upon strains of thought that recalled the ways of thinking of the laboratory, so that he felt he might trust to them; all of which has been true of other laboratory-men.

Endeavoring, as a man of that type naturally would, to formulate what he so approved, he framed the theory that a **conception,** that is, the rational purport of a word or other expression, lies exclusively in its conceivable bearing upon the conduct of life; so that, since obviously nothing that might not result from experiment can have any direct bearing upon conduct, if one can define accurately all the conceivable experimental phenomena which the affirmation or denial of a concept could imply, one will have therein a complete definition of the concept, and **there is absolutely nothing more in it.**[1] For this doctrine he invented the name **pragmatism.** Some of his friends wished him to call it **practicism** or **practicalism** (perhaps on the ground that {*praktikos*} is better Greek than {*pragmatikos*}. But for one who had learned philosophy out of Kant, as the writer, along with nineteen out of every twenty experimentalists who have turned to philosophy, had done, and who still thought in Kantian terms most readily, *praktisch* and *pragmatisch* were as far apart as the two poles, the former belonging in a region of thought where no mind of the experimentalist type can ever make sure of solid ground under his feet, the latter expressing relation to some definite human purpose. Now

---

From "What Pragmatism Is" was first published in *The Monist,* vol. 15, 161–81 (1905). Reprinted from *Collected Papers* (Cambridge, Mass.: Harvard University Press, 1921), 5.411–27.

[1] This is commonly known as the "pragmatist maxim."

quite the most striking feature of the new theory was its recognition of an inseparable connection between rational cognition and rational purpose; and that consideration it was which determined the preference for the name pragmatism.

* * *

§3. Pragmaticism

414. After awaiting in vain, for a good many years, some particularly opportune conjuncture of circumstances that might serve to recommend his notions of the ethics of terminology, the writer has now, at last, dragged them in over head and shoulders, on an occasion when he has no specific proposal to offer nor any feeling but satisfaction at the course usage has run without any canons or resolutions of a congress. His word "pragmatism" has gained general recognition in a generalized sense that seems to argue power of growth and vitality. The famed psychologist, James, first took it up,[2] seeing that his "radical empiricism" substantially answered to the writer's definition of pragmatism, albeit with a certain difference in the point of view. Next, the admirably clear and brilliant thinker, Mr. Ferdinand C.S. Schiller, casting about for a more attractive name for the "anthropomorphism" of his *Riddle of the Sphinx,* lit, in that most remarkable paper of his on *Axioms as Postulates,*[3] upon the same designation "pragmatism," which in its original sense was in generic agreement with his own doctrine, for which he has since found the more appropriate specification "humanism," while he still retains "pragmatism" in a somewhat wider sense. So far all went happily. But at present, the word begins to be met with occasionally in the literary journals, where it gets abused in the merciless way that words have to expect when they fall into literary clutches. . . . So then, the writer, finding his bantling "pragmatism" so promoted, feels that it is time to kiss his child good-by and relinquish it to its higher destiny; while to serve the precise purpose of expressing the original definition, he begs to announce the birth of the word "pragmaticism," which is ugly enough to be safe from kidnappers.[4]

415. Much as the writer has gained from the perusal of what other pragmatists have written, he still thinks there is a decisive advantage in his original conception of the doctrine. From this original form every truth that follows from any of the other forms can be deduced, while some errors can be avoided into which other pragmatists have fallen. The original view appears, too, to be a more compact and unitary conception than the others. But its capital merit, in the writer's eyes, is that it more readily connects itself with a critical proof of its truth. . . .

416. The bare definition of pragmaticism could convey no satisfactory comprehension of it to the most apprehensive of minds, but requires the commentary to be given below. Moreover, this definition takes no notice of one or two other doctrines without the previous acceptance (or virtual acceptance) of which pragmaticism itself would be a nullity. They are included as a part of the pragmatism of Schiller, but the present writer prefers not to mingle different propositions. The preliminary propositions had better be stated forthwith.

The difficulty in doing this is that no formal list of them has ever been made. They might all be included under the vague maxim, "Dismiss make-believes." Philosophers of very diverse stripes propose that philosophy shall take its start from one or another state of mind in which no man, least of all a beginner in philosophy, actually is. One proposes that you shall begin by doubting everything, and says that there is only one thing that you cannot doubt, as if doubting were "as easy as lying." Another proposes that we should begin by observing "the first impressions of sense," forgetting that our very percepts are the results of cognitive elaboration.[5] But in truth, there is but one state of mind from which you can "set out," namely, the very state of mind in which you actually find yourself at the time you do "set out"—a state in which you are laden with an immense mass of cognition already formed, of which you cannot divest yourself if you would; and who knows whether, if you could, you would not have made all knowledge impossible to yourself? Do you call it doubting to write down on a piece of paper that you doubt? If so, doubt has nothing to do with any serious business. But do not make believe; if pedantry has not eaten all the reality out of you, recognize, as you must, that there is much that you do not doubt, in the least. Now that which you do not at all doubt, you must and do regard as infallible, absolute truth. Here breaks in Mr. Make Believe: "What! Do you mean to say that one is to believe what is not true, or that what a man does not doubt is ipso facto true?" No, but unless he can make a thing white and black at once, he has to regard what he does not doubt as absolutely true. Now you, *per hypothesiu,* are that man.

---

[2] [Peirce] See his [William James's] *Pragmatism,* p. 47.

[3] Ferdinand C. S. Schiller (1864–1937), British philosopher; see his *Personal Idealism* (1902), ed. by H. Sturt, p. 63.

[4] [Peirce] To show how recent the general use of the word "pragmatism" is, the writer may mention that, to the best of his belief, he never used it in copy for the press before today, except by particular request, in *Baldwin's Dictionary.* [See 1-4.] Toward the end of 1890, when this part of the *Century Dictionary* appeared, he did not deem that the word had sufficient status to appear in that work. [But see 13n.] But he has used it continually in philosophical conversation since, perhaps, the mid-seventies.

[5] Peirce is alluding to René Descartes and John Locke (above, page 281). See his "Concerning Certain Faculties Claimed for Man" and "The Fixation of Belief" in *The Essential Peirce,* vol. 1.

"But you tell me there are scores of things I do not doubt. I really cannot persuade myself that there is not some one of them about which I am mistaken." You are adducing one of your make-believe facts, which, even if it were established, would only go to show that doubt has a *limen,* that is, is only called into being by a certain finite stimulus. You only puzzle yourself by talking of this metaphysical "truth" and metaphysical "falsity," that you know nothing about. All you have any dealings with are your doubts and beliefs,[6] with the course of life that forces new beliefs upon you and gives you power to doubt old beliefs. If your terms "truth" and "falsity" are taken in such senses as to be definable in terms of doubt and belief and the course of experience (as for example they would be, if you were to define the "truth" as that to a belief in which belief would tend if it were to tend indefinitely toward absolute fixity), well and good: in that case, you are only talking about doubt and belief. But if by truth and falsity you mean something not definable in terms of doubt and belief in any way, then you are talking of entities of whose existence you can know nothing, and which Ockham's razor would clean shave off. Your problems would be greatly simplified, if, instead of saying that you want to know the "Truth," you were simply to say that you want to attain a state of belief unassailable by doubt.

417. Belief is not a momentary mode of consciousness; it is a habit of mind essentially enduring for some time, and mostly (at least) unconscious; and like other habits, it is (until it meets with some surprise that begins its dissolution) perfectly self-satisfied. Doubt is of an altogether contrary genus. It is not a habit, but the privation of a habit. Now a privation of a habit, in order to be anything at all, must be a condition of erratic activity that in some way must get superseded by a habit.

418. Among the things which the reader, as a rational person, does not doubt, is that he not merely has habits, but also can exert a measure of self-control over his future actions; which means, however, not that he can impart to them any arbitrarily assignable character, but, on the contrary, that a process of self-preparation will tend to impart to action (when the occasion for it shall arise), one fixed character, which is indicated and perhaps roughly measured by the absence (or slightness) of the feeling of self-reproach, which subsequent reflection will induce. Now, this subsequent reflection is part of the self-preparation for action on the next occasion. Consequently, there is a tendency, as action is repeated again and again, for the action to approximate indefinitely toward the perfection of that fixed character, which would be marked by entire absence of self-reproach. The more closely this is approached, the less room for self-control there will be; and where no self-control is possible there will be no self-reproach.

419. These phenomena seem to be the fundamental characteristics which distinguish a rational being. Blame, in every case, appears to be a modification, often accomplished by a transference, or "projection," of the primary feeling of self-reproach. Accordingly, we never blame anybody for what had been beyond his power of previous self-control. Now, thinking is a species of conduct which is largely subject to self-control. In all their features (which there is no room to describe here), logical self-control is a perfect mirror of ethical self-control—unless it be rather a species under that genus. In accordance with this, what you cannot in the least help believing is not, justly speaking, wrong belief. In other words, for you it is the absolute truth. True, it is conceivable that what you cannot help believing today, you might find you thoroughly disbelieve tomorrow. But then there is a certain distinction between things you "cannot" do, merely in the sense that nothing stimulates you to the great effort and endeavors that would be required, and things you cannot do because in their own nature they are insusceptible of being put into practice. In every stage of your excogitations, there is something of which you can only say, "I cannot think otherwise," and your experientially based hypothesis is that the impossibility is of the second kind.

420. There is no reason why "thought," in what has just been said, should be taken in that narrow sense in which silence and darkness are favorable to thought. It should rather be understood as covering all rational life, so that an experiment shall be an operation of thought. Of course, that ultimate state of habit to which the action of self-control ultimately tends, where no room is left for further self-control, is, in the case of thought, the state of fixed belief, or perfect knowledge.

421. Two things here are all-important to assure oneself of and to remember. The first is that a person is not absolutely an individual. His thoughts are what he is "saying to himself," that is, is saying to that other self that is just coming into life in the flow of time. When one reasons, it is that critical self that one is trying to persuade; and all thought whatsoever is a sign, and is mostly of the nature of language. The second thing to remember is that the man's circle of society (however widely or narrowly this phrase may be understood), is a sort of loosely compacted person, in some respects of higher rank than the person of an indi-

---

[6] [Peirce] It is necessary to say that "belief" is throughout used merely as the name of the contrary to doubt, without regard to grades of certainty nor to the nature of the proposition held for true, i.e., "believed."

vidual organism. It is these two things alone that render it possible for you—but only in the abstract, and in a Pickwickian sense[7]—to distinguish between absolute truth and what you do not doubt.

422. Let us now hasten to the exposition of pragmaticism itself. Here it will be convenient to imagine that somebody to whom the doctrine is new, but of rather preternatural perspicacity, asks questions of a pragmaticist. Everything that might give a dramatic illusion must be stripped off, so that the result will be a sort of cross between a dialogue and a catechism, but a good deal liker the latter—something rather painfully reminiscent of Mangnall's *Historical Questions.*[8]

Questioner: I am astounded at your definition of your pragmatism, because only last year I was assured by a person above all suspicion of warping the truth—himself a pragmatist—that your doctrine precisely was "that a conception is to be tested by its practical effects." You must surely, then, have entirely changed your definition very recently.

Pragmatist: If you will turn to Vols. VI and VII of the *Revue Philosophique,* or to the *Popular Science Monthly* for November 1877 and January 1878 [Papers No. IV and V], you will be able to judge for yourself whether the interpretation you mention was not then clearly excluded. The exact wording of the English enunciation, (changing only the first person into the second), was: "Consider what effects that might conceivably have practical bearing you conceive the object of your conception to have. Then your conception of those effects is the WHOLE of your conception of the object."[9]

Questioner: Well, what reason have you for asserting that this is so?

Pragmatist: That is what I specially desire to tell you. But the question had better be postponed until you clearly understand what those reasons profess to prove.

423. *Questioner:* What, then, is the *raison d'être* of the doctrine? What advantage is expected from it?

Pragmatist: It will serve to show that almost every proposition of ontological metaphysics is either meaningless gibberish[10]—one word being defined by other words, and they by still others, without any real conception ever being reached—or else is downright absurd; so that all such rubbish being swept away, what will remain of philosophy will be a series of problems capable of investigation by the observational methods of the true sciences—the truth about which can be reached without those interminable misunderstandings and disputes which have made the highest of the positive sciences a mere amusement for idle intellects, a sort of chess—idle pleasure its purpose, and reading out of a book its method. In this regard, pragmaticism is a species of prope-positivism. But what distinguishes it from other species is, first, its retention of a purified philosophy; secondly, its full acceptance of the main body of our instinctive beliefs; and thirdly, its strenuous insistence upon the truth of scholastic realism (or a close approximation to that, well-stated by the late Dr. Francis Ellingwood Abbot[11] in the Introduction to his *Scientific Theism*). So, instead of merely jeering at metaphysics, like other prope-positivists, whether by long drawn-out parodies or otherwise, the pragmaticist extracts from it a precious essence, which will serve to give life and light to cosmology and physics. At the same time, the moral applications of the doctrine are positive and potent; and there are many other uses of it not easily classed. On another occasion, instances may be given to show that it really has these effects.

424. *Questioner:* I hardly need to be convinced that your doctrine would wipe out metaphysics. Is it not as obvious that it must wipe out every proposition of science and everything that bears on the conduct of life? For you say that the only meaning that, for you, any assertion bears is that a certain experiment has resulted in a certain way: Nothing else but an experiment enters into the meaning. Tell me, then, how can an experiment, in itself, reveal anything more than that something once happened to an individual object and that subsequently some other individual event occurred?

Pragmatist: That question is, indeed, to the purpose—the purpose being to correct any misapprehensions of pragmaticism. You speak of an experiment in itself, emphasising "in itself." You evidently think of each experiment as isolated from every other. It has not, for example, occurred to you, one might venture to surmise, that every connected series of experiments constitutes a single collective experiment. What are the essential ingredients of an experiment? First, of course, an experimenter of flesh and blood. Secondly, a verifiable hypothesis. This is a proposition[12] relating to the universe environing the experimenter, or to some well-known part of it and affirming or denying of this only some experimental possibility or impossibility. The third indispensable ingredient is a sincere doubt in the experimenter's mind as to the truth of that hypothesis.

---

[7] An expression meant in an idiosyncratic or unusual way, after Mr. Pickwick, in Charles Dickens's *The Pickwick Papers* (1837).

[8] Peirce is most likely referring to *Historical Questions from the Bible, with Answers. Written for the Mendip Schools* (1798).

[9] Cf. *Collected Papers* 5.402.

[10] Cf. Carnap (below, page 978).

[11] Francis Ellingwood Abbot (1836–1903), American philosopher and Doctor of Divinity from Harvard; associated with Free Religionist movement, and forced to leave his Unitarian ministry in Dover, New Hampshire.

[12] [Peirce] The writer, like most English logicians, invariably uses the word proposition not as the Germans define their equivalent, Satz, as the language-expression of a judgment *(Urtheil),* but as that which is related to any assertion, whether mental and self-addressed or outwardly expressed, just as any possibility is related to its actualisation. The difficulty of the, at best, difficult problem of the essential nature of a Proposition has been increased, for the Germans, by their *Urtheil,* confounding, under one designation, the mental assertion with the assertible [cf. *Collected Papers* 2.315].

Passing over several ingredients on which we need not dwell, the purpose, the plan, and the resolve, we come to the act of choice by which the experimenter singles out certain identifiable objects to be operated upon. The next is the external (or quasi-external) ACT by which he modifies those objects. Next, comes the subsequent reaction of the world upon the experimenter in a perception; and finally, his recognition of the teaching of the experiment. While the two chief parts of the event itself are the action and the reaction, yet the unity of essence of the experiment lies in its purpose and plan, the ingredients passed over in the enumeration.

425. Another thing: in representing the pragmaticist as making rational meaning to consist in an experiment (which you speak of as an event in the past), you strikingly fail to catch his attitude of mind. Indeed, it is not in an experiment, but in experimental phenomena, that rational meaning is said to consist. When an experimentalist speaks of a phenomenon, such as "Hall's phenomenon,"[13] "Zeemann's phenomenon"[14] and its modification, "Michelson's phenomenon,"[15] or "the chessboard phenomenon," he does not mean any particular event that did happen to somebody in the dead past, but what surely will happen to everybody in the living future who shall fulfill certain conditions. The phenomenon consists in the fact that when an experimentalist shall come to act according to a certain scheme that he has in mind, then will something else happen, and shatter the doubts of sceptics, like the celestial fire upon the altar of Elijah.

426. And do not overlook the fact that the pragmaticist maxim says nothing of single experiments or of single experimental phenomena (for what is conditionally true in futuro can hardly be singular), but only speaks of general kinds of experimental phenomena. Its adherent does not shrink from speaking of general objects as real, since whatever is true represents a real. Now the laws of nature are true.

427. The rational meaning of every proposition lies in the future. How so? The meaning of a proposition is itself a proposition. Indeed, it is no other than the very proposition of which it is the meaning: it is a translation of it. But of the myriads of forms into which a proposition may be translated, what is that one which is to be called its very meaning? It is, according to the pragmaticist, that form in which the proposition becomes applicable to human conduct, not in these or those special circumstances, nor when one entertains this or that special design, but that form which is most directly applicable to self-control under every situation, and to every purpose. This is why he locates the meaning in future time; for future conduct is the only conduct that is subject to self-control. But in order that that form of the proposition which is to be taken as its meaning should be applicable to every situation and to every purpose upon which the proposition has any bearing, it must be simply the general description of all the experimental phenomena which the assertion of the proposition virtually predicts. For an experimental phenomenon is the fact asserted by the proposition that action of a certain description will have a certain kind of experimental result; and experimental results are the only results that can affect human conduct. No doubt, some unchanging idea may come to influence a man more than it had done; but only because some experience equivalent to an experiment has brought its truth home to him more intimately than before. Whenever a man acts purposively, he acts under a belief in some experimental phenomenon. Consequently, the sum of the experimental phenomena that a proposition implies makes up its entire bearing upon human conduct. Your question, then, of how a pragmaticist can attribute any meaning to any assertion other than that of a single occurrence is substantially answered. . . .

---

[13] The "Hall effect," discovered in 1879 by Edwin Herbert Hall, American physicist, designates the development of a transverse electrical field in a solid conductor when exposed to a magnetic field perpendicular to the current flow.

[14] Or the "Zeeman effect," named after Pieter Zeeman (1865–1943), awarded the Nobel Prize for physics in 1902 with Hendrik A. Lorentz. The Zeeman effect was the discovery that each of the lines of the spectrum of emitted light subjected to a magnetic field split into several lines of slightly different frequency.

[15] Refers to experiments with the interferometer, developed by Albert A. Michelson (1852–1931), for measuring the speed of light; cf. the Michelson-Morley experiment in 1887, proving that there was no movement of the earth relative to the celestial ether—hence proving that there was no ether.

Walt Whitman

1819–1892

Walt Whitman, though known almost exclusively for his poetry, began his career as a journalist with a strong interest in political reporting and cultural commentary. *Democratic Vistas* is his longest prose work, arguing vigorously for a pervasive connection between literature, primarily poetry, and the shaping of the character of individuals and their culture. Drawing inspiration from the great writers of the Romantic era, but especially from Ralph Waldo Emerson, Whitman, like Shelley, argues for a social, cultural, and political role for the poet as not just the "unacknowledged legislator" of mankind, but as the essential formative influence for shaping the future of democracy. While Hippolyte Taine (above, page 639) argues that the literary history of a nation reflects its character, Whitman, in a somewhat prophetic mode, argues that poetry is what *builds* the character of a civilization.

Like his poetry in *Leaves of Grass,* which expanded under the same title year after year, *Democratic Vistas* is an unconventional essay that lays out and elaborates upon three fundamental and connected points. The first is that the emergence of Democracy, not just as a political theory but as a cultural ideal, derives from the principle that the individual is, as he puts it, "a law, or series of laws unto himself," and must be taught to be self-governing. Drawing from Emerson's principle of self-reliance, and echoing Kant's essay, "What Is Enlightenment?" which defines that concept as the struggle to reach a state of true self-governance and autonomy, Whitman's doctrine of "personalism" posits that the modern age, the natural successor to feudalism, has no choice but to focus on the identity and potential of individuals, without discrimination, as the ultimate source of political legitimacy. The second point is that all of the arts, but especially poetry, are the primary training ground for self-discovery and growth, which must be attended to with more scrupulous attention than the two other conditions of democracy he identifies: the distrubution of economic wealth, and the legislative provision of a free and universal franchise. The role of poetry, for Whitman, lies in the cultural work of attempting to find unity in the midst of what he terms "irreconcilable interiors." The third point is that the reading of poetry is too important to be left as the leisure activity of what he sharply characterizes as "supercilious infidels" but should be, on the contrary, "a gymnast's struggle" to construe the hints and framework provided by poetic expression. As he puts it, "Not the book needs so much to be the complete thing, but the reader of the book does. That were to make a nation of supple and athletic minds, well-train'd, intuitive, used to depend on themselves and not on a few coteries of writers."

For this volume, *Democratic Vistas* has been considerably shortened by the removal of much material that focuses on particular observations about American cultural and political life in the aftermath of the Civil War. It is notable that despite Whitman's own urging that this essay, *Leaves of Grass,* and especially "Song of Myself" were his most important works, *Democratic Vistas* has frequently been left out of literary anthologies and editions of Whitman, perhaps because of its somewhat desultory style and thematic expansiveness. In the context of modern literary criticism and theory, however, Whitman's argument provides a very provocative link between the theorizing of Romantic writers such as Blake, Schiller, Coleridge, Shelley, and Emerson, and later movements in literary study that, in a practical vein, set about to create the schools and the pedagogy to teach poetry to all students, even when the teachers may not have been particularly sympathetic to Whitman.

The most convenient collected edition of Whitman's poetry and prose is *Walt Whitman: Complete Poetry and Collected Prose* (New York: The Library of America, 1982). For general guidance in the study of Whitman, the revised edition of Gay Wilson Allen's *The New Walt Whitman Handbook* (1975; reissued, 1986) is still extremely valuable. See also E. Fred Carlisle, *The Uncertain Self: Whitman's Drama of Identity* (1973); Paul Zweig, *Walt Whitman: The Making of the Poet* (1984); Betsy Erkkila, *Whitman the Political Poet* (1989); M. Jimmie Killingsworth, *Whitman's Poetry of the Body: Sexuality, Politics, and the Text* (1989); Ezra Greenspan, *Walt Whitman and the American Reader* (1990), and *The Cambridge Companion to Walt Whitman* (1995); Roger Asselineau, *The Evolution of Walt Whitman* (1999); Mark Maslan, *Whitman Possessed: Poetry, Sexuality, and Popular Authority* (2001); Ed Folsom, ed., *Whitman East and West: New Contexts for Reading Whitman* (2002).

Democratic Vistas (1871)

As the greatest lessons of Nature through the universe are perhaps the lessons of variety and freedom, the same present the greatest lessons also in New World politics and progress. If a man were ask'd, for instance, the distinctive points contrasting modern European and American political and other life with the old Asiatic cultus, as lingering-bequeath'd yet in China and Turkey, he might find the amount of them in John Stuart Mill's profound essay on Liberty[1] in the future, where he demands two main constituents, or sub-strata, for a truly grand nationality—1st, a large variety of character—and 2d, full play for human nature to expand itself in numberless and even conflicting directions. . . .

For our New World I consider far less important for what it has done, or what it is, than for results to come. Sole among nationalities, these States have assumed the task to put in forms of lasting power and practicality . . . the theory of development and perfection by voluntary standards, and self-reliance. Who else, indeed, except the United States, in history, so far, have accepted in unwitting faith, . . . [to] stand, act upon, and go security for, these things? . . .

I will not gloss over the appalling dangers of universal suffrage in the United States. In fact, it is to admit and face these dangers I am writing. To him or her within whose thought rages the battle, advancing, retreating, between democracy's convictions, aspirations, and the people's crudeness, vice, caprices, I mainly write this essay. I shall use the words America and democracy as convertible terms. Not an ordinary one is the issue. The United States are destined either to surmount the gorgeous history of feudalism, or else prove the most tremendous failure of time. . . .

I say that democracy can never prove itself beyond cavil, until it founds and luxuriantly grows its own forms of art, poems, schools, theology, displacing all that exists, or that has been produced anywhere in the past, under opposite influences. It is curious to me that while so many voices, pens, minds, in the press, lecture-rooms, in our Congress, &c., are discussing intellectual topics, pecuniary dangers, legislative problems, the suffrage, tariff and labor questions, and the various business and benevolent needs of America, with propositions, remedies, often worth deep attention, there is one need, a hiatus the profoundest, that no eye seems to perceive, no

---

Democratic Vistas was completed in 1870, was first published in 1871, and was included in Whitman's *Complete Prose Works* (1892). The original essay includes prose written at several different times. This selection indicates with ellipses where material has been removed. For a convenient full edition see Walt Whitman, *Complete Poetry and Collected Prose* (New York: Library of America, 1982). Whitman's spelling has been retained.

[1] John Stuart Mill (1806–1873), English philosopher and writer, author of *On Liberty* (1859).

voice to state. Our fundamental want to-day in the United States, with closest, amplest reference to present conditions, and to the future, is of a class, and the clear idea of a class, of native authors, literatures, far different, far higher in grade than any yet known, sacerdotal, modern, fit to cope with our occasions, lands, permeating the whole mass of American mentality, taste, belief, breathing into it a new breath of life. . . .

View'd, to-day, from a point of view sufficiently overarching, the problem of humanity all over the civilized world is social and religious, and is to be finally met and treated by literature. The priest departs, the divine literatus comes. Never was anything more wanted than, to-day, and here in the States, the poet of the modern is wanted, or the great literatus of the modern. At all times, perhaps, the central point in any nation, and that whence it is itself really sway'd the most, and whence it sways others, is its national literature, specially its archetypal poems. Above all previous lands, a great original literature is surely to become the justification and reliance, (in some respects the sole reliance,) of American democracy.

Few are aware how the great literature penetrates all, gives hue to all, shapes aggregates and individuals, and, after subtle ways, with irresistible power, constructs, sustains, demolishes at will. Why tower, in reminiscence, above all the nations of the earth, two special lands, petty in themselves, yet inexpressibly gigantic, beautiful, columnar? Immortal Judah lives, and Greece immortal lives, in a couple of poems.

Nearer than this. It is not generally realized, but it is true, as the genius of Greece, and all the sociology, personality, politics and religion of those wonderful states, resided in their literature or esthetics, that what was afterwards the main support of European chivalry, the feudal, ecclesiastical, dynastic world over there—forming its osseous structure, holding it together for hundreds, thousands of years, preserving its flesh and bloom, giving it form, decision, rounding it out, and so saturating it in the conscious and unconscious blood, breed, belief, and intuitions of men, that it still prevails powerful to this day, in defiance of the mighty changes of time—was its literature, permeating to the very marrow, especially that major part, its enchanting songs, ballads, and poems. . . .

In short, as, though it may not be realized, it is strictly true, that a few first-class poets, philosophs, and authors, have substantially settled and given status to the entire religion, education, law, sociology, &c., of the hitherto civilized world, by tinging and often creating the atmospheres out of which they have arisen, such also must stamp, and more than ever stamp, the interior and real democratic construction of this American continent, to-day, and days to come. . . . [I]n the civilization of to-day it is undeniable that, over all the arts, literature dominates, serves beyond all—shapes the character of church and school—or, at any rate, is capable of doing so. Including the literature of science, its scope is indeed unparallel'd.

* * *

For my part, I would alarm and caution even the political and business reader, and to the utmost extent, against the prevailing delusion that the establishment of free political institutions, and plentiful intellectual smartness, with general good order, physical plenty, industry, &c., (desirable and precious advantages as they all are,) do, of themselves, determine and yield to our experiment of democracy the fruitage of success. With such advantages at present fully, or almost fully, possess'd—the Union just issued, victorious, from the struggle with the only foes it need ever fear, (namely, those within itself, the interior ones,) and with unprecedented materialistic advancement—society, in these States, is canker'd, crude, superstitious, and rotten. Political, or law-made society is, and private, or voluntary society, is also. In any vigor, the element of the moral conscience, the most important, the verteber to State or man, seems to me either entirely lacking, or seriously enfeebled or ungrown. . . . In vain have we annex'd Texas, California, Alaska, and reach north for Canada and south for Cuba. It is as if we were somehow being endow'd with a vast and more and more thoroughly-appointed body, and then left with little or no soul.

* * *

First, let us see what we can make out of a brief, general, sentimental consideration of political democracy, and whence it has arisen, with regard to some of its current features, as an aggregate, and as the basic structure of our future literature and authorship. We shall, it is true, quickly and continually find the origin-idea of the singleness of man, individualism, asserting itself, and cropping forth, even from the opposite ideas. But the mass, or lump character, for imperative reasons, is to be ever carefully weigh'd, borne in mind, and provided for. Only from it, and from its proper regulation and potency, comes the other, comes the chance of individualism. The two are contradictory, but our task is to reconcile them.[2]

---

[2] [Whitman] The question hinted here is one which time only can answer. Must not the virtue of modern Individualism, continually enlarging, usurping all, seriously affect, perhaps keep down entirely, in America, the like of the ancient virtue of Patriotism, the fervid and absorbing love of general country? I have no doubt myself that the two will merge, and will mutually profit and brace each other, and that from them a greater product, a third, will arise. But I feel that at present they and their oppositions form a serious problem and paradox in the United States.

The political history of the past may be summ'd up as having grown out of what underlies the words, order, safety, caste, and especially out of the need of some prompt deciding authority, and of cohesion at all cost. Leaping time, we come to the period within the memory of people now living, when, as from some lair where they had slumber'd long, accumulating wrath, sprang up and are yet active, (1790, and on even to the present, 1870,) those noisy eructations, destructive iconoclasms, a fierce sense of wrongs, amid which moves the form, well known in modern history, in the old world, stain'd with much blood, and mark'd by savage reactionary clamors and demands. These bear, mostly, as on one inclosing point of need.

For after the rest is said ... it remains to bring forward and modify everything else with the idea of that Something a man is, (last precious consolation of the drudging poor,) standing apart from all else, divine in his own right, and a woman in hers, sole and untouchable by any canons of authority, or any rule derived from precedent, state-safety, the acts of legislatures, or even from what is called religion, modesty, or art. ... This idea of perfect individualism it is indeed that deepest tinges and gives character to the idea of the aggregate. For it is mainly or altogether to serve independent separatism that we favor a strong generalization, consolidation. As it is to give the best vitality and freedom to the rights of the States, (every bit as important as the right of nationality, the union,) that we insist on the identity of the Union at all hazards.

The purpose of democracy—supplanting old belief in the necessary absoluteness of establish'd dynastic rulership, temporal, ecclesiastical, and scholastic, as furnishing the only security against chaos, crime, and ignorance—is, ... to illustrate, at all hazards, this doctrine or theory that man, properly train'd in sanest, highest freedom, may and must become a law, and series of laws, unto himself, surrounding and providing for, not only his own personal control, but all his relations to other individuals, and to the State; and that, while other theories, as in the past histories of nations, have proved wise enough, and indispensable perhaps for their conditions, this, as matters now stand in our civilized world, is the only scheme worth working from, as warranting results like those of Nature's laws, reliable, when once establish'd, to carry on themselves. ...

As to the political section of Democracy, which introduces and breaks ground for further and vaster sections, few probably are the minds, even in these republican States, that fully comprehend the aptness of that phrase, "THE GOVERNMENT OF THE PEOPLE, BY THE PEOPLE, FOR THE PEOPLE," which we inherit from the lips of Abraham Lincoln; a formula whose verbal shape is homely wit, but whose scope includes both the totality and all minutiae of the lesson.

The People! Like our huge earth itself, which, to ordinary scansion, is full of vulgar contradictions and offence, man, viewed in the lump, displeases, and is a constant puzzle and affront to the merely educated classes. The rare, cosmical, artist-mind, lit with the Infinite, alone confronts his manifold and oceanic qualities—but taste, intelligence and culture, (so-called,) have been against the masses, and remain so. There is plenty of glamour about the most damnable crimes and hoggish meannesses, special and general, of the feudal and dynastic world over there, with its personnel of lords and queens and courts, so well-dress'd and so handsome. But the People are ungrammatical, untidy, and their sins gaunt and ill-bred.

Literature, strictly consider'd, has never recognized the People, and, whatever may be said, does not today. Speaking generally, the tendencies of literature, as hitherto pursued, have been to make mostly critical and querulous men. It seems as if, so far, there were some natural repugnance between a literary and professional life, and the rude rank spirit of the democracies. There is, in later literature, a treatment of benevolence, a charity business, rife enough it is true; but I know nothing more rare, even in this country, than a fit scientific estimate and reverent appreciation of the People—of their measureless wealth of latent power and capacity, their vast, artistic contrasts of lights and shades—with, in America, their entire reliability in emergencies, and a certain breadth of historic grandeur, of peace or war, far surpassing all the vaunted samples of book-heroes, or any *haut-ton* coteries, in all the records of the world.

* * *

I myself see clearly enough the crude, defective streaks in all the strata of the common people; the specimens and vast collections of the ignorant, the credulous, the unfit and uncouth, the incapable, and the very low and poor. The eminent person just mention'd sneeringly asks whether we expect to elevate and improve a nation's politics by absorbing such morbid collections and qualities therein.[3] The point is a formidable one, and there will doubtless always be numbers of solid and reflective citizens who will never get over it. Our answer is general, and is involved in the scope and letter of this essay. We believe the ulterior object of political and all other government, ... to be ... not merely to rule, to repress disorder, &c., but to develop, to open up to cultivation, to encourage the possibilities of all beneficent and manly outcroppage, and of that aspiration for independence, and the pride and self-respect latent in all characters. . . .

---

[3] Whitman refers to Thomas Carlyle (1795–1881), English writer, specifically, his essay, "Shooting Niagara." Carlyle was extremely skeptical of the value of democracy (as compared with what he and Whitman characterize as feudalism) and was particularly ascerbic on the subject of the American Civil War.

I say the mission of government, henceforth, in civilized lands, is not repression alone, and not authority alone, not even of law, nor by that favorite standard of the eminent writer, the rule of the best men, the born heroes and captains of the race, (as if such ever, or one time out of a hundred, get into the big places, elective or dynastic)—but higher than the highest arbitrary rule, to train communities through all their grades, beginning with individuals and ending there again, to rule themselves. . . .

. . . For it is not that democracy is of exhaustive account, in itself. Perhaps, indeed, it is, (like Nature,) of no account in itself. It is that, as we see, it is the best, ... trainer, for the million, not for grand material personalities only, but for immortal souls. To be a voter with the rest is not so much; and this, like every institute, will have its imperfections. But to become an enfranchised man, and now, impediments removed, to stand and start without humiliation, and equal with the rest; to commence, or have the road clear'd to commence, the grand experiment of development, whose end, (perhaps requiring several generations,) may be the forming of a full-grown man or woman—that is something. . . .

We do not, (at any rate I do not,) put it either on the ground that the People, the masses, even the best of them, are, in their latent or exhibited qualities, essentially sensible and good—nor on the ground of their rights; but that good or bad, rights or no rights, the democratic formula is the only safe and preservative one for coming times. We endow the masses with the suffrage for their own sake, no doubt; then, perhaps still more, from another point of view, for community's sake. Leaving the rest to the sentimentalists, we present freedom as sufficient in its scientific aspect, cold as ice, reasoning, deductive, clear and passionless as crystal.

Democracy too is law, and of the strictest, amplest kind. Many suppose, (and often in its own ranks the error,) that it means a throwing aside of law, and running riot. But, briefly, it is the superior law, not alone that of physical force, the body, which, adding to, it supersedes with that of the spirit. . . . Nor is the esthetic point, always an important one, without fascination for highest aiming souls. The common ambition strains for elevations, to become some privileged exclusive. The master sees greatness and health in being part of the mass; nothing will do as well as common ground. Would you have in yourself the divine, vast, general law? Then merge yourself in it.

And, topping democracy, this most alluring record, that it alone can bind, and ever seeks to bind, all nations, all men, of however various and distant lands, into a brotherhood, a family. It is the old, yet ever-modern dream of earth, out of her eldest and her youngest, her fond philosophers and poets. Not that half only, individualism, which isolates. There is another half, which is adhesiveness or love, that fuses, ties and aggregates, making the races comrades, and fraternizing all. Both are to be vitalized by religion, (sole worthiest elevator of man or State,) breathing into the proud, material tissues, the breath of life. For I say at the core of democracy, finally, is the religious element. All the religions, old and new, are there. Nor may the scheme step forth, clothed in resplendent beauty and command, till these, bearing the best, the latest fruit, the spiritual, shall fully appear.

A portion of our pages we might indite with reference toward Europe, especially the British part of it, more than our own land, perhaps not absolutely needed for the home reader. But the whole question hangs together, and fastens and links all peoples. The liberalist of to-day has this advantage over antique or medieval times, that his doctrine seeks not only to individualize but to universalize. The great word Solidarity has arisen. Of all dangers to a nation, as things exist in our day, there can be no greater one than having certain portions of the people set off from the rest by a line drawn—they not privileged as others, but degraded, humiliated, made of no account. . . .

And, truly, whatever may be said in the way of abstract argument, for or against the theory of a wider democratizing of institutions in any civilized country, much trouble might well be saved to all European lands by recognizing this palpable fact, (for a palpable fact it is,) that some form of such democratizing is about the only resource now left. That, or chronic dissatisfaction continued, mutterings which grow annually louder and louder, till, in due course, and pretty swiftly in most cases, the inevitable crisis, crash, dynastic ruin. Anything worthy to be call'd statesmanship in the Old World, . . . does not debate to-day whether to hold on, attempting to lean back and monarchize, or to look forward and democratize—but how, and in what degree and part, most prudently to democratize.

* * *

The true gravitation-hold of liberalism in the United States will be a more universal ownership of property, general homesteads, general comfort—a vast, intertwining reticulation of wealth. As the human frame, or, indeed, any object in this manifold universe, is best kept together by the simple miracle of its own cohesion, and the necessity, exercise and profit thereof, so a great and varied nationality, occupying millions of square miles, were firmest held and knit by the principle of the safety and endurance of the aggregate of its middling property owners. So that, from another point of view, ungracious as it may sound, and a paradox after what we have been saying, democracy looks with suspicious, ill-satisfied eye upon the very poor, the ignorant, and on those out of business. She asks for men and women with occupations, well-off, owners of houses and acres, and with cash in the bank—and with some cravings for literature, too; and must have them, and hastens to make them. Luckily, the seed is already well-sown, and has taken ineradicable root. . . .

Political democracy, as it exists and practically works in America, with all its threatening evils, supplies a training-school for making first-class men. It is life's gymnasium, not of good only, but of all. We try often, though we fall back often. A brave delight, fit for freedom's athletes, fills these arenas, and fully satisfies, out of the action in them, irrespective of success. Whatever we do not attain, we at any rate attain the experiences of the fight, the hardening of the strong campaign, and throb with currents of attempt at least. Time is ample. Let the victors come after us. Not for nothing does evil play its part among us. Judging from the main portions of the history of the world, so far, justice is always in jeopardy, peace walks amid hourly pitfalls, and of slavery, misery, meanness, the craft of tyrants and the credulity of the populace, in some of their protean forms, no voice can at any time say, They are not. The clouds break a little, and the sun shines out—but soon and certain the lowering darkness falls again, as if to last forever. Yet is there an immortal courage and prophecy in every sane soul that cannot, must not, under any circumstances, capitulate. *Vive,* the attack—the perennial assault! *Vive,* the unpopular cause—the spirit that audaciously aims—the never-abandon'd efforts, pursued the same amid opposing proofs and precedents.

Once, before the war, (Alas! I dare not say how many times the mood has come!) I, too, was fill'd with doubt and gloom. A foreigner, an acute and good man, had impressively said to me, that day—putting in form, indeed, my own observations: "I have travel'd much in the United States, and watch'd their politicians, and listen'd to the speeches of the candidates, and read the journals, and gone into the public houses, and heard the unguarded talk of men. And I have found your vaunted America honeycomb'd from top to toe with infidelism, even to itself and its own programme. I have mark'd the brazen hell-faces of secession and slavery gazing defiantly from all the windows and doorways. I have everywhere found, primarily, thieves and scalliwags arranging the nominations to offices, and sometimes filling the offices themselves. I have found the north just as full of bad stuff as the south. Of the holders of public office in the Nation or the States or their municipalities, I have found that not one in a hundred has been chosen by any spontaneous selection of the outsiders, the people, but all have been nominated and put through by little or large caucuses of the politicians, and have got in by corrupt rings and electioneering, not capacity or desert. I have noticed how the millions of sturdy farmers and mechanics are thus the helpless supplejacks of comparatively few politicians. And I have noticed more and more, the alarming spectacle of parties usurping the government, and openly and shamelessly wielding it for party purposes."

Sad, serious, deep truths. Yet are there other, still deeper, amply confronting, dominating truths. Over those politicians and great and little rings, and over all their insolence and wiles, and over the powerfulest parties, looms a power, too sluggish may-be, but ever holding decisions and decrees in hand, ready, with stern process, to execute them as soon as plainly needed—and at times, indeed, summarily crushing to atoms the mightiest parties, even in the hour of their pride.

In saner hours far different are the amounts of these things from what, at first sight, they appear. Though it is no doubt important who is elected governor, mayor, or legislator, (and full of dismay when incompetent or vile ones get elected, as they sometimes do,) there are other, quieter contingencies, infinitely more important. Shams, &c., will always be the show, like ocean's scum; enough, if waters deep and clear make up the rest. Enough, that while the piled embroider'd shoddy gaud and fraud spreads to the superficial eye, the hidden warp and weft are genuine, and will wear forever. Enough, in short, that the race, the land which could raise such as the late rebellion, could also put it down.

The average man of a land at last only is important. He, in these States, remains immortal owner and boss, deriving good uses, somehow, out of any sort of servant in office, even the basest; (certain universal requisites, and their settled regularity and protection, being first secured,) a nation like ours, in a sort of geological formation state, trying continually new experiments, choosing new delegations, is not served by the best men only, but sometimes more by those that provoke it—by the combats they arouse. Thus national rage, fury, discussion, &c., better than content. Thus, also, the warning signals, invaluable for after times.

* * *

Then still the thought returns, (like the thread-passage in overtures,) giving the key and echo to these pages. When I pass to and fro, different latitudes, different seasons, beholding the crowds of the great cities, New York, Boston, Philadelphia, Cincinnati, Chicago, St. Louis, San Francisco, New Orleans, Baltimore—when I mix with these interminable swarms of alert, turbulent, good-natured, independent citizens, mechanics, clerks, young persons—at the idea of this mass of men, so fresh and free, so loving and so proud, a singular awe falls upon me. I feel, with dejection and amazement, that among our geniuses and talented writers or speakers, few or none have yet really spoken to this people, created a single image-making work for them, or absorb'd the central spirit and the idiosyncrasies which are theirs—and which, thus, in highest ranges, so far remain entirely uncelebrated, unexpress'd.

Dominion strong is the body's; dominion stronger is the mind's. What has fill'd, and fills to-day our intellect, our fancy, furnishing the standards therein, is yet foreign. The great poems, Shakspere included, are poisonous to the idea of the pride and dignity of the common people, the life-blood of democracy. The models of our literature, as we get it from other lands, ultramarine, have had their birth in courts, and bask'd and grown in castle sunshine; all smells of princes' favors. Of workers of a certain sort, we have, indeed, plenty, contributing after their kind; many elegant, many learn'd, all complacent. But touch'd by the national test, or tried by the standards of democratic personality, they wither to ashes. I say I have not seen a single writer, artist, lecturer, or what not, that has confronted the voiceless but ever erect and active, pervading, underlying will and typic aspiration of the land, in a spirit kindred to itself. Do you call those genteel little creatures American poets? Do you term that perpetual, pistareen, paste-pot work, American art, American drama, taste, verse? I think I hear, echoed as from some mountain-top afar in the west, the scornful laugh of the Genius of these States.

Democracy, in silence, biding its time, ponders its own ideals, not of literature and art only—not of men only, but of women. The idea of the women of America, (extricated from this daze, this fossil and unhealthy air which hangs about the word lady,) develop'd, raised to become the robust equals, workers, and, it may be, even practical and political deciders with the men—greater than man, we may admit, through their divine maternity, always their towering, emblematical attribute—but great, at any rate, as man, in all departments; or, rather, capable of being so, soon as they realize it, and can bring themselves to give up toys and fictions, and launch forth, as men do, amid real, independent, stormy life.

Then, as towards our thought's finalè, (and, in that, overarching the true scholar's lesson,) we have to say there can be no complete or epical presentation of democracy in the aggregate, or anything like it, at this day, because its doctrines will only be effectually incarnated in any one branch, when, in all, their spirit is at the root and centre. Far, far, indeed, stretch, in distance, our Vistas! How much is still to be disentangled, freed! How long it takes to make this American world see that it is, in itself, the final authority and reliance!

* * *

I submit, therefore, that the fruition of democracy, . . . resides altogether in the future. As, under any profound and comprehensive view of the gorgeous-composite feudal world, we see in it, through the long ages and cycles of ages, the results of a deep, integral, human and divine principle, or fountain, from which issued laws, ecclesia, manners, institutes, costumes, personalities, poems, (hitherto unequall'd,) faithfully partaking of their source, and indeed only arising either to betoken it, or to furnish parts of that varied-flowing display, whose centre was one and absolute—so, long ages hence, shall the due historian or critic make at least an equal retrospect, an equal history for the democratic principle. It too must be adorn'd, credited with its results—then, when it, with imperial power, through amplest time, has dominated mankind—has been the source and test of all the moral, esthetic, social, political, and religious expressions and institutes of the civilized world—has begotten them in spirit and in form, and has carried them to its own unprecedented heights—has had, (it is possible,) monastics and ascetics, more numerous, more devout than the monks and priests of all previous creeds—has sway'd the ages with a breadth and rectitude tallying Nature's own—has fashion'd, systematized, and triumphantly finish'd and carried out, in its own interest, and with unparallel'd success, a new earth and a new man.

* * *

We have frequently printed the word Democracy. Yet I cannot too often repeat that it is a word the real gist of which still sleeps, quite unawaken'd, notwithstanding the resonance and the many angry tempests out of which its syllables have come, from pen or tongue. It is a great word, whose history, I suppose, remains unwritten, because that history has yet to be enacted. It is, in some sort, younger brother of another great and often-used word, Nature, whose history also waits unwritten. As I perceive, the tendencies of our day, in the States, (and I entirely respect them,) are toward those vast and sweeping movements, influences, moral and physical, of humanity, now and always current over the planet, on the scale of the impulses of the elements. Then it is also good to reduce the whole matter to the consideration of a single self, a man, a woman, on permanent grounds. Even for the treatment of the universal, in politics, metaphysics, or anything, sooner or later we come down to one single, solitary soul.

There is, in sanest hours, a consciousness, a thought that rises, independent, lifted out from all else, calm, like the stars, shining eternal. This is the thought of identity—yours for you, whoever you are, as mine for me. Miracle of miracles, beyond statement, most spiritual and vaguest of earth's dreams, yet hardest basic fact, and only entrance to all facts. In such devout hours, in the midst of the significant wonders of heaven and earth, (significant only because of the Me in the centre,) creeds, conventions, fall away and become of no account before this simple idea. Under the luminousness of real vision, it alone takes possession, takes value. Like the shadowy dwarf in the fable, once liberated and look'd upon, it expands over the whole earth, and spreads to the roof of heaven. The quality of BEING, in the object's self, according to its own central idea and purpose, and of growing therefrom and thereto—not criticism by other standards, and adjustments thereto—is the lesson of Nature. True, the full man wisely gathers, culls, absorbs; but if, engaged disproportionately in that, he slights or overlays the precious idiocrasy and special nativity and intention that he is, the man's self, the main thing, is a failure, however wide his general cultivation. Thus, in our times, refinement and delicatesse are not only attended to sufficiently, but threaten to eat us up, like a cancer. Already, the democratic genius watches, ill-pleased, these tendencies. Provision for a little healthy rudeness, savage virtue, justification of what one has in one's self, whatever it is, is demanded. Negative qualities, even deficiencies, would be a relief. Singleness and normal simplicity and separation, amid this more and more complex, more and more artificialized state of society—how pensively we yearn for them! how we would welcome their return!

* * *

America has yet morally and artistically originated nothing. She seems singularly unaware that the models of persons, books, manners, &c., appropriate for former conditions and for European lands, are but exiles and exotics here. No current of her life, as shown on the surfaces of what is authoritatively called her society, accepts or runs into social or esthetic democracy; but all the currents set squarely against it. Never, in the Old World, was thoroughly upholster'd exterior appearance and show, mental and other, built entirely on the idea of caste, and on the sufficiency of mere outside acquisition—never were glibness, verbal intellect, more the test, the emulation—more loftily elevated as head and sample—than they are on the surface of our republican States this day. The writers of a time hint the mottoes of its gods. The word of the modern, say these voices, is the word Culture. We find ourselves abruptly in close quarters with the enemy. This word Culture, or what it has come to represent, involves, by contrast, our whole theme, and has been, indeed, the spur, urging us to engagement. Certain questions arise. As now taught, accepted and carried out, are not the processes of culture rapidly creating a class of supercilious infidels, who believe in nothing? Shall a man lose himself in countless masses of adjustments, and be so shaped with reference to this, that, and the other, that the simply good and healthy and brave parts of him are reduced and clipp'd away, like the bordering of box in a garden? You can cultivate corn and roses and orchards—but who shall cultivate the mountain peaks, the ocean, and the tumbling gorgeousness of the clouds? Lastly—is the readily-given reply that culture only seeks to help, systematize, and put in attitude, the elements of fertility and power, a conclusive reply? I do not so much object to the name, or word, but I should certainly insist, for the purposes of these States, on a radical change of category, in the distribution of precedence. I should demand a programme of culture, drawn out, not for a single class alone, or for the parlors or lecture-rooms, but with an eye to practical life, the west, the working-men, the facts of farms and jack-planes and engineers, and of the broad range of the women also of the middle and working strata, and with reference to the perfect equality of women, and of a grand and powerful motherhood. I should demand of this programme or theory a scope generous enough to include the widest human area. It must have for its spinal meaning the formation of a typical personality of character, eligible to the uses of the high average of men—and not restricted by conditions ineligible to the masses. The best culture will always be that of the manly and courageous instincts, and loving perceptions, and of self-respect—aiming to form, over this continent, an idiocrasy of universalism, which, true child of America, will bring joy to its mother, returning to her in her own spirit, recruiting myriads of offspring, able, natural, perceptive, tolerant, devout believers in her, America, and with some definite instinct why and for what she has arisen, most vast, most formidable of historic births, and is, now and here, with wonderful step, journeying through Time.

The problem, as it seems to me, presented to the New World, is, under permanent law and order, and after preserving cohesion, (ensemble-Individuality,) at all hazards, to vitalize man's free play of special Personalism, recognizing in it something that calls ever more to be consider'd, fed, and adopted as the substratum for the best that belongs to us, (government indeed is for it,) including the new esthetics of our future.

* * *

What, however, do we more definitely mean by New World literature? Are we not doing well enough here already? Are not the United States this day busily using, working, more printer's type, more presses, than any other country? uttering and absorbing more publications than any other? Do not our publishers fatten quicker and deeper? (helping themselves, under shelter of a delusive and sneaking law, or rather absence of law, to most of their forage, poetical, pictorial, historical, romantic, even comic, without money and without price—and fiercely resisting the timidest proposal to pay for it.) Many will come under this delusion—but my purpose is to dispel it. I say that a nation may hold and circulate rivers and oceans of very readable print, journals, magazines, novels, library-books, "poetry," &c.—such as the States to-day possess and circulate—of unquestionable aid and value—hundreds of new volumes annually composed and brought out here, respectable enough, indeed unsurpass'd in smartness and erudition—with further hundreds, or rather millions, (as by free forage or theft aforemention'd,) also thrown into the market—and yet, all the while, the said nation, land, strictly speaking, may possess no literature at all.

Repeating our inquiry, what, then, do we mean by real literature? especially the democratic literature of the future? Hard questions to meet. The clues are inferential, and turn us to the past. At best, we can only offer suggestions, comparisons, circuits.

It must still be reiterated, as, for the purpose of these memoranda, the deep lesson of history and time, that all else in the contributions of a nation or age, through its politics, materials, heroic personalities, military eclat, &c., remains crude, and defers, in any close and thorough-going estimate, until vitalized by national, original archetypes in literature. They only put the nation in form, finally tell anything—prove, complete anything—perpetuate anything. Without doubt, some of the richest and most powerful and populous communities of the antique world, and some of the grandest personalities and events, have, to after and present times, left themselves entirely unbequeath'd. Doubtless, greater than any that have come down to us, were among those lands, heroisms, persons, that have not come down to us at all, even by name, date, or location. Others have arrived safely, as from voyages over wide, century-stretching seas. The little ships, the miracles that have buoy'd them, and by incredible chances safely convey'd them, (or the best of them, their meaning and essence,) over long wastes, darkness, lethargy, ignorance, &c., have been a few inscriptions—a few immortal compositions, small in size, yet compassing what measureless values of reminiscence, contemporary portraitures, manners, idioms and beliefs, with deepest inference, hint and thought, to tie and touch forever the old, new body, and the old, new soul! These! and still these! bearing the freight so dear—dearer than pride—dearer than love. All the best experience of humanity, folded, saved, freighted to us here. Some of these tiny ships we call Old and New Testament, Homer, Eschylus, Plato, Juvenal, &c. Precious minims! I think, if we were forced to choose, rather than have you, and the likes of you, and what belongs to, and has grown of you, blotted out and gone, we could better afford, appalling as that would be, to lose all actual ships, this day fasten'd by wharf, or floating on wave, and see them, with all their cargoes, scuttled and sent to the bottom.

Gather'd by geniuses of city, race or age, and put by them in highest of art's forms, namely, the literary form, the peculiar combinations and the outshows of that city, age, or race, its particular modes of the universal attributes and passions, its faiths, heroes, lovers and gods, wars, traditions, struggles, crimes, emotions, joys, (or the subtle spirit of these,) having been pass'd on to us to illumine our own selfhood, and its experiences—what they supply, indispensable and highest, if taken away, nothing else in all the world's boundless storehouses could make up to us, or ever again return.

For us, along the great highways of time, those monuments stand—those forms of majesty and beauty. For us those beacons burn through all the nights. Unknown Egyptians, graving hieroglyphs; Hindus, with hymn and apothegm and endless epic; Hebrew prophet, with spirituality, as in flashes of lightning, conscience like red-hot iron, plaintive songs and screams of vengeance for tyrannies and enslavement; Christ, with bent head, brooding love and peace, like a dove; Greek, creating eternal shapes of physical and esthetic proportion; Roman, lord of satire, the sword, and the codex;—of the figures, some far off and veil'd, others nearer and visible; Dante, stalking with lean form, nothing but fibre, not a grain of superfluous flesh; Angelo, and the great painters, architects, musicians; rich Shakspere, luxuriant as the sun, artist and singer of feudalism in its sunset, with all the gorgeous colors, owner thereof, and using them at will; and so to such as German Kant and Hegel, where they, though near us, leaping over the ages, sit again, impassive, imperturbable, like the Egyptian gods. Of these, and the like of these, is it too much, indeed, to return to our favorite figure, and view them as orbs and systems of orbs, moving in free paths in the spaces of that other heaven, the kosmic intellect, the soul?

Ye powerful and resplendent ones! ye were, in your atmospheres, grown not for America, but rather for her foes, the feudal and the old—while our genius is democratic and modern. Yet could ye, indeed, but breathe your breath of life into our New World's nostrils—not to enslave us, as now, but, for our needs, to breed a spirit like your own—perhaps, (dare we to say it?) to dominate, even destroy, what you yourselves have left! On your plane, and no less, but even higher and wider, must we mete and measure for to-day and here. I demand races of orbic bards, with unconditional uncompromising sway. Come forth, sweet democratic despots of the west!

By points like these we, in reflection, token what we mean by any land's or people's genuine literature. And thus compared and tested, judging amid the influence of loftiest products only, what do our current copious fields of print, covering in manifold forms, the United States, better, for an analogy, present, than, as in certain regions of the sea, those spreading, undulating masses of squid, through which the whale swimming, with head half out, feeds?

Not but that doubtless our current so-called literature, (like an endless supply of small coin,) performs a certain service, and may-be, too, the service needed for the time, (the preparation-service, as children learn to spell). Everybody reads, and truly nearly everybody writes, either books, or for the magazines or journals. The matter has magnitude, too, after a sort. But is it really advancing? or, has it advanced for a long while? There is something impressive about the huge editions of the dailies and weeklies, the mountain stacks of white paper piled in the press-vaults, and the proud, crashing, ten-cylinder presses, which I can stand and watch any time by the half hour. Then, (though the States in the field of imagination present not a single first-class work, not a single great literatus,) the main objects, to amuse, to titillate, to pass away time, to circulate the news, and rumors of news, to rhyme and read rhyme, are yet attain'd, and on a scale of infinity. To-day, in books, in the rivalry of writers, especially novelists, success, (so-call'd,) is for him or her who strikes the mean flat average, the sensational appetite for stimulus, incident, persiflage, &c., and depicts, to the common calibre, sensual, exterior life. To such, or the luckiest of them, as we see, the audiences are limitless and profitable; but they cease presently. While this day, or any day, to workmen portraying interior or spiritual life, the audiences were limited, and often laggard—but they last forever.

Compared with the past, our modern science soars, and our journals serve—but ideal and even ordinary romantic literature, does not, I think, substantially advance. Behold the prolific brood of the contemporary novel, magazine-tale, theatre-play, &c. The same endless thread of tangled and superlative love-story, inherited, apparently from the Amadises and Palmerins of the 13th, 14th, and 15th centuries over there in Europe. The costumes and associations brought down to date, the seasoning hotter and more varied, the dragons and ogres left out—but the thing, I should say, has not advanced—is just as sensational, just as strain'd—remains about the same, nor more, nor less.

What is the reason our time, our lands, that we see no fresh local courage, sanity, of our own—the Mississippi, stalwart Western men, real mental and physical facts, Southerners, &c., in the body of our literature? especially the poetic part of it. But always, instead, a parcel of dandies and ennuyees, dapper little gentlemen from abroad, who flood us with their thin sentiment of parlors, parasols, piano-songs, tinkling rhymes, the five-hundredth importation—or whimpering and crying about something, chasing one aborted conceit after another, and forever occupied in dyspeptic amours with dyspeptic women. While, current and novel, the grandest events and revolutions, and stormiest passions of history, are crossing to-day with unparallel'd rapidity and magnificence over the stages of our own and all the continents, offering new materials, opening new vistas, with largest needs, inviting the daring launching forth of conceptions in literature, inspired by them, soaring in highest regions, serving art in its highest, (which is only the other name for serving God, and serving humanity,) where is the man of letters, where is the book, with any nobler aim than to follow in the old track, repeat what has been said before—and, as its utmost triumph, sell well, and be erudite or elegant?

Mark the roads, the processes, through which these States have arrived, standing easy, henceforth ever-equal, ever-compact, in their range to-day. European adventures? the most antique? Asiatic or African? old history—miracles—romances? Rather, our own unquestion'd facts. They hasten, incredible, blazing bright as fire. From the deeds and days of Columbus down to the present, and including the present—and especially the late Secession war—when I con them, I feel, every leaf, like stopping to see if I have not made a mistake, and fall'n on the splendid figments of some dream. But it is no dream. We stand, live, move, in the huge flow of our age's materialism—in its spirituality. We have had founded for us the most positive of lands. The founders have pass'd to other spheres—but what are these terrible duties they have left us?

* * *

Present literature, while magnificently fulfilling certain popular demands, with plenteous knowledge and verbal smartness, is profoundly sophisticated, insane, and its very joy is morbid. It needs tally and express Nature, and the spirit of Nature, and to know and obey the standards. I say the question of Nature, largely consider'd, involves the questions of the esthetic, the emotional, and the religious—and involves happiness. A fitly born and bred race, growing up in right conditions of out-door as much as in-door harmony, activity and development, would probably, from and in those conditions, find it enough merely to live—and would, in their relations to the sky, air, water, trees, &c., and to the countless common shows, and in the fact of life itself, discover and achieve happiness—with Being suffused night and day by wholesome extasy, surpassing all the pleasures that wealth, amusement, and even gratified intellect, erudition, or the sense of art, can give.

In the prophetic literature of these States (the reader of my speculations will miss their principal stress unless he allows well for the point that a new Literature, perhaps a new Metaphysics, certainly a new Poetry, are to be, in my opinion, the only sure and worthy supports and expressions of the American Democracy,) Nature, true Nature, and the true idea of Nature, long absent, must, above all, become fully restored, enlarged, and must furnish the pervading atmosphere to poems, and the test of all high literary and esthetic compositions. I do not mean the smooth walks, trimm'd hedges, poseys and nightingales of the English poets, but the whole orb, with its geologic history, the kosmos, carrying fire and snow, that rolls through the illimitable areas, light as a feather, though weighing billions of tons. Furthermore, as by what we now partially call Nature is intended, at most, only what is entertainable by the physical conscience, the sense of matter, and of good animal health—on these it must be distinctly accumulated, incorporated, that man, comprehending these, has, in towering superaddition, the moral and spiritual consciences, indicating his destination beyond the ostensible, the mortal.

To the heights of such estimate of Nature indeed ascending, we proceed to make observations for our Vistas, breathing rarest air. What is I believe called Idealism seems to me to suggest, (guarding against extravagance, and ever modified even by its opposite,) the course of inquiry and desert of favor for our New World metaphysics, their foundation of and in literature, giving hue to all.*

* * *

I hail with joy the oceanic, variegated, intense practical energy, the demand for facts, even the business materialism of the current age, our States. But wo to the age or land in which these things, movements, stopping at themselves, do not tend to ideas. As fuel to flame, and flame to the heavens, so must wealth, science, materialism—even this democracy of which we make so much—unerringly feed the highest mind, the soul. Infinitude the flight: fathomless the mystery. Man, so diminutive, dilates beyond the sensible universe, competes with, outcopes space and time, meditating even one great idea. Thus, and thus only, does a human being, his spirit, ascend above, and justify, objective Nature, which, probably nothing in itself, is incredibly and divinely serviceable, indispensable, real, here. And as the purport of objective Nature is doubtless folded, hidden, somewhere here—as somewhere here is what this globe and its manifold forms, and the light of day, and night's darkness, and life itself, with all its experiences, are for—it is here the great literature, especially verse, must get its inspiration and throbbing blood. Then may we attain to a poetry worthy the immortal soul of man, and which, while absorbing materials, and, in their own sense, the shows of Nature, will, above all, have, both directly and indirectly, a freeing, fluidizing, expanding, religious character, exulting with science, fructifying the moral elements, and stimulating aspirations, and meditations on the unknown.

---

*The culmination and fruit of literary artistic expression, and its final fields of pleasure for the human soul, are in metaphysics, including the mysteries of the spiritual world, the soul itself, and the question of the immortal continuation of our identity. In all ages, the mind of man has brought up here—and always will. Here, at least, of whatever race or era, we stand on common ground. Applause, too, is unanimous, antique or modern. Those authors who work well in this field—though their reward, instead of a handsome percentage, or royalty, may be but simply the laurel-crown of the victors in the great Olympic games—will be dearest to humanity, and their works, however esthetically defective, will be treasur'd forever. The altitude of literature and poetry has always been religion—and always will be. The Indian Vedas, the Nackas of Zoroaster, the Talmud of the Jews, the Old Testament, the Gospel of Christ and his disciples, Plato's works, the Koran of Mohammed, the Edda of Snorro, and so on toward our own day, to Swedenborg, and to the invaluable contributions of Leibnitz, Kant and Hegel—these, with such poems only in which, (while singing well of persons and events, of the passions of man, and the shows of the material universe,) the religious tone, the consciousness of mystery, the recognition of the future, of the unknown, of Deity over and under all, and of the divine purpose, are never absent, but indirectly give tone to all—exhibit literature's real heights and elevations, towering up like the great mountains of the earth.

Standing on this ground—the last, the highest, only permanent ground—and sternly criticising, from it, all works, either of the literary, or any art, we have peremptorily to dismiss every pretensive production, however fine its esthetic or intellectual points, which violates or ignores, or even does not celebrate, the central divine idea of All, suffusing universe, of eternal trains of purpose, in the development, by however slow degrees, of the physical, moral, and spiritual kosmos. I say he has studied, meditated to no profit, whatever may be his mere erudition, who has not absorb'd this simple consciousness and faith. It is not entirely new—but it is for Democracy to elaborate it, and look to build upon and expand from it, with uncompromising reliance. Above the doors of teaching the inscription is to appear, Though little or nothing can be absolutely known, perceiv'd, except from a point of view which is evanescent, yet we know at least one permanency, that Time and Space, in the will of God, furnish successive chains, completions of material births and beginnings, solve all discrepancies, fears and doubts, and eventually fulfil happiness—and that the prophecy of those births, namely spiritual results, throws the true arch over all teaching, all science. The local considerations of sin, disease, deformity, ignorance, death, &c., and their measurement by the superficial mind, and ordinary legislation and theology, are to be met by science, boldly accepting, promulging this faith, and planting the seeds of superber laws—of the explication of the physical universe through the spiritual—and clearing the way for a religion, sweet and unimpugnable alike to little child or great savan.

The process, so far, is indirect and peculiar, and though it may be suggested, cannot be defined. Observing, rapport, and with intuition, the shows and forms presented by Nature, the sensuous luxuriance, the beautiful in living men and women, the actual play of passions, in history and life—and, above all, from those developments either in Nature or human personality in which power, (dearest of all to the sense of the artist,) transacts itself—out of these, and seizing what is in them, the poet, the esthetic worker in any field, by the divine magic of his genius, projects them, their analogies, by curious removes, indirections, in literature and art. (No useless attempt to repeat the material creation, by daguerreotyping the exact likeness by mortal mental means.) This is the image-making faculty, coping with material creation, and rivaling, almost triumphing over it. This alone, when all the other parts of a specimen of literature or art are ready and waiting, can breathe into it the breath of life, and endow it with identity.

"The true question to ask," says the librarian of Congress in a paper read before the Social Science Convention at New York, October, 1869, "The true question to ask respecting a book, is, has it help'd any human soul?" This is the hint, statement, not only of the great literatus, his book, but of every great artist. It may be that all works of art are to be first tried by their art qualities, their image-forming talent, and their dramatic, pictorial, plot-constructing, euphonious and other talents. Then, whenever claiming to be first-class works, they are to be strictly and sternly tried by their foundation in, and radiation, in the highest sense, and always indirectly, of the ethic principles, and eligibility to free, arouse, dilate.

As, within the purposes of the Kosmos, and vivifying all meteorology, and all the congeries of the mineral, vegetable and animal worlds—all the physical growth and development of man, and all the history of the race in politics, religions, wars, &c., there is a moral purpose, a visible or invisible intention, certainly underlying all—its results and proof needing to be patiently waited for—needing intuition, faith, idiosyncrasy, to its realization, which many, and especially the intellectual, do not have—so in the product, or congeries of the product, of the greatest literatus. This is the last, profoundest measure and test of a first-class literary or esthetic achievement, and when understood and put in force must fain, I say, lead to works, books, nobler than any hitherto known. Lo! Nature, (the only complete, actual poem,) existing calmly in the divine scheme, containing all, content, careless of the criticisms of a day, or these endless and wordy chatterers. And lo! to the consciousness of the soul, the permanent identity, the thought, the something, before which the magnitude even of democracy, art, literature, &c., dwindles, becomes partial, measurable—something that fully satisfies, (which those do not.) That something is the All, and the idea of All, with the accompanying idea of eternity, and of itself, the soul, buoyant, indestructible, sailing space forever, visiting every region, as a ship the sea. And again lo! the pulsations in all matter, all spirit, throbbing forever—the eternal beats, eternal systole and diastole of life in things—wherefrom I feel and know that death is not the ending, as was thought, but rather the real beginning—and that nothing ever is or can be lost, nor ever die, nor soul, nor matter.

* * *

Yet I have dream'd, merged in that hidden-tangled problem of our fate, whose long unraveling stretches mysteriously through time—dream'd out, portray'd, hinted already—a little or a larger band—a band of brave and true, unprecedented yet—arm'd and equipt at every point—the members separated, it may be, by different dates and States, or south, or north, or east, or west—Pacific, Atlantic, Southern, Canadian—a year, a century here, and other centuries there—but always one, compact in soul, conscience-conserving, God-inculcating, inspired achievers, not only in literature, the greatest art, but achievers in all art—a new, undying order, dynasty, from age to age transmitted—a band, a class, at least as fit to cope with current years, our dangers, needs, as those who, for their times, so long, so well, in armor or in cowl, upheld and made illustrious, that far-back feudal, priestly world. To offset chivalry, indeed, those vanish'd countless knights, old altars, abbeys, priests, ages and strings of ages, a knightlier and more sacred cause to-day demands, and shall supply, in a New World, to larger, grander work, more than the counterpart and tally of them.

Arrived now, definitely, at an apex for these Vistas, I confess that the promulgation and belief in such a class or institution—a new and greater literatus order—its possibility, (nay certainty,) underlies these entire speculations—and that the rest, the other parts, as superstructures, are all founded upon it. It really seems to me the condition, not only of our future national and democratic development, but of our perpetuation. In the highly artificial and materialistic bases of modern civilization, with the corresponding arrangements and methods of living, the force-infusion of intellect alone, the depraving influences of riches just as much as poverty, the absence of all high ideals in character—with the long series of tendencies, shapings, which few are strong enough to resist, and which now seem, with steam-engine speed, to be everywhere turning out the generations of humanity like uniform iron castings—all of which, as compared with the feudal ages, we can yet do nothing better than accept, make the best of, and even welcome, upon the whole, for their oceanic practical grandeur, and their restless wholesale kneading of the masses—I say of all this tremendous and dominant play of solely materialistic bearings upon current life in the United States, with the results as already seen, accumulating, and reaching far into the future, that they must either be confronted and met by at least an equally subtle and tremendous force-infusion for purposes of spiritualization, for the pure conscience, for genuine esthetics, and for absolute and primal manliness and womanliness—or else our modern civilization, with all its improvements, is in vain, and we are on the road to a destiny, a status, equivalent, in its real world, to that of the fabled damned.

Prospecting thus the coming unsped days, and that new order in them—marking the endless train of exercise, development, unwind, in nation as in man, which life is for—we see, fore-indicated, amid these prospects and hopes, new law-forces of spoken and written language—not merely the pedagogue-forms, correct, regular, familiar with precedents, made for matters of outside propriety, fine words, thoughts definitely told out—but a language fann'd by the breath of Nature, which leaps overhead, cares mostly for impetus and effects, and for what it plants and invigorates to grow—tallies life and character, and seldomer tells a thing than suggests or necessitates it. In fact, a new theory of literary composition for imaginative works of the very first class, and especially for highest poems, is the sole course open to these States. Books are to be call'd for, and supplied, on the assumption that the process of reading is not a half sleep, but, in highest sense, an exercise, a gymnast's struggle; that the reader is to do something for himself, must be on the alert, must himself or herself construct indeed the poem, argument, history, metaphysical essay—the text furnishing the hints, the clue, the start or frame-work. Not the book needs so much to be the complete thing, but the reader of the book does. That were to make a nation of supple and athletic minds, well-train'd, intuitive, used to depend on themselves, and not on a few coteries of writers.

Investigating here, we see, not that it is a little thing we have, in having the bequeath'd libraries, countless shelves of volumes, records, &c.; yet how serious the danger, depending entirely on them, of the bloodless vein, the nerveless arm, the false application, at second or third hand. We see that the real interest of this people of ours in the theology, history, poetry, politics, and personal models of the past, (the British islands, for instance, and indeed all the past,) is not necessarily to mould ourselves or our literature upon them, but to attain fuller, more definite comparisons, warnings, and the insight to ourselves, our own present, and our own far grander, different, future history, religion, social customs, &c. We see that almost everything that has been written, sung, or stated, of old, with reference to humanity under the feudal and oriental institutes, religions, and for other lands, needs to be re-written, re-sung, re-stated, in terms consistent with the institution of these States, and to come in range and obedient uniformity with them.

We see, as in the universes of the material kosmos, after meteorological, vegetable, and animal cycles, man at last arises, born through them, to prove them, concentrate them, to turn upon them with wonder and love—to command them, adorn them, and carry them upward into superior realms—so, out of the series of the preceding social and political universes, now arise these States. We see that while many were supposing things established and completed, really the grandest things always remain; and discover that the work of the New World is not ended, but only fairly begun.

We see our land, America, her literature, esthetics, &c., as, substantially, the getting in form, or effusement and statement, of deepest basic elements and loftiest final meanings, of history and man—and the portrayal, (under the eternal laws and conditions of beauty,) of our own physiognomy, the subjective tie and expression of the objective, as from our own combination, continuation, and points of view—and the deposit and record of the national mentality, character, appeals, heroism, wars, and even liberties—where these, and all, culminate in native literary and artistic formulation, to be perpetuated; and not having which native, first-class formulation, she will flounder about, and her other, however imposing, eminent greatness, prove merely a passing gleam; but truly having which, she will understand herself, live nobly, nobly contribute, emanate, and, swinging, poised safely on herself, illumin'd and illuming, become a full-form'd world, and divine Mother not only of material but spiritual worlds, in ceaseless succession through time—the main thing being the average, the bodily, the concrete, the democratic, the popular, on which all the superstructures of the future are to permanently rest.

Friedrich Nietzsche

1844–1900

The role of Nietzsche in the history of criticism and theory was much enlarged by the recent perception of him as one of the first real deconstructionists. Thus Jacques Derrida (below, page 1203) saw him as a thinker whose critique of Western metaphysics his own work extends. In *Truth and Falsity in an Ultramoral Sense,* Nietzsche questions the relation of language to truth. What comes under his gaze is the tendency of language always toward abstraction and away from the individual and real, and finally into the threat of rational fixity. The ghost of Kant (above, page 416) is often present here: Things in themselves cannot be known as such. Space and time are the spectacles we cannot remove. But in Nietzsche the theme is not perception as such but the intervention of language, which produces abstract illusions (Platonic ideas, generalizations) that hide the truth of things. From this questioning of language come Nietzsche's questioning of reason and his distinction between what he called the Dionysiac and the Apollonian, set forth in *The Birth of Tragedy from the Spirit of Music.* Appearing one year before *Truth and Falsity,* it was inspired partly by Richard Wagner, although Nietzsche later denounced him. The two terms distinguish the primitive from the rational and, in Nietzsche's view, the potentially unhealthy. As Greek tragedy developed, one impulse came to balance the other, Dionysiac ecstasy being ordered by Apollonian form and repose. Music, an attempt to give form to the world of spirit, strives toward symbolic expression of that Dionysiac wisdom characteristic of tragedy, but in modern life the tragic view has been suppressed in scientific optimism. It may be that it will not reappear until "science [has] at last been pushed to its limits." Every culture that has lost the Dionysiac mythmaking spirit "has lost, by the same token, its natural, healthy creativity." Nietzsche sees Dionysiac art and mythmaking as performing the disruption of the fixity toward which language in its Apollonian phase tends.

Nietzsche's view of art can be profitably contrasted to Zola's scientistic plan for the novel (below, page 699), and an interesting comparison can be made to Cassirer's somewhat more optimistic theory of symbolic forms (below, page 1018).

Nietzsche's complete works in translation are available in the eighteen-volume edition of 1909–1914 edited by Oscar Levy. An edition of Nietzsche in English is partly published. The Birth of Tragedy from the Spirit of Music

I

Much will have been gained for aesthetics once we have succeeded in apprehending directly—rather than merely *ascertaining*—that art owes its continuous evolution to the Apollonian-Dionysiac duality, even as the propagation of the species depends on the duality of the sexes, their constant conflicts and periodic acts of reconciliation. I have borrowed my adjectives from the Greeks, who developed their mystical doctrines of art through plausible *embodiments,* not through purely conceptual means. It is by those two art-sponsoring deities, Apollo and Dionysos,[1] that we are made to recognize the tremendous split, as regards both origins and objectives, between the plastic, Apollonian arts and the nonvisual art of music inspired by Dionysos. The two creative tendencies developed alongside one another, usually in fierce opposition, each by its taunts forcing the other to more energetic production, both perpetuating in a discordant concord that agon[2] which the term *art* but feebly denominates: until at last, by the thaumaturgy[3] of a Hellenic act of will, the pair accepted the yoke of marriage and, in this condition, begot Attic[4] tragedy, which exhibits the salient features of both parents.

To reach a closer understanding of both these tendencies, let us begin by viewing them as the separate art realms of *dream* and *intoxication,* two physiological phenomena standing toward one another in much the same relationship as the Apollonian and Dionysiac. It was in a dream, according to Lucretius,[5] that the marvelous gods and goddesses first presented themselves to the minds of men. That great sculptor, Phidias,[6] beheld in a dream the entrancing bodies of more-than-human beings, and likewise, if anyone had asked the Greek poets about the mystery of poetic creation, they too would have referred him to dreams and instructed him much as Hans Sachs instructs us in *Die Meistersinger:*

> My friend, it is the poet's work
> Dreams to interpret and to mark.
> Believe me that man's true conceit
> In a dream becomes complete:
> All poetry we ever read
> Is but true dreams interpreted.[7]

The fair illusion of the dream sphere, in the production of which every man proves himself an accomplished artist, is a precondition not only of all plastic art, but even, as we shall see presently, of a wide range of poetry. Here we enjoy an immediate apprehension of form, all shapes speak to us directly, nothing seems indifferent or redundant. Despite the high intensity with which these dream realities exist for us, we still have a residual sensation that they are illusions; at least such has been my experience—and the frequency, not to say normality, of the experience is borne out in many passages of the poets. Men of philosophical disposition are known for their constant premonition that our everyday reality, too, is an illusion, hiding another, totally different kind of reality. It was Schopenhauer[8] who considered the ability to view at certain times all men and things as mere phantoms or dream images to be the true mark of philosophic talent. The person who is responsive to the stimuli of art behaves toward the reality of dream much the way the philosopher behaves toward the reality of existence: he observes exactly and enjoys his observations, for it is by these images that he interprets life, by these processes that he rehearses it. Nor is it by pleasant images only that such plausible connections are made: the whole divine comedy of life, including its somber aspects, its sudden balkings, impish accidents, anxious expectations, moves past him, not quite like a shadow play—for it is he himself, after all, who lives and suffers through these scenes—yet never without giving a fleeting sense of illusion; and I imagine that many persons have reassured themselves amidst the perils of dream by calling out, "It is a dream! I want it to go on." I have even heard of people spinning out the causality of one and the same dream over three or more successive nights. All these facts clearly bear witness that our innermost being, the common substractum of humanity, experiences dreams with deep delight and a sense of real necessity. This deep

[8] Arthur Schopenhauer (1788–1860), German philosopher.

and happy sense of the necessity of dream experiences was expressed by the Greeks in the image of Apollo. Apollo is at once the god of all plastic powers and the soothsaying god. He who is etymologically the *lucent* one, the god of light, reigns also over the fair illusion of our inner world of fantasy. The perfection of these conditions in contrast to our imperfectly understood waking reality, as well as our profound awareness of nature's healing powers during the interval of sleep and dream, furnishes a symbolic analogue to the soothsaying faculty and quite generally to the arts, which make life possible and worth living. But the image of Apollo must incorporate that thin line which the dream image may not cross, under penalty of becoming pathological, of imposing itself on us as crass reality: a discreet limitation, a freedom from all extravagant urges, the sapient tranquility of the plastic god. His eye must be sunlike, in keeping with his origin. Even at those moments when he is angry and ill-tempered there lies upon him the consecration of fair illusion. In an eccentric way one might say of Apollo what Schopenhauer says, in the first part of *The World as Will and Idea,* of man caught in the veil of Maya:[9] "Even as on an immense, raging sea, assailed by huge wave crests, a man sits in a little rowboat trusting his frail craft, so, amidst the furious torments of this world, the individual sits tranquilly, supported by the *principium individuationis*[10] and relying on it." One might say that the unshakable confidence in that principle has received its most magnificent expression in Apollo, and that Apollo himself may be regarded as the marvelous divine image of the *principium individuationis,* whose looks and gestures radiate the full delight, wisdom, and beauty of "illusion."

In the same context Schopenhauer has described for us the tremendous awe which seizes man when he suddenly begins to doubt the cognitive modes of experience, in other words, when in a given instance the law of causation seems to suspend itself. If we add to this awe the glorious transport which arises in man, even from the very depths of nature, at the shattering of the *principium individuationis,* then we are in a position to apprehend the essence of Dionysiac rapture, whose closest analogy is furnished by physical intoxication. Dionysiac stirrings arise either through the influence of those narcotic potions of which all primitive races speak in their hymns, or through the powerful approach of spring, which penetrates with joy the whole frame of nature. So stirred, the individual forgets himself completely. It is the same Dionysiac power which in medieval Germany drove ever-increasing crowds of people singing and dancing from place to place; we recognize in these St. John's and St. Vitus' dancers the bacchic choruses of the Greeks, who had their precursors in Asia Minor and as far back as Babylon and the orgiastic Sacaea.[11] There are people who, either from lack of experience or out of sheer stupidity, turn away from such phenomena, and, strong in the sense of their own sanity, label them either mockingly or pityingly "endemic diseases." These benighted souls have no idea how cadaverous and ghostly their "sanity" appears as the intense throng of Dionysiac revelers sweeps past them.

Not only does the bond between man and man come to be forged once more by the magic of the Dionysiac rite, but nature itself, long alienated or subjugated, rises again to celebrate the reconciliation with her prodigal son, man. The earth offers its gifts voluntarily, and the savage beasts of mountain and desert approach in peace. The chariot of Dionysos is bedecked with flowers and garlands; panthers and tigers stride beneath his yoke. If one were to convert Beethoven's *Päen to Joy*[12] into a painting, and refuse to curb the imagination when that multitude prostrates itself reverently in the dust, one might form some apprehension of Dionysiac ritual. Now the slave emerges as a freeman; all the rigid, hostile walls which either necessity or despotism has erected between men are shattered. Now that the gospel of universal harmony is sounded, each individual becomes not only reconciled to his fellow but actually at one with him—as though the veils of Maya had been torn apart and there remained only shreds floating before the vision of mystical oneness. Man now expresses himself through song and dance as the member of a higher community; he has forgotten how to walk, how to speak, and is on the brink of taking wing as he dances. Each of his gestures betokens enchantment; through him sounds a supernatural power, the same power which makes the animals speak and the earth render up milk and honey. He feels himself to be godlike and strides with the same elation and ecstasy as the gods he has seen in his dreams. No longer the *artist,* he has himself become a *work of art:* the productive power of the whole universe is now manifest in his transport, to the glorious satisfaction of the primordial One. The finest clay, the most precious marble—man—is here kneaded and hewn, and the chisel blows of the Dionysiac world artist are accompanied by the cry of the Eleusinian mystagogues:[13] "Do you fall on your knees, multitudes, do you divine your creator?"

II

So far we have examined the Apollonian and Dionysiac states as the product of formative forces arising directly from nature without the mediation of the human artist. At this stage artistic urges are satisfied directly, on the one hand through the imagery of dreams, whose perfection is quite independent of the intellectual rank, the artistic development of the individual; on the other hand, through an ecstatic reality which once again takes no account of the individual and may even destroy him, or else redeem him through a mystical experience of the collective. In relation to these immediate creative conditions of nature every artist must appear as "imitator," either as the Apollonian dream artist or the Dionysiac ecstatic artist, or, finally (as in Greek tragedy, for example) as dream and ecstatic artist in one. We might picture to ourselves how the last of these, in a state of Dionysiac intoxication and mystical self-abrogation, wandering apart from the reveling throng, sinks upon the ground, and how there is then revealed to him his own condition—complete oneness with the essence of the universe—in a dream similitude.

Having set down these general premises and distinctions, we now turn to the Greeks in order to realize to what degree the formative forces of nature were developed in them. Such an inquiry will enable us to assess properly the relation of the Greek artist to his prototypes or, to use Aristotle's expression, his "imitation of nature."[14] Of the dreams the Greeks dreamed it is not possible to speak with any certainty, despite the extant dream literature and the large number of dream anecdotes. But considering the incredible accuracy of their eyes, their keen and unabashed delight in colors, one can hardly be wrong in assuming that their dreams too showed a strict consequence of lines and contours, hues and groupings, a progression of scenes similar to their best bas-reliefs. The perfection of these dream scenes might almost tempt us to consider the dreaming Greek as a Homer and Homer as a dreaming Greek; which would be as though the modern man were to compare himself in his dreaming to Shakespeare.

Yet there is another point about which we do not have to conjecture at all; I mean the profound gap separating the Dionysiac Greeks from the Dionysiac barbarians. Throughout the range of ancient civilization (leaving the newer civilizations out of account for the moment) we find evidence of Dionysiac celebrations which stand to the Greek type in much the same relation as the bearded satyr, whose name and attributes are derived from the he-goat, stands to the god Dionysos. The central concern of such celebrations was, almost universally, a complete sexual promiscuity overriding every form of established tribal law; all the savage urges of the mind were unleashed on those occasions until they reached that paroxysm of lust and cruelty which has always struck me as the "witches' cauldron" par excellence. It would appear that the Greeks were for a while quite immune from these feverish excesses which must have reached them by every known land or sea route. What kept Greece safe was the proud, imposing image of Apollo, who in holding up the head of the Gorgon[15] to those brutal and grotesque Dionysiac forces subdued them. Doric art has immortalized Apollo's majestic rejection of all license. But resistance became difficult, even impossible as soon as similar urges began to break forth from the deep substratum of Hellenism itself. Soon the function of the Delphic god[16] developed into something quite different and much more limited: all he could hope to accomplish now was to wrest the destructive weapon, by a timely gesture of pacification, from his opponent's hand. That act of pacification represents the most important event in the history of Greek ritual; every department of life now shows symptoms of a revolutionary change. The two great antagonists have been reconciled. Each feels obliged henceforth to keep to his bounds, each will honor the other by the bestowal of periodic gifts, while the cleavage remains fundamentally the same. And yet, if we examine what happened to the Dionysiac powers under the pressure of that treaty we notice a great difference: in the place of the Babylonian Sacaea, with their throwback of men to the condition of apes and tigers, we now see entirely new rites celebrated: rites of universal redemption, of glorious transfiguration. Only now has it become possible to speak of nature's celebrating an *aesthetic* triumph; only now has the abrogation of the *principium individuationis* become an aesthetic event. That terrible witches' brew concocted of lust and cruelty has lost all power under the new conditions. Yet the peculiar blending of emotions in the heart of the Dionysiac reveler—his ambiguity if you will—seems still to hark back (as the medicinal drug harks back to the deadly poison) to the days when the infliction of pain was experienced as joy while a sense of supreme triumph elicited cries of anguish from the heart. For now in every exuberant joy there is heard an undertone of terror, or else a wistful lament over an irrecoverable loss. It is as though in these Greek festivals a sentimental trait of nature were coming to the fore, as though nature were bemoaning the fact of her fragmentation, her decomposition into separate individuals. The chants and gestures of these revelers, so ambiguous in their motivation, represented an absolute *novum*[17] in the world of the Homeric Greeks; their Dionysiac music, in especial, spread abroad terror and a deep shudder. It is true: music had long been familiar to the Greeks as an Apollonian art, as a regular beat like that of waves lapping the shore, a plastic rhythm expressly developed for the portrayal of Apollonian conditions. Apollo's music was a Doric architecture of sound—of barely hinted sounds such as are proper to the cithara. Those very elements which characterize Dionysiac music and, after it, music quite generally: the heart-shaking power of tone, the uniform stream of melody, the incomparable resources of harmony—all those elements had been carefully kept at a distance as being inconsonant with the Apollonian norm. In the Dionysiac dithyramb[18] man is incited to strain his symbolic faculties to the utmost; something quite unheard of is now clamoring to be heard: the desire to tear asunder the veil of Maya, to sink back into the original oneness of nature; the desire to express the very essence of nature symbolically. Thus an entirely new set of symbols springs into being. First, all the symbols pertaining to physical features: mouth, face, the spoken word, the dance movement which coordinates the limbs and bends them to its rhythm. Then suddenly all the rest of the symbolic forces—music and rhythm as such, dynamics, harmony—assert themselves with great energy. In order to comprehend this total emancipation of all the symbolic powers one must have reached the same measure of inner freedom those powers themselves were making manifest; which is to say that the votary of Dionysos could not be understood except by his own kind. It is not difficult to imagine the awed surprise with which the Apollonian Greek must have looked on him. And that surprise would be further increased as the latter realized, with a shudder, that all this was not so alien to him after all, that his Apollonian consciousness was but a thin veil hiding from him the whole Dionysiac realm.

[15] One of three sisters who when looked upon turned the beholder to stone.

[16] Apollo, whose oracle was at Delphi.

XVII

. . . The struggle of the spirit of music to become manifest in image and myth—a struggle that grew in intensity from the beginnings of lyric poetry to the flowering of Attic tragedy—came to a sudden halt and disappeared, as it were, from the Hellenic scene. Yet the Dionysiac world view born of this struggle managed to survive in the mysteries, and even in its strangest metamorphoses and debasements did not cease to attract thoughtful minds. Who knows whether that conception will not once again rise as art from its mystical depths?

What concerns us here is the question whether those powers to whose influence Greek tragedy succumbed will maintain their ascendancy permanently, thereby blocking for good the renascence of tragedy and the tragic world view. The fact that the dialectical drive toward knowledge and scientific optimism has succeeded in turning tragedy from its course suggests that there may be an eternal conflict between the theoretical and the tragic world view, in which case tragedy could be reborn only when science had at last been pushed to its limits and, faced with those limits, been forced to renounce its claim to universal validity. For the new hypothetical tragedy the music-practicing Socrates might be a fitting symbol.

If we remember the immediate consequences of the restless and inquisitive spirit of science, it can come as no surprise to us that it destroyed myth and, by the same token, displaced poetry from its native soil and rendered it homeless. If we are right in crediting music with the power to revive myth, then we must look for science in those places where it actively opposes the mythopoeic power of music. It did so in the later Attic dithyramb, whose music no longer expressed the innermost being, or will itself, but only reproduced the phenomenon in a mediate, conceptualized form. Truly musical minds turned away from that degenerate kind of music with the same distaste they felt for the anti-artistic tendencies of Socrates. Aristophanes' sure instinct was doubtless right when he lumped together Socrates, the Euripidean drama, and the music of the new dithyrambic poets, castigating them indifferently as symptoms of a degenerate culture.[19] In the new dithyramb, music is degraded to the imitative portrayal of phenomena, such as battles or storms at sea, and thereby robbed of all its mythopoeic power. For we are not in a condition to yield ourselves to the mythic force when music simply tries to beguile us with external analogies between some natural event and certain rhythmical and acoustical combinations, when our reason is called upon to satisfy itself in the recognition of such analogies. Truly Dionysiac music offers us a universal mirror of the world will: every particular incident refracted in that mirror is enlarged into the image of a permanent truth. Conversely, the tone pictures of the new dithyramb strip every such concrete incident at once of its mythic implications. Music here has become a paltry replica of the phenomenon and for that very reason infinitely poorer than the phenomenon itself. And the poverty of the replica further reduces the phenomenon to our consciousness. A battle, thus imitated, becomes a mere sequence of marches, trumpet calls and the like, and our imagination is stopped at the level of such superficialities. Tone painting, then, is in every respect at the opposite pole from the mythopoeic power of true music: it further reduces the phenomenon, while Dionysiac music makes every single phenomenon comprehensive and significant. The anti-Dionysiac spirit won a mighty victory when it estranged music from itself and made it a slave to appearances. Euripides, who, albeit in a higher sense, must be called an absolutely unmusical temperament, was for that very reason a passionate partisan of the new dithyramb and used its entire stock-in-trade with a freebooter's prodigality.

[17] "New thing."

[18] A wild choric hymn.

[19] Aristophanes (c. 448–after 388 B.C.) satirized Socrates in *The Clouds*. Euripides (c. 485–406 B.C.), Greek tragic dramatist.

We see a different aspect of this anti-Dionysiac, antimythic trend in the increased emphasis on character portrayal and psychological subtlety from Sophocles[20] onward. Character must no longer be broadened so as to become a permanent type, but on the contrary must be so finely individualized, by means of shading and nuances and the strict delineation of every trait, that the spectator ceases to be aware of myth at all and comes to focus on the amazing lifelikeness of the characters and the artist's power of imitation. Here, once again, we see the victory of the particular over the general and the pleasure taken in, as it were, anatomical drawing. We breathe the air of a world of theory, in which scientific knowledge is more revered than the artistic reflection of a universal norm. The cult of the characteristic trait develops apace: Sophocles still paints whole characters and lays myth under contribution in order to render them more fully; Euripides concentrates on large single character traits, projected into violent passions; the new Attic comedy gives us masks, each with a single expression: frivolous old men, hoodwinked panders, roguish slaves, in endless repetition. Where is now the mythopoeic spirit? All that remains to music is to excite jaded nerves or call up memory images, as in tone painting. For the former, the text hardly matters any longer. Already in Euripides things get out of control as soon as his characters or his chorus begin to sing, and heaven only knows what his impudent followers may have been guilty of.

Yet the modish anti-Dionysiac spirit shows itself most clearly in the dénouements of the new plays. In the older tragedy one could feel at the end the metaphysical solace, without which it is impossible to imagine our taking pleasure in tragedy. Most purely, perhaps, in *Oedipus at Colonus*[21] we hear those harmonious sounds of reconciliation from another world. But, once the genius of music has departed from tragedy, tragedy is dead, for what, henceforth, is to furnish that metaphysical solace? The new dramatists tried to resolve the tragic dissonance in terrestrial terms: after having been sufficiently buffeted by fate, the hero was compensated in the end by a distinguished marriage and divine honors. He thus resembled a gladiator, who might perchance be set free after he had taken his beating and was covered with wounds. The place of metaphysical solace was now taken by the *deus ex machina*.[22] I do not mean to assert that the tragic spirit was everywhere quite eradicated by the anti-Dionysiac onset; but we do know that it was forced to flee from the realm of art and take refuge in the limbo of aberrant secret rites. Meanwhile, there raged over the entire surface of the Hellenic world the pestilence of that counterfeit "Greek serenity" of which I spoke earlier: a senescent and unproductive affirmation of this life, in utter contrast to the marvelous naiveté of the older Greeks—flower of an Apollonian culture blossoming over a somber abyss, in token of the victory of the Greek will over suffering, and of the wisdom of suffering. The other variety of Greek cheerfulness—the Alexandrian—shows at its best in the man of theory; it exhibits the same characteristics that I have just derived from the general anti-Dionysiac ascendant. It opposes Dionysiac wisdom and art; tries to dissolve the power of myth; puts in place of a metaphysical comfort a terrestrial consonance and a special *deus ex machina*—the god of engines and crucibles: forces of nature put in the service of a higher form of egotism. It believes that the world can be corrected through knowledge and that life should be guided by science; that it is actually in a position to confine man within the narrow circle of soluble tasks, where he can say cheerfully to life: "I want you. You are worth knowing."

XXIII

If one wants to try whether he is such a spectator or whether he belongs, rather, to the community of Socratic men, he may ask himself honestly with what emotion he responds to the miracle on the stage; whether he feels that his historical sense, trained to look everywhere for strict psychological causation, has been outraged, whether he admits the miracle as a phenomenon that seems natural to child minds but rather remote from himself, or whether he has some different sort of response. Depending on what answer he makes, he will be able to tell whether he has any understanding at all of myth, which, being a concentrated image of the world, an emblem of appearance, cannot dispense with the miracle. The chances are that almost every one of us, upon close examination, will have to admit that he is able to approach the once-living reality of myth only by means of intellectual constructs. Yet every culture that has lost myth has lost, by the same token, its natural, healthy creativity. Only a horizon ringed about with myths can unify a culture. The forces of imagination and of Apollonian dream are saved only by myth from indiscriminate rambling. The images of myth must be the demonic guardians, ubiquitous but unnoticed, presiding over the growth of the child's mind and interpreting to the mature man his life and struggles. Nor does the commonwealth know any more potent unwritten law than that mythic foundation which guarantees its union with religion and its basis in mythic conceptions. Over against this, let us consider abstract man stripped of myth, abstract education, abstract mores, abstract laws, abstract government; the random vagaries of the artistic imagination unchanneled by any native myth; a culture without any fixed and consecrated place of origin, condemned to exhaust all possibilities and feed miserably and parasitically on every culture under the sun. Here we have our present age, the result of a Socratism bent on the extermination of myth. Man today, stripped of myth, stands famished among all his pasts and must dig frantically for roots, be it among the most remote antiquities. What does our great historical hunger signify, our clutching about us of countless other cultures, our consuming desire for knowledge, if not the loss of myth, of a mythic home, the mythic womb? Let us ask ourselves whether our feverish and frightening agitation is anything but the greedy grasping for food of a hungry man. And who would care to offer further nourishment to a culture which, no matter how much it consumes, remains insatiable and which converts the strongest and most wholesome food into "history" and "criticism"?

[20] Sophocles (c. 496–406 B.C.), Greek tragic dramatist.

[21] By Sophocles.

[22] "God from the machine," coincidence employed to carry out the plot, deplored by Aristotle (above, page 59).

Truth and Falsity in an Ultramoral Sense

In some remote corner of the universe, effused into innumerable solar systems, there was once a star upon which clever animals invented cognition. It was the haughtiest, most mendacious moment in the history of this world, but yet only a moment. After Nature had taken breath awhile, the star congealed and the clever animals had to die.—Someone might write a fable after this style, and yet he would not have illustrated sufficiently, how wretched, shadowlike, transitory, purposeless, and fanciful the human intellect appears in Nature. There were eternities during which this intellect did not exist, and when it has once more passed away, there will be nothing to show that it has existed. For this intellect is not concerned with any further mission transcending the sphere of human life. No, it is purely human and none but its owner and procreator regards it so pathetically as to suppose that the world revolves around it. If, however, we and the gnat could understand each other, we should learn that even the gnat swims through the air with the same pathos, and feels within itself the flying center of the world. Nothing in Nature is so bad or so insignificant that it will not, at the smallest puff of that force cognition, immediately swell up like a balloon, and just as a mere porter wants to have his admirer, so the very proudest man, the philosopher, imagines he sees from all sides the eyes of the universe telescopically directed upon his actions and thoughts.

It is remarkable that this is accomplished by the intellect, which after all has been given to the most unfortunate, the most delicate, the most transient beings only as an expedient, in order to detain them for a moment in existence, from which without that extra gift they would have every cause to flee as swiftly as Lessing's son.[1] That haughtiness connected with cognition and sensation, spreading blinding fogs before the eyes and over the senses of men, deceives itself therefore as to the value of existence owing to the fact that it bears within itself the most flattering evaluation of cognition. Its most general effect is deception, but even its most particular effects have something of deception in their nature.

The intellect, as a means for the preservation of the individual, develops its chief power in dissimulation; for it is by dissimulation that the feebler and less robust individuals preserve themselves, since it has been denied them to fight the battle of existence with horns or the sharp teeth of beasts of prey. In man this art of dissimulation reaches its acme of perfection: in him deception, flattery, falsehood and fraud,

Ueber Wahrheit und Luge im aussermoralischen Sinne (1873) is from *Early Greek Philosophy and Other Essays*, which constitutes Volume II of the *Complete Works of Friedrich Nietzsche* (in eighteen volumes, 1909–1924), edited by Oscar Levy. The translation is by Maximilian A. Mügge.

[1] [Mügge] The German poet, Lessing [above, page 378], had been married for just a little over one year to Eva König. A son was born and died the same day, and the mother's life was despaired of. In a letter to his friend Esschenberg the poet wrote: ". . . and I lost him so unwillingly, this son! For he had so much understanding! Do not suppose that the few hours of fatherhood have made me an ape of a father! I know what I say. Was it not understanding, that they had to drag him into the world with a pair of forceps? that he so soon suspected the evil of this world? Was it not understanding, that he seized the first opportunity to get away from it?. . ." Eva König died a week later.

slander, display, pretentiousness, disguise, cloaking convention, and acting to others and to himself, in short, the continual fluttering to and fro around the *one* flame—Vanity: all these things are so much the rule, and the law, that few things are more incomprehensible than the way in which an honest and pure impulse to truth could have arisen among men. They are deeply immersed in illusions and dream fancies; their eyes glance only over the surface of things and see "forms"; their sensation nowhere leads to truth, but contents itself with receiving stimuli and, so to say, with playing hide-and-seek on the back of things. In addition to that, at night man allows his dreams to lie to him a whole lifetime long, without his moral sense ever trying to prevent them; whereas men are said to exist who by the exercise of a strong will have overcome the habit of snoring. What indeed *does* man know about himself? Oh! that he could but once see himself complete, placed as it were in an illuminated glass case! Does not nature keep secret from him most things, even about his body, e.g., the convolutions of the intestines, the quick flow of the blood currents, the intricate vibrations of the fibers, so as to banish and lock him up in proud, delusive knowledge? Nature threw away the key; and woe to the fateful curiosity which might be able for a moment to look out and down through a crevice in the chamber of consciousness and discover that man, indifferent to his own ignorance, is resting on the pitiless, the greedy, the insatiable, the murderous, and, as it were, hanging in dreams on the back of a tiger. Whence, in the wide world, with this state of affairs, arises the impulse to truth?

As far as the individual tries to preserve himself against other individuals, in the natural state of things he uses the intellect in most cases only for dissimulation; since, however, man both from necessity and boredom wants to exist socially and gregariously, he must needs make peace and at least endeavor to cause the greatest *bellum omnium contra omnes*[2] to disappear from his world. This first conclusion of peace brings with it a something which looks like the first step toward the attainment of that enigmatical bent for truth. For that which henceforth is to be "truth" is now fixed; that is to say, a uniformly valid and binding designation of things is invented and the legislature of language also gives the first laws of truth: since here, for the first time, originates the contrast between truth and falsity. The liar uses the valid designations, the words, in order to make the unreal appear as real, e.g., he says "I am rich," whereas the right designation for his state would be "poor." He abuses the fixed conventions by convenient substitution or even inversion of terms. If he does this in a selfish and moreover harmful fashion, society will no longer trust him but will even exclude him. In this way men avoid not so much being defrauded, but being injured by fraud. At bottom, at this juncture, too, they hate not deception, but the evil, hostile consequences of certain species of deception. And it is in a similarly limited sense only that man desires truth: he covets the agreeable, life-preserving consequences of truth; he is indifferent toward pure, ineffective knowledge; he is even inimical toward truths which possibly might prove harmful or destroying. And, moreover, what after all are those conventions of language? Are they possibly products of knowledge, of the love of truth; do the designations and the things coincide? Is language the adequate expression of all realities?

Only by means of forgetfulness can man ever arrive at imagining that he possesses "truth" in that degree just indicated. If he does not mean to content himself with truth in the shape of tautology, that is, with empty husks, he will always obtain illusions instead of truth. What is a word? The expression of a nerve stimulus in sounds. But to infer a cause outside us from the nerve stimulus is already the result of a wrong and unjustifiable application of the proposition of causality. How should we dare, if truth with the genesis of language, if the point of view of certainty with the designations had alone been decisive; how indeed should we dare to say: the stone is hard; as if "hard" was known to us otherwise, and not merely as an entirely subjective stimulus! We divide things according to genders; we designate the tree as masculine,[3] the plant as feminine:[4] what arbitrary metaphors! How far-flown beyond the canon of certainty! We speak of a "serpent";[5] the designation fits nothing but the sinuosity, and could therefore also appertain to the worm. What arbitrary demarcations! What one-sided preferences given sometimes to this, sometimes to that quality of a thing! The different languages placed side by side show that with words truth or adequate expression matters little: for otherwise there would not be so many languages. The "Thing-in-itself" (it is just this which would be the pure ineffective truth) is also quite incomprehensible to the creator of language and not worth making any great endeavor to obtain. He designates only the relations of things to men and for their expression he calls to his help the most daring metaphors. A nerve stimulus, first transformed into a percept! First metaphor! The percept again copied into a sound! Second metaphor! And each time he leaps completely out of one sphere right into the midst of an entirely different one. One can imagine a man who is quite deaf and has never had a sensation of tone and of music; just as this man will possibly marvel at Chladni's[6] sound figures in the sand, will discover their cause in the vibrations of the string, and will then proclaim that now he knows what man calls "tone"; even so does it happen to us all with language. When we talk about trees, colors, snow, and flowers, we believe we know something about the things themselves, and yet we only possess metaphors of the things, and these metaphors do not in the least correspond to the original essentials. Just as the sound shows itself as a sad figure, in the same way the enigmatical *x* of the Thing-in-itself is seen first as nerve stimulus, then as percept, and finally as sound.[7] At any rate the genesis of language did not therefore proceed on logical lines, and the whole material in which and with which the man of truth, the investigator, the philosopher works and builds, originates, if not from Nephelococcygia, cloudland, at any rate not from the essence of things.

---

[2] "War of all against all."

[3] [Mügge] In German *the tree—der Baum*—is masculine.

[4] [Mügge] In German *the plant—die Phlanze*—is feminine.

[5] [Mügge] Cf. the German *die Schlange* and *schlingen*, the English *serpent* from the Latin *serpere*.

Let us especially think about the formation of ideas. Every word becomes at once an idea not by having, as might presume, to serve as a reminder for the original experience happening but once and absolutely individualized, to which experience such word owes its origin, no, but by having simultaneously to fit innumerable, more or less similar (which really means never equal, therefore altogether unequal) cases. Every idea originates through equating the unequal. As certainly as no one leaf is exactly similar to any other, so certain is it that the idea "leaf" has been formed through an arbitrary omission of these individual differences, through a forgetting of the differentiating qualities, and this idea now awakens the notion that in nature there is, besides the leaves, a something called *the* "leaf," perhaps a primal form according to which all leaves were woven, drawn, accurately measured, colored, crinkled, painted, but by unskilled hands, so that no copy had turned out correct and trustworthy as a true copy of the primal form. We call a man "honest"; we ask, why has he acted so honestly today? Our customary answer runs, "On account of his honesty." *The* Honesty! That means again: the "leaf" is the cause of the leaves. We really and truly do not know anything at all about an essential quality which might be called *the* honesty, but we do know about numerous individualized; and therefore unequal actions, which we equate by omission of the unequal, and now designate as honest actions; finally out of them we formulate a *qualitas occulta* with the name "Honesty."[8]

The disregarding of the individual and real furnishes us with the idea, as it likewise also gives us the form; whereas nature knows of no forms and ideas, and therefore knows no species but only an *x*, to us inaccessible and indefinable. For our antithesis of individual and species is anthropomorphic too and does not come from the essence of things, although on the other hand we do not dare to say that it does not correspond to it; for that would be a dogmatic assertion and as such just as undemonstrable as its contrary.

What therefore is truth? A mobile army of metaphors, metonymies, anthropomorphisms: in short a sum of human relations which became poetically and rhetorically intensified, metamorphosed, adorned, and after long usage seems to a nation fixed, canonic, and binding; truths are illusions of which one has forgotten that they *are* illusions; worn-out metaphors which have become powerless to affect the senses; coins which have their obverse effaced and now are no longer of account as coins but merely as metal. Still we do not yet know whence the impulse to truth comes, for up to now we have heard only about the obligation which society imposes in order to exist: to be truthful, that is, to use the usual metaphors, therefore expressed morally: we have heard only about the obligation to lie according to a fixed convention, to lie gregariously in a style binding for all. Now man, of course, forgets that matters are going thus with him; he therefore lies in that fashion pointed out unconsciously and according to habits of centuries' standing—and by *this very unconsciousness,* by this very forgetting, he arrives at a sense for truth. Through this feeling of being obliged to designate one thing as "red," another as "cold," a third one as "dumb," awakes a moral emotion relating to truth. Out of the antithesis "liar" whom nobody trusts, whom all exclude, man demonstrates to himself the venerableness, reliability, usefulness of truth. Now as a *"rational"* being he submits his actions to the sway of abstractions; he no longer suffers himself to be carried away by sudden impressions, by sensations, he first generalizes all these impressions into paler, cooler ideas, in order to attach to them the ship of his life and actions. Everything which makes man stand out in bold relief against the animal depends on this faculty of volatilizing the concrete metaphors into a schema, and therefore resolving a perception into an idea. For within the range of those schemata a something becomes possible that never could succeed under the first perceptual impressions: to build up a pyramidal order with castes and grades, to create a new world of laws, privileges, suborders, delimitations, which now stands opposite the other perceptual world of first impressions and assumes the appearance of being the more fixed, general, known, human of the two and therefore the regulating and imperative one.

---

[6] Ernst Florenz Friedrich Chladni (1756–1827), German physicist. Chladni figures were designs formed in sand and put on plates that were then made to vibrate.

[7] Nietzsche here adopts Kant's notion of the unknowable thing in itself.

[8] "Occult quality."

Whereas every metaphor of perception is individual and without its equal and therefore knows how to escape all attempts to classify it, the great edifice of ideas shows the rigid regularity of a Roman columbarium and in logic breathes forth the sterness and coolness which we find in mathematics. He who has been breathed upon by this coolness will scarcely believe that the idea, too, bony and hexahedral and permutable as a die, remains, however, only as the *residuum of a metaphor*; and that the illusion of the artistic metamorphosis of a nerve stimulus into percepts is, if not the mother, then the grandmother of every idea. Now in this game of dice, "Truth" means to use every die as it is designated; to count its points carefully, to form exact classifications, and never to violate the order of castes and the sequences of rank. Just as the Romans and Etruscans for their benefit cut up the sky by means of strong mathematical lines and banned a god as it were into a *templum,* into a space limited in this fashion, so every nation has above its head such a sky of ideas divided up mathematically, and it understands the demand for truth to mean that every conceptual god is to be looked for only in *his* own sphere. One may here well admire man, who succeeded in piling up an infinitely complex dome of ideas on a movable foundation and as it were on running water, as a powerful genius of architecture. Of course in order to obtain hold on such a foundation it must be as an edifice piled up out of cobwebs, so fragile as to be carried away by the waves, so firm as not to be blown asunder by every wind. In this way man as an architectural genius rises high above the bee; she builds with wax, which she brings together out of nature; he with the much more delicate material of ideas, which he must first manufacture within himself. He is very much to be admired here—but not on account of his impulse for truth, his bent for pure cognition of things. If somebody hides a thing behind a bush, seeks it again and finds it in the self same place, then there is not much to boast of, respecting this seeking and finding: thus, however, matters stand with the seeking and finding of "truth" within the realm of reason. If I make the definition of the mammal and then declare after inspecting a camel, "Behold a mammal," then no doubt a truth is brought to light thereby, but it is of very limited value, I mean it is anthropomorphic through and through, and does not contain one single point which is "true-in-itself," real, and universally valid, apart from man. The seeker after such truths seeks at the bottom only the metamorphosis of the world in man; he strives for an understanding of the world as a humanlike thing and by his battling gains at best the feeling of an assimilation. Similarly, as the astrologer contemplated the stars in the service of men and in connection with their happiness and unhappiness, such a seeker contemplates the whole world as related to man, as the infinitely protracted echo of an original sound: man; as the multiplied copy of the one archetype: man. His procedure is to apply man as the measure of all things, whereby he starts from the error of believing that he has these things immediately before him as pure objects. He therefore forgets that the original metaphors of perception *are* metaphors, and takes them for the things themselves.

Only by forgetting that primitive world of metaphors, only by the congelation and coagulation of an original mass of similes and percepts pouring forth as a fiery liquid out of the primal faculty of human fancy, only by the invincible faith, that *this* sun, *this* window, *this* table is a truth in itself: in short only by the fact that man forgets himself as subject, and what is more as an *artistically creating* subject, only by all this does he live with some repose, safety, and consequence. If he were able to get out of the prison walls of this faith, even for an instant only, his "self-consciousness" would be destroyed at once. Already it costs him some trouble to admit to himself that the insect and the bird perceive a world different from his own, and that the question, which of the two world-perceptions is more accurate, is quite a senseless one, since to decide this question it would be necessary to apply the standard of *right perception,* i.e., to apply a standard which *does not exist.* On the whole it seems to me that the "right perception"—which would mean the adequate expression of an object in the subject—is a nonentity full of contradictions: for between two utterly different spheres, as between subject and object, there is no causality, no accuracy, no expression, but at the utmost an *aesthetical* relation, I mean a suggestive metamorphosis, a stammering translation into quite a distinct foreign language, for which purpose, however, there is needed at any rate an intermediate sphere, an intermediate force, freely composing and freely inventing. The word "phenomenon" contains many seductions, and on that account I avoid it as much as possible, for it is not true that the essence of things appears in the empiric world. A painter who had no hands and wanted to express the picture distinctly present to his mind by the agency of song would still reveal much more with this permutation of spheres than the empiric world reveals about the essence of things. The very relation of a nerve stimulus to the produced percept is in itself no necessary one; but if the same percept has been reproduced millions of times and has been the inheritance of many successive generations of man, and in the end appears each time to all mankind as the result of the same cause, then it attains finally for man the same importance as if it were *the* unique, necessary percept and as if that relation between the original nerve stimulus and the percept produced were a close relation of causality: just as a dream eternally repeated would be perceived and judged as though real. But the congelation and coagulation of a metaphor does not at all guarantee the necessity and exclusive justification of that metaphor.

Surely every human being who is at home with such contemplations has felt a deep distrust against any idealism of that kind, as often as he has distinctly convinced himself of the eternal rigidity, omnipresence, and infallibility of nature's laws: he has arrived at the conclusion that as far as we can penetrate the heights of the telescopic and the depths of the microscopic world, everything is quite secure, complete, infinite, determined, and continuous. Science will have to dig in these shafts eternally and successfully and all things found are sure to have to harmonize and not to contradict one another. How little does this resemble a product of fancy, for if it were one it would necessarily betray somewhere its nature of appearance and unreality. Against this it may be objected in the first place that if each of us had for himself a different sensibility, if we ourselves were only able to perceive sometimes as a bird, sometimes as a worm, sometimes as a plant, or if one of us saw the same stimulus as red, another as blue, if a third person even perceived it as a tone, then nobody would talk of such an orderliness of nature, but would conceive of her only as an extremely subjective structure. Secondly, what is, for us in general, a law of nature? It is not known in itself but only in its effects, that is to say, in its relations to other laws of nature, which again are known to us only as sums of relations. Therefore all these relations refer only one to another and are absolutely incomprehensible to us in their essence; only that which we add: time, space, i.e., relations of sequence and numbers, are really known to us in them. Everything wonderful, however, that we marvel at in the laws of nature, everything that demands an explanation and might seduce us into distrusting idealism, lies really and solely in the mathematical rigor and inviolability of the conceptions of time and space. These, however, we produce within ourselves and throw them forth with that necessity with which the spider spins; since we are compelled to conceive all things under these forms only,[9] then it is no longer wonderful that in all things we actually conceive none but these forms: for they all must bear within themselves the laws of number, and this very idea of number is the most marvelous in all things. All obedience to law which impresses us so forcibly in the orbits of stars and in chemical processes coincides at the bottom with those qualities which we ourselves attach to those things, so that it is we who thereby make the impression upon ourselves. Whence it clearly follows that the artistic formation of metaphors with which every sensation in us begins already presupposes those forms, and is therefore only consummated within them; only out of the persistency of these primal forms the possibility explains itself, how afterward out of the metaphors themselves a structure of ideas could again be compiled. For the latter is an imitation of the relations of time, space, and number in the realm of metaphors.

2

As we saw, it is *language* which has worked originally at the construction of ideas; in later times it is *science*. Just as the bee works at the same time at the cells and fills them with honey, thus science works irresistibly at that great columbarium of ideas, the cemetery of perceptions: builds ever newer and higher storeys; supports, purifies, renews the old cells; and endeavors above all to fill that gigantic framework and to arrange within it the whole of the empiric world, i.e., the anthropomorphic world. And as the man of action binds his life to reason and its ideas, in order to avoid being swept away and losing himself, so the seeker after truth builds his hut close to the towering edifice of science in order to collaborate with it and to find protection. And he needs protection. For there are awful powers which continually press upon him, and which hold out against the "truth" of science "truths" fashioned in quite another way, bearing devices of the most heterogeneous character.

That impulse toward the formation of metaphors, that fundamental impulse of man, which we cannot reason away for one moment—for thereby we should reason away man himself—is in truth not defeated nor even subdued by the fact that out of its evaporated products, the ideas, a regular and rigid new world has been built as a stronghold for it. This impulse seeks for itself a new realm of action and another river-bed, and finds it in *Mythos* and more generally in *Art*. This impulse constantly confuses the rubrics and cells of the ideas by putting up new figures of speech, metaphors, metonymies; it constantly shows its passionate longing for shaping the existing world of waking man as motley, irregular, inconsequently incoherent, attractive, and eternally new as the world of dreams is. For indeed, waking man per se is only clear about his being awake through the rigid and orderly woof of ideas, and it is for this very reason that he sometimes comes to believe that he was dreaming when that woof of ideas has for a moment been torn by Art. Pascal[10] is quite right when he asserts that if the same dream came to us every night, we should be just as much occupied by it as by the things which we see every day; to quote his words,

---

[9] Kant's time and space, pure forms in which all our experience is cast.

[10] Blaise Pascal (1623–1662), French philosopher.

"If an artisan were certain that he would dream every night for fully twelve hours that he was a king, I believe that he would be just as happy as a king who dreams every night for twelve hours that he is an artisan." The wideawake day of a people mystically excitable, let us say of the earlier Greeks, is in fact through the continually working wonder, which the mythos presupposes, more akin to the dream than to the day of the thinker sobered by silence. If every tree may at some time talk as a nymph, or a god under the disguise of a bull carry away virgins, if the goddess Athena herself be suddenly seen as, with a beautiful team, she drives, accompanied by Pisistratus, through the markets of Athens—and every honest Athenian did believe this—at any moment, as in a dream, everything is possible; and all nature swarms around man as if she were nothing but the masquerade of the gods, who found it a huge joke to deceive man by assuming all possible forms.

Man himself, however, has an invincible tendency to let himself be deceived, and he is like one enchanted with happiness when the rhapsodist narrates to him epic romances in such a way that they appear real or when the actor on the stage makes the king appear more kingly than reality shows him. Intellect, that master of dissimulation, is free and dismissed from his service as slave, so long as It is able to deceive without *injuring,* and then It celebrates Its Saturnalia.[11] Never is It richer, prouder, more luxuriant, more skillful and daring; with a creator's delight It throws metaphors into confusion, shifts the boundary stones of the abstractions, so that, for instance, It designates the stream as the mobile way which carries man to that place whither he would otherwise go. Now It has thrown off Its shoulders the emblem of servitude. Usually with gloomy officiousness It endeavors to point out the way to a poor individual coveting existence, and It fares forth for plunder and booty like a servant for his master, but now It Itself has become a master and may wipe from Its countenance the expression of indigence. Whatever It now does, compared with Its former doings, bears within itself dissimulation, just as Its former doings bore the character of distortion. It copies human life, but takes it for a good thing and seems to rest quite satisfied with it. That enormous framework and hoarding of ideas, by clinging to which needy man saves himself through life, is to the freed intellect only a scaffolding and a toy for Its most daring feats, and when It smashes it to pieces, throws it into confusion, and then puts it together ironically, pairing the strangest, separating the nearest items, then It manifests that It has no use for those makeshifts of misery, and that It is now no longer led by ideas but by intuitions. From these intuitions no regular road leads into the land of the spectral schemata, the abstractions; for them the word is not made, when man sees them he is dumb, or speaks in forbidden metaphors and in unheard-of combinations of ideas, in order to correspond creatively with the impression of the powerful present intuition at least by destroying and jeering at the old barriers of ideas.

There are ages, when the rational and the intuitive man stand side by side, the one full of fear of the intuition, the other full of scorn for the abstraction; the latter just as irrational as the former is inartistic. Both desire to rule over life; the one by knowing how to meet the most important needs with foresight, prudence, regularity; the other as an "overjoyous" hero by ignoring those needs and taking that life only as real which simulates appearance and beauty. Whenever intuitive man, as for instance in the earlier history of Greece, brandishes his weapons more powerfully and victoriously than his opponent, there under favorable conditions, a culture can develop and art can establish her rule over life. That dissembling, that denying of neediness, that splendor of metaphorical notions and especially that directness of dissimulation accompany all utterances of such a life. Neither the house of man, nor his way of walking, nor his clothing, nor his earthen jug suggest that necessity invented them; it seems as if they all were intended as the expressions of a sublime happiness, an olympic cloudlessness, and, as it were, a playing at seriousness. Whereas the man guided by ideas and abstractions only wards off misfortune by means of them, without even enforcing for himself happiness out of the abstractions; whereas he strives after the greatest possible freedom from pains, the intuitive man dwelling in the midst of culture has from his intuitions a harvest: besides the warding off of evil, he attains a continuous inpouring of enlightenment, enlivenment, and redemption. Of course when he *does* suffer, he suffers more: and he even suffers more frequently since he cannot learn from experience, but again and again falls into the same ditch into which he has fallen before. In suffering he is just as irrational as in happiness; he cries aloud and finds no consolation. How different matters are in the same misfortune with the Stoic, taught by experience and ruling himself by ideas! He who otherwise only looks for uprightness, truth, freedom from deceptions and shelter from ensnaring and sudden attack, in his misfortune performs the masterpiece of dissimulation, just as the other did in his happiness; he shows no twitching mobile human face but, as it were, a mask with dignified, harmonious features; he does not cry out and does not even alter his voice; when a heavy thundercloud bursts upon him, he wraps himself up in his cloak and with slow and measured step walks away from beneath it.

---

[11] Wild revelry.

Émile Zola

1840–1902

In an age of the rapid advance of science it was perhaps inevitable that many critics would perceive an opposition between poetry and science. It was likely also that some literary critics would seek to draw an analogy between artistic and scientific procedures, and that there would be various sorts of reactions against Romanticism and philosophical idealism, which had held the stage for many years. We see both of these latter attitudes in the French novelist Zola's *The Experimental Novel*. Unlike the Romantics, who distinguished literary from scientific practice, Zola sees the artist adopting the experimental method recommended by Claude Bernard (1813–1878) in his *Introduction à l'étude de la médecine experimentale*. Zola argues that the experimental novelist is neither a mere copyist of nature nor a photographer: "The idea of experiment carries with it the idea of modification." The novelist can use his "genius," but under control of experiment. The Romanticist dwelt "in the unknown for the pleasure of being there." The experimentalist voyages into the unknown to make it known. The "nonsense and folly" of Romantic lyricism will be diminished, and literature, it appears, will become what today we would call material for the social scientist. Though Zola used the term "experimental" to describe what he was trying to do, the term that is used most often to describe the type of novel he wrote is "naturalistic."

Zola rode the current of positivism and accepted the notion of material progress that accompanied it. His view raises, among other things, the problem of the value of the literature of the past. Since the science of the past has no specific current scientific value, presumably (to extend Zola's analogy), perhaps past literature has no value today. Zola cannot completely accept this; he suggests that ancient poems will survive because of their "beauty," but that sort of virtue is really for him quaint and archaic. Physiological man has replaced metaphysical man. Analytical procedures are the rule. Yet, by introducing that vague term "beauty" at the very end of his essay, Zola seems to admit the limitations of his own position if it were extended to a general theory.

A useful group of translations is *The Experimental Novel and Other Essays* by B. M. Sherman (1893). See F. Doucet, *L'Esthetique de Zola et son application a la critique* (1923); Matthew Josephson, *Zola and His Time* (1928); W. H. Root, *German Criticism of Zola 1875–1893* (1931); Edward Stone, *What Was Naturalism?* (1958); Philip D. Walker, *Émile Zola* (1969); Frederick Hemmings, *Life and Times of Émile Zola* (1977); Joanna Richardson, *Zola* (1978); David Baguley, ed., *Critical Essays on Émile Zola* (1986); Alan Schom, *Émile Zola: A Bourgeois Rebel* (1987); Jean Max Guieu and Alison Hilton, eds., *Émile Zola and the Arts* (1988); Anita Brookner, "Zola: Art for Life's Sake" in her *Romanticism and Its Discontents* (2000).

from
The Experimental Novel

In my literary essays I have often spoken of the application of the experimental method to the novel and to the drama. The return to nature, the naturalistic evolution which marks the century, drives little by little all the manifestation of human intelligence into the same scientific path. Only the idea of a literature governed by science is doubtless a surprise, until explained with precision and understood. It seems to me necessary, then, to say briefly and to the point what I understand by the experimental novel.

I really only need to adapt, for the experimental method has been established with strength and marvelous clearness by Claude Bernard in his *Introduction à l'étude de la médecine experimentale.*[1] This work, by a savant whose authority is unquestioned, will serve me as a solid foundation. I shall here find the whole question treated, and I shall restrict myself to irrefutable arguments and to giving the quotations which may seem necessary to me. This will then be but a compiling of texts, as I intend on all points to entrench myself behind Claude Bernard. It will often be but necessary for me to replace the word *doctor* by the word *novelist,* to make my meaning clear and to give it the rigidity of a scientific truth.

What determined my choice, and made me choose *L'Introduction* as my basis, was the fact that medicine, in the eyes of a great number of people, is still an art, as is the novel. Claude Bernard all his life was searching and battling to put medicine in a scientific path. In his struggle we see the first feeble attempts of a science to disengage itself little by little from empiricism,[2] and to gain a foothold in the realm of truth, by means of the experimental method. Claude Bernard demonstrates that this method, followed in the study of inanimate bodies in chemistry and in physics, should be also used in the study of living bodies, in physiology and medicine. I am going to try and prove for my part that if the experimental method leads to the knowledge of physical life, it should also lead to the knowledge of the passionate and intellectual life. It is but a question of degree in the same path which runs from chemistry to physiology, then from physiology to anthropology and to sociology. The experimental novel is the goal.

To be more clear, I think it would be better to give a brief résumé of *L'Introduction* before I commence. The applications which I shall make of the texts will be better understood if the plan of the work and the matters treated are explained.

Claude Bernard, after having declared that medicine enters the scientific path, with physiology as its foundation, and by means of the experimental method, first explains the differences which exist between the sciences of observation and the sciences of experiment. He concludes, finally, that experiment is but provoked observation. All experimental reasoning is based on doubt, for the experimentalist should have no preconceived idea, in the face of nature, and should always retain his liberty of thought. He simply accepts the phenomena which are produced, when they are proved.

In the second part he reaches his true subject and shows that the spontaneity of living bodies is not opposed to the employment of experiment. The difference is simply that an inanimate body possesses merely the ordinary, external environment, while the essence of the higher organism is set in an internal and perfected environment endowed with constant physicochemical properties exactly like the external environment; hence there is an absolute determinism in the existing conditions of natural phenomena; for the living as for the inanimate bodies. He calls determinism the cause which determines the appearance of these phenomena. This nearest cause, as it is called, is nothing more than the physical and material condition of the existence or manifestation of the phenomena. The end of all experimental method, the boundary of all scientific research, is then identical for living and for inanimate bodies; it consists in finding the relations which unite a phenomenon of any kind to its nearest cause, or, in other words, in determining the conditions necessary for the manifestation of this phenomenon. Experimental science has no necessity to worry itself about the "why" of things; it simply explains the "how."

After having explained the experimental considerations common to living beings and to inanimate, Claude Bernard passes to the experimental considerations which belong specially to living beings. The great and only difference is this, that there is presented to our consideration, in the organism of living beings, a harmonious group of phenomena. He then treats of practical experiments on living beings, of vivisection, of the preparatory anatomical conditions, of the choice of animals, of the use of calculation in the study of phenomena, and lastly of the physiologist's laboratory.

Finally, in the last part of *L'Introduction,* he gives some examples of physiological experimental investigations in

---

Le Roman expérimentale was first published in 1880. The text is from the translation by B. M. Sherman (1893).

[1] *Introduction to the Study of Experimental Medicine.*

[2] [Sherman] Zola uses *empiricism* in this essay in the sense of *haphazard observation* in contrast with a scientific experiment undertaken to prove a certain truth.

support of the ideas which he has formulated. He then furnishes some examples of experimental criticism in physiology. In the end he indicates the philosophical obstacles which the experimental doctor encounters. He puts in the first rank the false application of physiology to medicine, the scientific ignorance as well as certain illusions of the medical mind. Further, he concludes by saying that empirical medicine and experimental medicine, not being incompatible, ought, on the contrary, to be inseparable one from the other. His last sentence is that experimental medicine adheres to no medical doctrine nor any philosophical system.

This is, very broadly, the skeleton of *L'Introduction* stripped of its flesh. I hope that this rapid exposé will be sufficient to fill up the gaps which my manner of proceeding is bound to produce; for, naturally, I shall cite from the work only such passages as are necessary to define and comment upon the experimental novel. I repeat that I use this treatise merely as a solid foundation on which to build, but a foundation very rich in arguments and proofs of all kinds. Experimental medicine, which but lisps as yet, can alone give us an exact idea of experimental literature, which, being still unhatched, is not even lisping.

I

The first question which presents itself is this: Is experiment possible in literature, in which up to the present time observation alone has been employed?

Claude Bernard discusses observation and experiment at great length. There exists, in the first place, a very clear line of demarcation, as follows:

> The name of *observer* is given to him who applies the simple or complex process of investigation in the study of phenomena which he does not vary, and which he gathers, consequently, as nature offers them to him; the name of *experimentalist* is given to him who employs the simple and complex process of investigation to vary or modify, for an end of some kind, the natural phenomena, and to make them appear under circumstances and conditions in which they are not presented by nature.

For instance, astronomy is a science of observation, because you cannot conceive of an astronomer acting upon the stars; while chemistry is an experimental science, as the chemist acts upon nature and modifies it. This, according to Claude Bernard, is the only true and important distinction which separates the observer from the experimentalist.

* * *

To determine how much observation and experimenting there can be in the naturalistic novel, I only need to quote the following passages:

> The observer relates purely and simply the phenomena which he has under his eyes. . . . He should be the photographer of phenomena, his observation should be an exact representation of nature. . . . He listens to nature and he writes under its dictation. But once the fact is ascertained and the phenomenon observed, an idea or hypothesis comes into his mind, reason intervenes, and the experimentalist comes forward to interpret the phenomenon. The experimentalist is a man who, in pursuance of a more or less probable, but anticipated, explanation of observed phenomena, institutes an experiment in such a way that, according to all probability, it will furnish a result which will serve to confirm the hypothesis or preconceived idea. The moment that the result of the experiment manifests itself, the experimentalist finds himself face to face with a true observation which he has called forth, and which he must ascertain, as all observation, without any preconceived idea. The experimentalist should then disappear, or rather transform himself instantly into the observer, and it is not until after he has ascertained the absolute results of the experiment, like that of an ordinary observation, that his mind comes back to reasoning, comparing, and judging whether the experimental hypothesis is verified or invalidated by these same results.

The mechanism is all there. It is a little complicated, it is true, and Claude Bernard is led on to say:

> When all this passes into the brain of a savant who has given himself up to the study of a science as complicated as medicine still is, then there is such an entanglement between the result of observation and what belongs to experiment that it will be impossible and, besides, useless to try to analyze, in their inextricable *mélange,* each of these terms.

In one word, it might be said that observation "indicates" and that experiment "teaches."

Now, to return to the novel, we can easily see that the novelist is equally an observer and an experimentalist. The observer in him gives the fact as he has observed them, suggests the point of departure, displays the solid earth on which his characters are to tread and the phenomena to develop. Then the experimentalist appears and introduces an experiment, that is to say, sets his characters going in a certain story so as to show that the succession of facts will be such as the requirements of the determinism of the phenomena under examination call for. Here it is nearly always an experiment *"pour voir,"*[3] as Claude Bernard calls it. The novelist starts out in search of a truth. I will take as an example the character of the Baron Hulot, in *Cousine Bette,* by Balzac.[4] The general fact observed by Balzac is the ravages that the amorous temperament of a man makes in his home, in his family, and in society. As soon as he has chosen his subject he starts from known facts; then he makes his experiment, and exposes Hulot to a series of trials, placing him amid certain surroundings in order to exhibit how the complicated machinery of his passions works. It is then evident that there is not only observation there, but that there is also experiment; as Balzac does not remain satisfied with photographing the facts collected by him, but interferes in a direct way to place his character in certain conditions, and of these he remains the master. The problem is to know what such a passion, acting in such a surrounding and under such circumstances, would produce from the point of view of an individual and of society; and an experimental novel, *Cousine Bette,* for example, is simply the report of the experiment that the novelist conducts before the eyes of the public. In fact, the whole operation consists in taking facts in nature, then in studying the mechanism of these facts, acting upon them, by the modification of circumstances and surroundings, without deviating from the laws of nature. Finally, you possess knowledge of the man, scientific knowledge of him, in both his individual and social relations.

Doubtless we are still far from certainties in chemistry and even physiology. Nor do we know any more the reagents which decompose the passions, rendering them susceptible of analysis. Often, in this essay, I shall recall in similar fashion this fact, that the experimental novel is still younger than experimental medicine, and the latter is but just born. But I do not intend to exhibit the acquired results, I simply desire to clearly expose a method. If the experimental novelist is still groping in the most obscure and complex of all the sciences, this does not prevent this science from existing. It is undeniable that the naturalistic novel, such as we understand it today, is a real experiment that a novelist makes on man by the help of observation.

* * *

But see what splendid clearness breaks forth when this conception of the application of the experimental method to the novel is adequately grasped and is carried out with all the scientific rigor which the matter permits today. A contemptible reproach which they heap upon us naturalistic writers is the desire to be solely photographers. We have in vain declared that we admit the necessity of an artist's possessing an individual temperament and a personal expression; they continue to reply to us with these imbecile arguments, about the impossibility of being strictly true, about the necessity of arranging facts to produce a work of art of any kind. Well, with the application of the experimental method to the novel that quarrel dies out. The idea of experiment carries with it the idea of modification. We start, indeed, from the true facts, which are our indestructible basis; but to show the mechanism of these facts it is necessary for us to produce and direct the phenomena; this is our share of invention, here is the genius in the book. Thus without having recourse to the questions of form and of style, which I shall examine later, I maintain even at this point that we must modify nature, without departing from nature, when we employ the experimental method in our novels. If we bear in mind this definition, that "observation indicates and experiment teaches," we can even now claim for our books this great lesson of experiment.

* * *

I sum up this first part by repeating that the naturalistic novelists observe and experiment; and that all their work is the offspring of the doubt which seizes them in the presence of truths little known and phenomena unexplained, until an experimental idea rudely awakens their genius some day, and urges them to make an experiment, to analyze facts, and to master them.

II

. . . In the last century a more exact application of the experimental method creates physics and chemistry, which then are freed from the irrational and supernatural. Men discover that there are fixed laws, thanks to analysis, and make themselves masters of phenomena. Then a new point is gained. Living beings, in which the vitalists still admitted a mysterious influence, are in their turn brought under and reduced to the general mechanism of matter. Science proves that the existing conditions of all phenomena are the same in living beings as in inanimate; and from that time on physiology assumes little by little the certainty of chemistry and medicine. But are we going to stop there? Evidently not. When it has been proved that the body of a man is a machine, whose machinery can be taken apart and put together again at the will of the experimenter, then we can pass to the passionate and intellectual acts of man. Then we shall enter into the domain which up to the present has belonged to physiology and literature; it will be the decisive conquest by science of the hypotheses of philosophers and writers. We have experimental chemistry and medicine; we shall have an experimental physiology, and later on an experimental novel. It is an inevitable evolution, the goal of which it is easy to see today. All things hang together; it is necessary to start from the determinism of inanimate bodies in order to arrive at the determinism of living .beings; and since savants like Claude Bernard demonstrate now that fixed laws govern the human body, we can easily proclaim, without fear of being mistaken, the hour in which the laws of thought and passion will be formulated in their turn. A like determinism will govern the stones of the roadway and the brain of man.

---

[3] "In order to see."

[4] Honoré de Balzac (1799–1850), French novelist.

* * *

Now, science enters into the domain of us novelists, who are today the analyzers of man, in his individual and social relations. We are continuing, by our observations and experiments, the work of the physiologist, who has continued that of the physicist and the chemist. We are making use, in a certain way, of scientific psychology to complete scientific physiology; and to finish the series we have only to bring into our studies of nature and man the decisive tool of the experimental method. In one word, we should operate on the characters, the passions, on the human and social data, in the same way that the chemist and the physicist operate on inanimate beings, and as the physiologist operates on living beings. Determinism dominates everything. It is scientific investigation, it is experimental reasoning, which combats one by one the hypotheses of the idealists, and which replaces purely imaginary novels by novels of observation and experiment.

I certainly do not intend at this point to formulate laws. In the actual condition of the science of man the obscurity and confusion are still too great to risk the slightest synthesis. All that can be said is that there is an absolute determinism for all human phenomena. From that on investigation is a duty. We have the method; we should go forward, even if a whole lifetime of effort ends but in the conquest of a small particle of the truth. Look at physiology: Claude Bernard made grand discoveries, and he died protesting that he knew nothing, or nearly nothing. In each page he confesses the difficulties of his task. "In the phenomenal relations," he says,

> such as nature offers them to us, there always reigns a complexity more or less great. In this respect the complexity of mineral phenomena is much less great than that of living phenomena; this is why the sciences restricted to inanimate bodies have been able to formulate themselves more quickly. In living beings the phenomena are of enormous complexity, and the greater mobility of living organisms renders them more difficult to grasp and to define.

What can be said, then, of the difficulties to be encountered by the experimental novel, which adds to physiology its studies upon the most delicate and complex organs, which deals with the highest manifestations of man as an individual and a social member? Evidently analysis becomes more complicated here. Therefore, if the physiologist is but drawing up his principles today, it is natural that the experimental novelist should be only taking his first steps: we foresee it as a sure consequence of the scientific evolution of the century; but it is impossible to base it on certain laws. Since Claude Bernard speaks of "the restricted and precarious truths of biological science," we can freely admit that the truths of the science of man, from the standpoint of his intellectual and passionate mechanism, are more restricted and precarious still. We are lisping yet, we are the last comers, but that should be only one incentive the more to push us forward to more exact studies; now that we possess the tool, the experimental method, our goal is very plain—to know the determinism of phenomena and to make ourselves master of these phenomena.

Without daring, as I say, to formulate laws, I consider that the question of heredity has a great influence in the intellectual and passionate manifestations of man. I also attach considerable importance to the surroundings.[5] I ought to touch upon Darwin's[6] theories; but this is only a general study of the experimental method as applied to the novel, and I should lose myself were I to enter into details. I will only say a word on the subject of surroundings. We have just seen the great importance given by Claude Bernard to the study of those interorganic conditions which must be taken into account if we wish to find the determinism of phenomena in living beings. Well, then! In the study of a family, of a group of living beings, I think that the social condition is of equal importance. Someday the physiologist will explain to us the mechanism of the thoughts and the passions; we shall know how the individual machinery of each man works; how he thinks, how he loves, how he goes from reason to passion and folly; but these phenomena, resulting as they do from the mechanism of the organs, acting under the influence of an interior condition, are not produced in isolation or in the bare void. Man is not alone; he lives in society, in a social condition; and consequently, for us novelists, this social condition unceasingly modifies the phenomena. Indeed our great study is just there, in the reciprocal effect of society on the individual and the individual on society. For the physiologist, the exterior and interior conditions are purely chemical and physical, and this aids him in finding the laws which govern them easily. We are not yet able to prove that the social condition is also physical and chemical. It is that certainly, or rather it is the variable product of a group of living beings, who themselves are absolutely submissive to the physical and chemical laws which govern alike living beings and inanimate. From this we shall see that we can act upon the social conditions, in acting upon the phenomena of which we have made ourselves master in man. And this is what constitutes the experimental novel: to possess a knowledge of the mechanism of the phenomena inherent in man, to show the machinery of his intellectual and sensory manifestations, under the influences of heredity and environment, such as physiology shall give them to us, and then finally to exhibit man living in social conditions produced by himself, which he modifies daily, and in the heart of which he himself experiences a continual transformation. Thus, then, we lean on physiology; we take man from the hands of the physiologist solely, in order to continue the solution of the problem, and to solve scientifically the question of how men behave when they are in society.

---

[5] Taine (above, page 645).

[6] Charles Darwin's (1809–1882) *Origin of Species* had been published in 1859.

These general ideas will be sufficient to guide us today. Later on, when science is farther advanced, when the experimental novel has brought forth decisive results, some critic will explain more precisely what I have but indicated today.

* * *

I have reached this point: the experimental novel is a consequence of the scientific evolution of the century; it continues and completes physiology, which itself leans for support on chemistry and medicine; it substitutes for the study of the abstract and the metaphysical man the study of the natural man, governed by physical and chemical laws, and modified by the influences of his surroundings; it is in one word the literature of our scientific age, as the classical and Romantic literature corresponded to a scholastic and theological age. Now I will pass to the great question of the application of all this, and of its justification.

III

. . . This, then, is the end, this is the purpose in physiology and in experimental medicine: to make oneself master of life in order to be able to direct it. Let us suppose that science advances and that the conquest of the unknown is finally completed; the scientific age which Claude Bernard saw in his dreams will then be realized. When that time comes the doctor will be the master of maladies; he will cure without fail; his influence upon the human body will conduce to the welfare and strength of the species. We shall enter upon a century in which man, grown more powerful, will make use of nature and will utilize its laws to produce upon the earth the greatest possible amount of justice and freedom. There is no nobler, higher, nor grander end. Here is our role as intelligent beings: to penetrate to the wherefore of things, to become superior to these things, and to reduce them to a condition of subservient machinery.

Well, this dream of the physiologist and the experimental doctor is also that of the novelist, who employs the experimental method in his study of man as a simple individual and as a social animal. Their object is ours; we also desire to master certain phenomena of an intellectual and personal order, to be able to direct them. We are, in a word, experimental moralists, showing by experiment in what way a passion acts in a certain social condition. The day in which we gain control of the mechanism of this passion we can treat it and reduce it, or at least make it as inoffensive as possible. And in this consists the practical utility and high morality of our naturalistic works, which experiment on man, and which dissect piece by piece this human machinery in order to set it going through the influence of the environment. When things have advanced further, when we are in possession of the different laws, it will only be necessary to work upon the individuals and the surroundings if we wish to find the best social condition. In this way we shall construct a practical sociology, and our work will be a help to political and economical sciences. I do not know, I repeat, of a more noble work, nor of a grander application. To be the master of good and evil, to regulate life, to regulate society, to solve in time all the problems of socialism, above all, to give justice a solid foundation by solving through experiment the questions of criminality—is not this being the most useful and the most moral workers in the human workshop?

Let us compare, for one instant, the work of the idealistic novelists to ours; and here this word idealistic refers to writers who cast aside observation and experiment, and base their works on the supernatural and the irrational, who admit, in a word, the power of mysterious forces outside of the determinism of the phenomena. Claude Bernard shall reply to this for me:

> What distinguishes experimental reasoning from scholastic is the fecundity of the one and the sterility of the other. It is precisely the scholastic, who believes he has absolute certitude, who attains to no results. This is easily understood, since by his belief in an absolute principle he puts himself outside of nature, in which everything is relative. It is, on the contrary, the experimenter, who is always in doubt, who does not think he possesses absolute certainty about anything, who succeeds in mastering the phenomena which surround him, and in increasing his power over nature.

By and by I shall return to this question of the ideal, which is in truth but the question of indeterminism. Claude Bernard says truly: "The intellectual conquest of man consists in diminishing and driving back indeterminism, and so, gradually, by the aid of the experimental method, gaining ground for determinism." We experimental novelists have the same task; our work is to go from the known to the unknown, to make ourselves masters of nature; while the idealistic novelists deliberately remain in the unknown, through all sorts of religious and philosophical prejudices, under the astounding pretense that the unknown is nobler and more beautiful than the known. If our work, often cruel, if our terrible pictures needed justification, I should find, indeed, with Claude Bernard this argument conclusive:

> You will never reach really fruitful and luminous generalization on the phenomena of life until you have experimented yourself and stirred up in the hospital, the amphitheater, and the laboratory the fetid or palpitating sources of life. If it were necessary for me to give a comparison which would explain my sentiments on the science of life, I should say that it is a superb salon, flooded with light, which you can only reach by passing through a long and nauseating kitchen.

I insist upon the word which I have employed, that of experimental novelists as applied to naturalistic novelists. One page of *L'Introduction* struck me as being very forcible, that in which the author speaks of the vital "circulus."

> The muscular and nervous organs preserve the activity of the organs which make the blood; but the blood, in its turn, nourishes the organs which produce it. There is in this a social or organic solidarity, which keeps up a perpetual movement, until the derangement or cessation of the action of a necessary and vital element has broken the equilibrium or brought about some trouble or stoppage in the play of the animal machinery. The problem of the experimentalist doctor consists in finding the cause of any organic disarrangement, that is to say, in seizing the initial phenomenon. We shall see how a dislocation of the organism, or a disarrangement the most complex in appearance, can be traced to a simple initial cause, which calls forth immediately the most complex effects.

All that is necessary here is to change the words experimental doctor to experimental novelist, and this passage is exactly applicable to our naturalistic literature. The social circulus is identical with the vital circulus; in society, as in human beings, a solidarity exists which unites the different members and the different organisms in such a way that if one organ becomes rotten many others are tainted and a very complicated disease results. Hence, in our novels, when we experiment on a dangerous wound which poisons society, we proceed in the same way as the experimentalist doctor; we try to find the simple initial cause in order to reach the complex causes of which the action is the result. Go back once more to the example of Baron Hulot in *Cousine Bette.* See the final result, the dénouement of the novel: an entire family is destroyed, all sorts of secondary dramas are produced, under the action of Hulot's amorous temperament. It is there, in this temperament, that the initial cause is found. One member, Hulot, becomes rotten, and immediately all around him are tainted, the social circulus is interrupted, the health of that society is compromised. What emphasis Balzac lays on the character of Baron Hulot; with what scrupulous care he analyzes him! The experiment deals with him chiefly, because its object is to master the symptoms of this passion in order to govern it. Suppose that Hulot is cured, or at least restrained and rendered inoffensive, immediately the drama ceases to have any longer any *raison d'être*;[7] the equilibrium, or more truly the health, of the social body is again established. Thus the naturalistic novelists are really experimental moralists.

And I reach thus the great reproach with which they think to crush the naturalistic novelists, by treating them as fatalists. How many times have they wished to prove to us that as soon as we did not accept free will, that as soon as man was no more to us than a living machine, acting under the influence of heredity and surroundings, we should fall into gross fatalism, we should debase humanity to the rank of a troop marching under the baton of destiny. It is necessary to define our terms: we are not fatalists, we are determinists, which is not at all the same thing. Claude Bernard explains the two terms very plainly:

> We have given the name of determinism to the nearest or determining cause of phenomena. We never act upon the essence of phenomena in nature, but only on their determinism, and by this very fact, that we act upon it, determinism differs from fatalism, upon which we could not act at all. Fatalism assumes that the appearance of any phenomenon is necessary apart from its conditions, while determinism is just the conditions, essential for the appearance of any phenomenon, and such appearance is never forced. Once the search for the determinism of phenomena is placed as a fundamental principle of the experimental method, there is no longer either materialism, or spiritualism, or inanimate matter, or living matter; there remain but phenomena of which it is necessary to determine the conditions, that is to say, the circumstances which play, by their proximity to these phenomena, the role of nearest cause.

This is decisive. All we do is to apply this method in our novels, and we are the determinists who experimentally try to determine the condition of the phenomena, without departing in our investigations from the laws of nature. As Claude Bernard very truly says, the moment that we can act, and that we do act, on the determining cause of phenomena—by modifying their surroundings, for example—we cease to be fatalists.

Here you have, then, the moral purpose of the experimental novelist clearly defined. I have often said that we do not have to draw a conclusion from our works; and this means that our works carry their conclusion with them. An experimentalist has no need to conclude, because, in truth, experiment concludes for him.[8] A hundred times, if necessary, he will repeat the experiment before the public; he will explain it; but he need neither become indignant nor approve of it personally; such is the truth, such is the way phenomena work; it is for society to produce or not to produce these phenomena, according as the result is useful or dangerous. You cannot imagine, as I have said elsewhere, a savant being provoked with azote because azote is dangerous to life; he suppresses azote when it is harmful, and not otherwise. As our power is not the same as that of a savant, as we are experimentalists without being practitioners, we ought to content ourselves with searching out the determinism of social phenomena, and leaving to legislators and to men of affairs the care of controlling sooner or later these phenomena in such a way as to develop the good and reject the bad, from the point of view of their utility to man.

In our role as experimental moralists we show the mechanism of the useful and the useless, we disengage the determinism of the human and social phenomena so that, in their turn, the legislators can one day dominate and control these phenomena. In a word, we are working with the whole country toward that great object, the conquest of nature and the increase of man's power a hundredfold. Compare with ours the work of the idealistic writers, who rely upon the irrational and the supernatural, and whose every flight upward is followed by a deeper fall into metaphysical chaos. We are the ones who possess strength and morality.

IV

. . . If Claude Bernard confesses that the complexity of its phenomena will prevent medicine, for a long time yet, from arriving at a scientific state, what shall we say of the experimental novel, in which the phenomena are much more complicated still? But this does not prevent the novel from entering upon the scientific pathway, obedient to the general evolution of the century.

Moreover, Claude Bernard himself has indicated the evolutions of the human mind. "The human mind," he says,

> at various periods of its progress has passed successively through feeling, reason, and experiment.

---

[7] "Reason for being."

[8] This is an experimentalist or materialist view of the impersonal relation of author to work. An impersonal view was also developed apart from experimentalism and materialism in the twentieth century by Eliot (below, page 806) and subsequently the New Critics in opposition to Romantic emphasis on the work as an expression of the artist.

> First, feeling alone, dominating reason, created the truths of faith, that is to say, theology. Reason, or philosophy, becoming afterward the mistress, brought forth scholasticism. Finally, experiment, that is to say, the study of natural phenomena, taught man that the truths of the exterior world were to be found formulated, in the first place, neither in reason nor in feeling. These last are, indeed, our indispensable guides, but to obtain the truth it is necessary to descend into the objective reality of things, where they lie concealed under their phenomenal form. Thus it is that in the natural progress of things the experimental method appears, which sums up the whole, and which supports itself successfully on the three branches of this immovable tripod: feeling, reason, and experiment. In the search after truth by means of this method, feeling has always the initiative; it engenders the idea a priori or intuition; reason, or the reasoning power, immediately develops the idea and deduces its logical consequences. But if feeling must be guided by the light of reason, reason in its turn must be guided by experiment.

I have given this passage entire, as it is of the greatest importance. It shows clearly the role that the personality of the novelist should play, apart from the style. Since feeling is the starting point of the experimental method, since reason subsequently intervenes to end in experiment, and to be controlled by it, the genius of the experimentalist dominates everything, and this is what has made the experimental method, so inert in other hands, such a powerful tool in the hands of Claude Bernard. I have said the word: method is but the tool; it is the workman, it is the idea, which he brings, which makes the chef-d'oeuvre. I have already quoted these lines: "It is a particular feeling, a *quid proprium,*[9] which constitutes the originality, the invention, or the genius of each one." This, then, is the part taken by genius in the experimental novel. As Claude Bernard says again: "The idea is the seed; the method is the soil which furnishes the conditions for developing and prospering it, and bringing forth its best fruits, according to nature." Thus everything is reduced to a question of method. If you are content to remain in the a priori idea, and enjoy your own feelings without finding any basis for it in reason or any verification in experiment, you are a poet; you venture upon hypotheses which you cannot prove; you are struggling vainly in a painful indeterminism, and in a way that is often injurious. Listen to these lines of *L'Introduction:*

> Man is naturally a metaphysician and proud; he believes that the idealistic creations of his brain, which coincide with his feelings, represent the reality. Thus it follows that the experimental method is not innate and natural to man, for it is only after having wandered for a long time among theological and scholastical discussions that he ends by recognizing the sterility of his efforts in this path. Man then perceives that he cannot dictate laws to nature, because he does not possess in himself the knowledge and the criterion of exterior things; he realizes that in order to arrive at the truth he must, on the contrary, study the natural laws and submit his ideas, if not his reason, to experiment, that is to say, to the criterion of facts.

What becomes of the genius of the experimental novelist? The genius, the idea a priori, remains, only it is controlled by experiment. The experiment naturally cannot destroy his genius; on the contrary, it confirms it. To take the case of a poet, for example: To show he has genius is it necessary that his feeling, his idea, a priori, should be false? Evidently not, for the genius of a man will be so much the greater when experiment has proved the truth of his personal idea. Our age of lyricism, our Romantic disease, was alone capable of measuring a man's genius by the quantity of nonsense and folly which he put in circulation.[10] I conclude by saying that in our scientific century experiment must prove genius.

This is the drift of our quarrel with the idealistic writers. They always start out from an irrational source of some kind, such as a revelation, a tradition, or conventional authority. As Claude Bernard declares: "We must admit nothing occult; there are but phenomena and the conditions of phenomena." We naturalistic novelists submit each fact to the test of observation and experiment, while the idealistic writers admit mysterious elements which escape analysis, and therefore remain in the unknown, outside of the influence of the laws governing nature. This question of the ideal, from the scientific point of view, reduces itself to a question of indeterminate or determinate. All that we do not know, all that escapes us still, that is truly the ideal, and the aim of our human efforts is each day to reduce the ideal, to conquer truth from the unknown. We are all idealists, if we mean by this that we busy ourselves with the ideal. But I dub those idealists who take refuge in the unknown for the pleasure of being there, who have a taste but for the most risky hypotheses, who disdain to submit them to the test of experiment under the pretext that the truth is in themselves and not in the things. These writers, I repeat, accomplish a vain and harmful task, while the observer and the experimentalist are the only ones who work for the strength and happiness of man, making him more and more the master of nature. There is neither nobility, nor dignity, nor beauty, nor morality in not knowing, in lying, in pretending that you are greater according as you advance in error and confusion. The only great and moral works are those of truth.

---

[9] "Special thing."

[10] That Romanticism was diseased had been declared by Goethe, though Schiller claimed that Goethe was himself a Romantic. The notion was revived in the early part of the twentieth century by Irving Babbitt in his *Rousseau and Romanticism* (1919) and T. E. Hulme in his *Speculations* (written 1913–1914, published 1924), where he called Romanticism "spilt religion." Both writers influenced T. S. Eliot and the antiromanticism of the New Critics.

What we alone must accept is what I will call the stimulus of the ideal. Certainly our science is very limited as yet, beside the enormous mass of things of which we are ignorant. This great unknown which surrounds us ought to inspire us with the desire to pierce it, to explain it by means of scientific methods. And this does not refer only to scientific men; all the manifestations of human intelligence are connected together, all our efforts have their birth in the need we feel of making ourselves masters of the truth.

* * *

V

... I have already repeated twenty times that naturalism is not a personal fantasy, but that it is the intellectual movement of the century. Perhaps they will believe Claude Bernard, who speaks with greater authority on this subject than I can lay claim to; he declares that:

> The revolution which the experimental method has caused in science consists mainly in the substitution of a scientific criterion for a personal authority. It is the characteristic of the experimental method to depend only on itself, as it carries within itself its criterion, which is experiment. It recognizes no authority but that of facts, and it frees itself from personal authority.

Consequently, it no longer admits the authority of any theory either.

> The idea should always remain independent; it must be enchained neither by scientific, nor philosophical, nor religious beliefs. Man must be strong and free in the manifestation of his ideas, must follow his instinct, and not dwell upon the puerile fears of the contradiction of any theories . . . he must modify theory by adapting it to nature, and not nature by adapting it to theory.

From this there results an incomparable breadth.

> The experimental method is the scientific method which proclaims the liberty of thought. It not only throws off the philosophical and theological yoke, but it no longer admits scientific personal authority. This is not said from pride or boastfulness. The experimentalist, on the contrary, shows his humility in denying personal authority, for he doubts his own knowledge, and he submits the authority of men to that of experiment and the laws which govern nature.

This is why I have said so many times that naturalism is not a school, as it is not embodied in the genius of one man, nor in the ravings of a group of men, as was Romanticism; that it consists simply in the application of the experimental method to the study of nature and of man. Hence it is nothing but a vast movement, a march forward in which everyone is a workman, according to his genius. All theories are admitted, and the theory which carries the most weight is the one which explains the most. There does not appear to me to be a literary or scientific path larger or more direct. Everyone, the great and the small, moves freely, working and investigating together, each one in his own specialty, and recognizing no other authority than that of facts proved by experiment. Therefore in naturalism there could be neither innovators nor leaders; there are simply workmen, some more skillful than others.

. . . I have said that in the experimental novel it is best for us to hold to the strictly scientific point of view if we wish to base our studies on solid ground; not to go out from the "how," not to attach ourselves to the "why." However, it is very certain that we cannot always escape this need of our intelligence, this restless curiosity which makes us desire to know the essence of things. I think that it is best for us to accept the philosophical system, which adapts itself the best to the actual condition of the sciences, but simply from a speculative point of view. For example, transformism is actually the most rational system, and is the one which is based most directly upon our knowledge of nature. Behind a science, behind a manifestation of any kind of the human intelligence, there always lies more or less clearly what Claude Bernard calls a philosophical system. To this system it is not well to attach oneself devotedly, but to hold tenaciously to the facts, free to modify the system if the facts call for it. But the system exists nonetheless, and it exists so much the more as science is less advanced and less firm. For us naturalistic novelists, who are still in the lisping stage, hypothesis is fatal. By and by I will take up the role of hypothesis in literature.

Nevertheless, if in practice Claude Bernard thrusts aside philosophical system, he recognizes the necessity of philosophy.

> From a scientific point of view, philosophy represents the eternal desire of the human reason after knowledge of the unknown. Hence philosophers always confine themselves to questions that are in dispute, and to those lofty regions that lie beyond the boundaries of science. In this way they communicate to science a certain inspiration which animates and ennobles it. They strengthen the mind—developing it by an intellectual gymnastics—at the same time that they ever carry it toward the never-completed solution of great problems. Thus they keep up a cult of the unknown, and quicken the sacred fire of investigation, which ought never to be extinguished in the heart of a savant.

This passage is very fine, but the philosophers have never been told in better terms that their hypotheses are pure poetry. Claude Bernard evidently looks upon the philosophers, among whom he believes he has a great many friends, as musicians often gifted with genius, whose music encourages the savants while they work and inspires the sacred fire of their great discoveries. But the philosophers, left to themselves, will sing forever and never discover a single truth.

I have neglected until now the question of form in the naturalistic novel, because it is precisely there that individuality shows in literature. Not only is a writer's genius to be found in the feeling and in the idea a priori but also in the form and style. But the question of method and the question of rhetoric are distinct from each other. And by naturalism, I say again, is meant the experimental method, the introduction of observation and experiment into literature. Rhetoric, for the moment, has no place here. Let us first fix upon the method, on which there should be agreement, and after that accept all the different styles in letters which may be produced, looking upon them as the expressions of the literary temperament of the writers.

If you wish my true opinion upon this subject, it is this: that today an exaggerated importance is given to form. I have a great deal to say on this subject, but it would carry me beyond the limits of this essay. In reality, I think that the form of expression depends upon the method: that language is only one kind of logic and its construction natural and scientific. He who writes the best will not be the one who gallops madly among hypotheses, but the one who walks straight ahead in the midst of truths. We are actually rotten with lyricism; we are very much mistaken when we think that the characteristic of a good style is a sublime confusion with just a dash of madness added; in reality, the excellence of a style depends upon its logic and clearness.

Claude Bernard considers that philosophers are really musicians who play a sort of *Marseillaise* made up of hypotheses, and swell the hearts of the savants as they rush to attack the unknown; and he has much the same idea of artists and writers. I have remarked that a great many of the most intelligent savants, jealous of the scientific certainty which they enjoy, would very willingly confine literature to the ideal. They themselves seem to feel the need of taking little recreations in the world of lies after the fatigue of their exact labors, and they are fond of amusing themselves with the most daring hypotheses, and with fictions which they know perfectly well to be false and ridiculous. Claude Bernard was right when he said: "Literary and artistic productions will never grow old in the sense that they are the expressions of sentiments as unchangeable as human nature." In fact, form is sufficient to immortalize a work; the spectacle of a powerful individuality reproducing nature in superb language will interest all ages; only the works of a savant, from this same point of view, will be read always, for the reason that the thought of a great savant who knows how to write is much more interesting than that of a poet. However far astray the savant may be in his hypothesis, he still remains the equal of the poet, who is certain to have been equally mistaken. The point to be emphasized is this that our domain is not limited to the expression of sentiments as unchangeable as human nature because it is essential also to exhibit the working of these sentiments.

We have not exhausted our matter when we have depicted anger, avarice, and love; all nature and all of man belong to us, not only in their phenomena, but in the causes o these phenomena. I well know that this is an immense field the entrance to which they would willingly have refused us but we have broken down the barriers and have entered it i triumph. This is why I do not accept the following words o Claude Bernard: "In art and letters personality dominate everything. There one is dealing with a spontaneous creatio of the mind that has nothing in common with the verificatio of natural phenomena, in which our minds can create nothing." I have here detected one of our most illustrious savants sharing in the attempt to refuse to letters the entrée to the scientific field. I do not know what letters he refers to in this definition of a literary work: "A spontaneous creation of the mind that has nothing in common with the verification of natural phenomena." Doubtless he has lyrical poetry in his mind, for he never could have written that phrase had he understood the experimental novel as shown in the works of Balzac and Stendhal.[11] I can only repeat what I have said before, that apart from the matter of form and style, the experimental novelist is only one special kind of savant, who makes use of the tools of all other savants, observation and analysis. Our field is the same as the physiologist's, only that it is greater. We operate, like him, on man; and Claude Bernard recognizes this fact himself, that the cerebral phenomena can be determined the same as other phenomena. It is true that Claude Bernard can tell us that we are lost in hypotheses; but to conclude from this that we shall never arrive at the truth sits very badly on him; as he has struggled all his life to make a science of medicine, which the great majority of his contemporaries look upon as an art.

Let us clearly define now what is meant by an experimental novelist. Claude Bernard gives the following definition of an artist: "What is an artist? He is a man who realizes in a work of art an idea or a sentiment which is personal to him." I absolutely reject this definition. On this basis if I represented a man as walking on his head, I should have made a work of art, if such happened to be my personal sentiments. But in that case I should be a fool and nothing else. So one must add that the personal feeling of the artist is always subject to the higher law of truth and nature. We now come to the question of hypothesis. The artist starts out from the same point as the savant; he places himself before nature, has an idea a priori, and works according to this idea. Here alone he separates himself from the savant, if he carries out his idea to the end without verifying its truth by the means of observation and experiment. Those who make use of experiment might well be called experimental artists; but then people will tell us that they are no longer artists, since such people regard art as the burden of personal error which the artist has put into his study of nature. I contend that the personality of the writer should only appear in the idea a priori and in the form, not in the infatuation for the false. I see no objection, besides, to its showing in the hypothesis, but it is necessary to clearly understand what you mean by these words.

It has often been said that writers ought to open the way for savants. This is true, for we have seen in *L'Introduction* that hypothesis and empiricism precede and prepare for the scientific state which is established finally by the experimental method. Man commenced by venturing certain explanations of phenomena, the poets gave expression to their emotions, and the savants ended by mastering hypotheses and fixing the truth; Claude Bernard always assigns the role of pioneers to the philosophers. It is a very noble role, and today it is the writers who should assume it and who should endeavor to fill it worthily. Only let it be well understood that each time that a truth is established by the savants the writers should immediately abandon their hypothesis to adopt this truth; otherwise they will remain deliberately in error without benefiting anyone. It is thus that science, as it advances, furnishes to us writers a solid ground upon which we should lean for support, to better enable us to shoot into new hypotheses. In a word, every phenomenon, once clearly determined, destroys the hypothesis which it replaces, and it is then necessary to transport your hypothesis one step further into the new unknown which arises. I will take a very simple example in order to make myself better understood: it has been proved that the earth revolves around the sun; what would you think of a poet who should adopt the old belief that the sun revolves around the earth? Evidently the poet, if he wishes to risk a personal explanation of any fact, should choose a fact whose cause is not already known. This, then, illustrates the position hypothesis should occupy for experimental novelists; we must accept determined facts, and not attempt to risk about them our personal sentiments, which would be ridiculous, building throughout on the territory that science has conquered; then before the unknown, but only then, exercising our intuition and suggesting the way to science, free to make mistakes, happy if we produce any data toward the solution of the problem. Here I stand at Claude Bernard's practical program, who is forced to accept empiricism as a necessary forerunner. In our experimental novel we can easily risk a few hypotheses on the question of heredity and surroundings, after having respected all that science knows today about the matter. We can prepare the ways, we can furnish the results of observation, human data which may prove very useful. A great lyrical poet has written lately that our century is a century of prophets. Yes, if you wish it; only let it be well understood that these prophets rely neither upon the irrational nor the supernatural. If the prophets thought best to bring up again the most elementary notions, to serve up nature with a strange religious and philosophical sauce, to hold fast to the metaphysical man, to confound and obscure everything, the prophets, notwithstanding their genius in the matter of style, would never be anything but great gooses ignorant whether they would get wet if they jumped into the water. In our scientific age it is a very delicate thing to be a prophet, as we no longer believe in the truths of revelation, and in order to be able to foresee the unknown we must begin by studying the known.

---

[11] Stendhal (Marie Henri Beyle, 1783–1842), French novelist.

The conclusion to which I wish to come is this: If I were to define the experimental novel I should not say, as Claude Bernard says, that a literary work lies entirely in the personal feeling, for the reason that in my opinion the personal feeling is but the first impulse. Later nature, being there, makes itself felt, or at least that part of nature of which science has given us the secret, and about which we have no longer any right to romance. The experimental novelist is therefore the one who accepts proven facts, who points out in man and in society the mechanism of the phenomena over which science is mistress, and who does not interpose his personal sentiments, except in the phenomena whose determinism is not yet settled, and who tries to test, as much as he can, this personal sentiment, this idea a priori, by observation and experiment.

I cannot understand how our naturalistic literature can mean anything else. I have only spoken of the experimental novel, but I am fairly convinced that the same method, after having triumphed in history and in criticism, will triumph everywhere, on the stage and in poetry even. It is an inevitable evolution. Literature, in spite of all that can be said, does not depend merely upon the author; it is influenced by the nature it depicts and by the man whom it studies. Now if the savants change their ideas of nature, if they find the true mechanism of life, they force us to follow them, to precede them even, so as to play our role in the new hypotheses. The metaphysical man is dead; our whole territory is transformed by the advent of the physiological man. No doubt "Achilles' Anger," "Dido's Love,"[12] will last forever on account of their beauty; but today we feel the necessity of analyzing anger and love, of discovering exactly how such passions work in the human being. This view of the matter is a new one; we have become experimentalists instead of philosophers. In short, everything is summed up in this great fact: the experimental method in letters, as in the sciences, is in the way to explain the natural phenomena, both individual and social, of which metaphysics, until now, has given only irrational and supernatural explanations.

[12] Reference to themes in *Iliad* and *Odyssey* respectively.

Oscar Wilde

1854–1900

Wilde's writings are now taken much more seriosuly than they were for decades after his death. Perhaps the Arnoldian desire for high seriousness conflicted with Wilde's way of putting things, which, was witty and often impertinent. Beneath the transvaluations of *The Decay of Lying,* which, along with *The Critic as Artist,* is his most famous piece of criticism, lie significant theoretical implications. Wilde recognized that the theory of imitation had undergone a crucial change. The trend since Kant (above, page 416) and Coleridge (above, page 493) had been to emphasize art's power to *make,* less to *copy.* Art came to be seen as affecting our perception of the world. Wilde proceeds farther; he argues that life and nature imitate art more than art imitates life and nature. His fictional critic Vivian comically blames the fogs of London on certain painters of the nineteenth century. The exaggeration is made to show that we view the world in frameworks that we have been taught. Art, in the restricted sense of fine art, may not be responsible for as much of our world as Vivian claims, but when it is seen to include the popular arts, such as television and advertising, it certainly does affect the way we experience things. No doubt the fine arts help to build up the sense of a more complex and intense world than do the popular arts. Much in modern philosophy, psychology, and sociology reflects this Wildean idea.

Wilde has Vivian take another Kantian idea to an extreme. Vivian argues against usefulness as an element of the art object. Kant did not assert that art objects cannot be useful; instead he held that to judge an art object with respect to its use is not to make an aesthetic judgment. Vivian argues more radically that the art object should have no use. He associates use with verbal content—that is, something that can be abstracted from the work and judged true or false by some process of verification or recourse to an *a priori* set of moral values. He also associates the concept of use with materialistic and utilitarian attitudes. According to Vivian truth in art (actually "lies") is a matter only of style. In this argument we see a return to the Romantic effort to distinguish poetry from discursive argumentation and scientific procedures. Earlier, Sidney (above, page 198) remarked that the poet does not lie because he never affirms. Vivian is not content with that, still less with arguments defending art because it leads us to some Platonic idea. He sees art as a formative force in culture. Why does Vivian speak of art as lying? Because he recognizes the dominance in his time of scientific and discursive modes of structuring our reality, and he wishes to attack this dominance—in his view a terrible imbalance—by the shocking ironic inversion of normal terminology. If only naturalism and science bring truth, then art brings lies, and Vivian chooses lies.

It is to be noticed that, like Plato, Wilde writes a dialogue. This is consistent with his view that the critic is an artist. In the dialogue *The Critic as Artist* Wilde has his character Gilbert say, "Man is least himself when he talks in his own person. Give him a mask and he will tell you the truth."

Hesketh Pearson has edited Wilde's complete work (1936) and his essays (1950). Wilde's criticism is also available in *The Artist as Critic: Critical Writings of Oscar Wilde,* edited by Richard Ellmann (1969). See Arthur Symons, *A Study of Oscar Wilde* (1930); William Gaunt, *The Aesthetic Adventure* (1945); George Woodcock, *The Paradox of Oscar Wilde* (1949); St. John Ervine, *Oscar Wilde* (1952); Kevin Sullivan, *Oscar Wilde* (1972); Ronald Ericksen, *Oscar Wilde* (1972); Christopher Nassaar, *Into the Demon Universe* (1974); Richard Ellmann, *Oscar Wilde* (1988); Regenia Gagnier, ed., *Critical Essays on Oscar Wilde* (1991); Patricia Flanagan Behrendt, *Oscar Wilde: Eros and Aesthetics* (1991); Guy Willoughby, *Art and Christhood: The Aesthetics of Oscar Wilde* (1993); Anne Varty, *A Preface to Oscar Wilde* (1998); Boris Bashford, *Oscar Wilde: The Critic of Humanism* (1999).

The Decay of Lying

Cyril *(Coming in through the open window from the terrace.)* My dear Vivian, don't coop yourself up all day in the library. It is a perfectly lovely afternoon. The air is exquisite. There is a mist upon the woods, like the purple bloom upon a plum. Let us go and lie on the grass, and smoke cigarettes, and enjoy nature.

Vivian[1] Enjoy nature! I am glad to say that I have entirely lost that faculty. People tell us that art makes us love nature more than we loved her before; that it reveals her secrets to us; and that after a careful study of Corot and Constable[2] we see things in her that had escaped our observation. My own experience is that the more we study art, the less we care for nature. What art really reveals to us is nature's lack of design, her curious crudities, her extraordinary monotony, her absolutely unfinished condition. Nature has good intentions, of course, but, as Aristotle once said, she cannot carry them out.[3] When I look at a landscape I cannot help seeing all its defects. It is fortunate for us, however, that nature is so imperfect, as otherwise we should have had no art at all. Art is our spirited protest, our gallant attempt to teach nature her proper place. As for the infinite variety of nature, that is a pure myth. It is not to be found in nature herself. It resides in the imagination, or fancy, or cultivated blindness of the man who looks at her.

Cyril Well, you need not look at the landscape. You can lie on the grass and smoke and talk.

Vivian But nature is so uncomfortable. Grass is hard and lumpy and damp, and full of dreadful black insects. Why, even Morris'[4] poorest workman could make you a more comfortable seat than the whole of nature can. Nature pales before the furniture of "the street which from Oxford has borrowed its name," as the poet you love so much once vilely phrased it. I don't complain. If nature had been comfortable, mankind would never have invented architecture, and I prefer houses to the open air. In a house we all feel of the proper proportions. Everything is subordinated to us, fashioned for our use and our pleasure. Egotism itself, which is so necessary to a proper sense of human dignity, is entirely the result of indoor life. Out of doors one becomes abstract and impersonal. One's individuality absolutely leaves one. And then nature is so indifferent, so unappreciative. Whenever I am walking in the park here I always feel that I am no more to her than the cattle that browse on the slope, or the burdock that blooms in the ditch. Nothing is more evident than that nature hates mind. Thinking is the most unhealthy thing in the world, and people die of it just as they die of any other disease. Fortunately, in England, at any rate, thought is not catching. Our splendid physique as a people is entirely due to our national stupidity. I only hope we shall be able to keep this great historic bulwark of our happiness for many years to come; but I am afraid that we are beginning to be overeducated; at least, everybody who is incapable of learning has taken to teaching—that is really what our enthusiasm for education has come to. In the meantime, you had better go back to your wearisome uncomfortable nature, and leave me to correct my proofs.

Cyril Writing an article! That is not very consistent after what you have just said.

Vivian Who wants to be consistent? The dullard and the doctrinaire, the tedious people who carry out their principles to the bitter end of action, to the *reductio ad*

The Decay of Lying was first published in 1889.

[1] Vivian and Cyril were the names of Wilde's two sons.

[2] Jean Baptiste Camille Corot (1796–1875), French landscape painter; John Constable (1776–1837), English landscape painter.

[3] *Poetics* (above, page 48).

[4] William Morris (1834–1896), English writer and designer.

absurdum of practice. Not I. Like Emerson,[5] I write over the door of my library the word *whim*. Besides, my article is really a most salutary and valuable warning. If it is attended to, there may be a new Renaissance of art.

Cyril What is the subject?

Vivian I intend to call it *The Decay of Lying: A Protest.*

Cyril Lying! I should have thought that our politicians kept up that habit.

Vivian I assure you that they do not. They never rise beyond the level of misrepresentation, and actually condescend to prove, to discuss, to argue. How different from the temper of the true liar, with his frank, fearless statements, his superb irresponsibility, his healthy, natural disdain of proof of any kind! After all, what is a fine lie? Simply that which is its own evidence. If a man is sufficiently unimaginative to produce evidence in support of a lie, he might just as well speak the truth at once. No, the politicians won't do. Something may, perhaps, be urged on behalf of the bar. The mantle of the sophist has fallen on its members. Their feigned ardors and unreal rhetoric are delightful. They can make the worse appear the better cause, as though they were fresh from Leontine[6] schools, and have been known to wrest from reluctant juries triumphant verdicts of acquittal for their clients, even when those clients, as often happens, were clearly unmistakably innocent. But they are briefed by the prosaic, and are not ashamed to appeal to precedent. In spite of their endeavors, the truth will out. Newspapers, even, have degenerated. They may now be absolutely relied upon. One feels it as one wades through their columns. It is always the unreadable that occurs. I am afraid that there is not much to be said in favor of either the lawyer or the journalist. Besides, what I am pleading for is lying in art. Shall I read you what I have written? It might do you a great deal of good.

Cyril Certainly, if you give me a cigarette. Thanks. By the way, what magazine do you intend it for?

Vivian For the *Retrospective Review.* I think I told you that the elect had revived it.

Cyril Whom do you mean by "the elect"?

Vivian Oh, The Tired Hedonists, of course. It is a club to which I belong. We are supposed to wear faded roses in our buttonholes when we meet, and to have a sort of cult for Domitian.[7] I am afraid you are not eligible. You are too fond of simple pleasures.

Cyril I should be blackballed on the ground of animal spirits, I suppose?

Vivian Probably. Besides, you are a little too old. We don't admit anybody who is of the usual age.

Cyril Well, I should fancy you are all a good deal bored with each other.

Vivian We are. That is one of the objects of the club. Now, if you promise not to interrupt too often, I will read you my article.

Cyril You will find me all attention.

Vivian *(Reading in a very clear, musical voice.)* "*The Decay of Lying: A Protest.* One of the chief causes that can be assigned for the curiously commonplace character of most of the literature of our age is undoubtedly the decay of lying as an art, a science, and a social pleasure. The ancient historians gave us delightful fiction in the form of fact; the modern novelist presents us with dull facts under the guise of fiction. The blue book is rapidly becoming his ideal both for method and manner. He has his tedious *document humain,* his miserable little *coin de la creation,*[8] into which he peers with his microscope. He is to be found at the Librairie Nationale, or at the British Museum, shamelessly reading up his subject. He has not even the courage of other people's ideas, but insists on going directly to life for everything, and ultimately, between encyclopedias and personal experience, he comes to the ground, having drawn his types from the family circle or from the weekly washerwoman, and having acquired an amount of useful information from which never, even in his most meditative moments, can he thoroughly free himself.

"The loss that results to literature in general from this false ideal of our time can hardly be overestimated. People have a careless way of talking about a 'born liar,' just as they talk about a 'born poet.' But in both cases they are wrong. Lying and poetry are arts—arts, as Plato saw, not unconnected with each other[9]—and they require the most careful study, the most disinterested devotion. Indeed, they have their technique, just as the more material arts of painting and sculpture have, their subtle secrets of form and color, their craft mysteries, their deliberate artistic methods. As one knows the poet by his fine music, so one can recognize the liar by his rich rhythmic utterance, and in neither case will the casual inspiration of the moment suffice. Here, as elsewhere, practice must precede perfection. But in modern days while the fashion of writing poetry has become far too common, and should, if possible, be discouraged, the fashion of lying has almost fallen in disrepute. Many a young man starts in life with a natural gift for exaggeration which, if nurtured in congenial and sympathetic surroundings, or by the imitation of the best models, might grow into something really great and wonderful. But, as a rule, he comes to nothing. He either falls into careless habits of accuracy—"

---

[5] Emerson (above, page 566).

[6] Gorgias (c. 485–c. 380 B.C.), Greek sophist and teacher of rhetoric, was from Leontini.

[7] Domitian (51–96), Roman emperor (81–96).

[8] "Corner of creation."

[9] *Republic* (above, page 19), but Plato saw lying as a fault.

Cyril My dear fellow!

Vivian Please don't interrupt in the middle of a sentence. "He either falls into careless habits of accuracy, or takes to frequenting the society of the aged and the well-informed. Both things are equally fatal to his imagination, as indeed they would be fatal to the imagination of anybody, and in a short time he develops a morbid and unhealthy faculty of truth-telling, begins to verify all statements made in his presence, has no hesitation in contradicting people who are much younger than himself, and often ends by writing novels which are so like life that no one can possibly believe in their probability. This is no isolated instance that we are giving. It is simply one example out of many; and if something cannot be done to check, or at least to modify, our monstrous worship of facts, art will become sterile, and beauty will pass away from the land.

"Even Mr. Robert Louis Stevenson,[10] that delightful master of delicate and fanciful prose, is tainted with this modern vice, for we know positively no other name for it. There is such a thing as robbing a story of its reality by trying to make it too true, and *The Black Arrow* is so inartistic as not to contain a single anachronism to boast of, while the transformation of Dr. Jekyll reads dangerously like an experiment out of the *Lancet.*[11] As for Mr. Rider Haggard,[12] who really has, or had once, the makings of a perfectly magnificent liar, he is now so afraid of being suspected of genius that when he does tell us anything marvelous, he feels bound to invent a personal reminiscence, and to put it into a footnote as a kind of cowardly corroboration. Nor are our other novelists much better. Mr. Henry James[13] writes fiction as if it were a painful duty, and wastes upon mean motives and imperceptible 'points of view' his neat literary style, his felicitous phrases, his swift and caustic satire. Mr. Hall Caine,[14] it is true, aims at the grandiose, but then he writes at the top of his voice. He is so loud that one cannot hear what he says. Mr. James Payn[15] is an adept in the art of concealing what is not worth finding. He hunts down the obvious with the enthusiasm of a shortsighted detective. As one turns over the pages, the suspense of the author becomes unbearable. The horses of Mr. William Black's[16] phaeton do not soar towards the sun. They merely frighten the sky at evening into violent chromolithographic effects. On seeing them approach, the peasants take refuge in dialect. Mrs. Oliphant[17] prattles pleasantly about curates, lawn-tennis parties, domesticity, and other wearisome things. Mr. Marion Crawford[18] has immolated himself upon the altar of local color. He is like the lady in the French comedy who talks about *le beau ciel d'Italie.*[19] Besides, he has fallen into a bad habit of uttering moral platitudes. He is always telling us that to be good is to be good, and that to be bad is to be wicked. At times he is almost edifying. *Robert Elsemere* is, of course, a masterpiece—a masterpiece of the *genre ennuyeux,*[20] the one form of literature that the English people seem to thoroughly enjoy. A thoughtful young friend of ours once told us that it reminded him of the sort of conversation that goes on at a meat tea in the house of a serious Nonconformist family, and we can quite believe it. Indeed it is only in England that such a book could be produced. England is the home of lost ideas. As for that great and daily increasing school of novelists for whom the sun always rises in the East End, the only thing that can be said about them is that they find life crude, and leave it raw.

"In France, though nothing so deliberately tedious as *Robert Elsemere* has been produced, things are not much better. M. Guy de Maupassant,[21] with his keen mordant irony and his hard vivid style, strips life of the few poor rags that still cover her, and shows us foul sore and festering wounds. He writes lurid little tragedies in which everybody is ridiculous; bitter comedies at which one cannot laugh for very tears. M. Zola, true to the lofty principle that he lays down in one of his *pronunciamientos* on literature, '*L'homme de génie n'a jamais d'esprit,*[22] is determined to show that, if he has not got genius, he can at least be dull. And how well he succeeds! He is not without power. Indeed at times, as in *Germinal,* there is something almost epic in his work. But his work is entirely wrong from beginning to end, and wrong not on the ground of morals, but on the ground of art. From any ethical standpoint it is just what it should be. The author is perfectly truthful and describes things exactly as they happen. What more can any moralist desire? We have no sympathy at all with the moral indignation of our time against M. Zola. It is simply the indignation of Tartuffe[23] on being exposed. But from the standpoint of art, what can be said in favor of the author of *L'Assommoir, Nana,* and *Pot-Bouille?* Nothing. Mr. Ruskin[24] once described the characters in George Eliot's[25] novels as being like the sweepings of a Pentonville omnibus, but M. Zola's characters are much worse. They have their dreary vices, and their drearier virtues. The record of their lives is absolutely without interest. Who cares what happens to them? In literature we require distinction, charm, beauty, and imaginative power. We don't want to be harrowed and disgusted with an account of the doings of the lower orders. M. Daudet[26] is better. He has wit, a light touch, and an amusing style. But he has lately committed literary suicide. Nobody can possibly care for Delobelle with his *'Il fault lutter pour l'art,'*[27] or for Valmajour with his eternal refrain about the nightingale, or for the poet in *Jack* with his *'mots cruels,'*[28] now that we have learned from *Vingt ans de ma vie littéraire*[29] that these characters were taken directly from life. To us they seem to have suddenly lost all their vitality, all the few qualities they ever possessed. The only real people are the people who never existed, and if a novelist is base enough to go to life for his personages he should at least pretend that they are creations, and not boast of them as copies. The justification of a character in a novel is not that other persons are what they are, but that the author is what he is. Otherwise the novel is not a work of art. As for M. Paul Bourget, the master of the *roman psychologique,*[30] he commits the error of imagining that the men and women of modern life are capable of being infinitely analyzed for an innumerable series of chapters. In point of fact, what is interesting about people in good society—and M. Bourget rarely moves out of the Faubourg St. Germain, except to come to London—is the mask that each one of them wears, not the reality that lies behind the mask. It is a humiliating confession, but we are all of us made out of the same stuff. In Falstaff there is something of Hamlet, in Hamlet there is not a little of Falstaff. The fat knight has his moods of melancholy, and the young prince his moments of coarse humor. Where we differ from each other is purely in accidentals: in personal appearance, tricks of habit, and the like. The more one analyzes people, the more all reasons for analysis disappear. Sooner or later one comes to that dreadful universal thing called human nature. Indeed, as anyone who has ever worked among the poor knows only too well, the brotherhood of man is no mere poet's dream, it is a most depressing and humiliating reality; and if a writer insists upon analyzing the upper classes, he might just as well write of match-girls and costermongers at once." However, my dear Cyril, I will not detain you any further just here. I quite admit that modern novels have many good points. All I insist on is that, as a class, they are quite unreadable.

---

[10] Robert Louis Stevenson (1850–1894), Scottish novelist.
[11] *The Lancet,* English medical journal.
[12] Henry Rider Haggard (1869–1925), English novelist.
[13] Henry James (1843–1916), American novelist who lived in England.
[14] Thomas Henry Hall Caine (1853–1931), English novelist and dramatist.
[15] James Payn (1830–1898), English writer.
[16] William Black (1841–1898), Scottish novelist.
[17] Margaret Oliphant (1828–1897), English novelist.
[18] Francis Marion Crawford (1854–1909), English novelist.
[19] "The beautiful sky of Italy."
[20] "Tiresome sort."
[21] Guy de Maupassant (1850–1893), French writer.
[22] Zola (above, page 698). "The man of genius never has spirit."
[23] In Molière's (1622–1673) play *Tartuffe.*

Cyril That is certainly a very grave qualification, but I must say that I think you are rather unfair in some of your strictures. I like *The Deemster,* and *The Daughter of Heth,* and *Le Disciple,* and *Mr. Isaacs,* and as for *Robert Elsemere,*[31] I am quite devoted to it. Not that I can look upon it as a serious work. As a statement of the problems that confront the earnest Christian it is ridiculous and antiquated. It is simply Arnold's *Literature and Dogma*[32] with the literature left out. It is as much behind the age as Paley's *Evidences,* or Colenso's[33] method of Biblical exegesis. Nor could anything be less impressive than the unfortunate hero gravely heralding a dawn that rose long ago, and so completely missing its true significance that he proposes to carry on the business of the old firm under the new name. On the other hand, it contains several clever caricatures, and a heap of delightful quotations, and Green's philosophy very plentifully sugars the somewhat bitter pill of the author's fiction. I also cannot help expressing my surprise that you have said nothing about the two novelists whom you are always reading, Balzac and George Meredith.[34] Surely they are realists, both of them?

Vivian Ah! Meredith! Who can define him? His style is chaos illumined by flashes of lightning. As a writer he has mastered everything except language: as a novelist he can do everything, except tell a story: as an artist he is everything, except articulate. Somebody in Shakespeare—Touchstone, I think—talks about a man who is always breaking his shins over his own wit, and it seems to me that this might serve as a basis for a criticism of Meredith's method. But whatever he is, he is not a realist. Or, rather, I would say that he is a child of realism who is not on speaking terms with his father. By deliberate choice he has made himself a romanticist. He has refused to bow the knee to Baal, and after all, even if the man's fine spirit did not revolt against the noisy assertions of realism, his style would be quite sufficient of itself to keep life at a respectful distance. By its means he has planted round his garden a hedge full of thorns, and red with wonderful roses. As for Balzac, he was a most remarkable combination of the artistic temperament with the scientific spirit. The latter he bequeathed to his disciples: the former was entirely his own. The difference between such a book as M. Zola's[35] *L'Assommoir* and Balzac's *Illusions Perdues* is the difference between unimaginative realism and imaginative reality. "All Balzac's characters," said Baudelaire, "are gifted with the same ardor of life that animated himself. All his fictions are as deeply colored as dreams. Each mind is a weapon loaded to the muzzle with will. The very scullions have genius."[36] A steady course of Balzac reduces our living friends to shadows, and our acquaintances to the shadows of shades. His characters have a kind of fervent fiery-colored existence. They dominate us, and defy skepticism. One of the greatest tragedies of my life is the death of Lucien de Rubempré. It is a grief from which I have never been able to completely rid myself. It haunts me in my moments of pleasure. I remember it when I laugh. But Balzac is no more a realist than Holbein[37] was. He created life, he did not copy it. I admit, however, that he set far too high a value on modernity of form, and that, consequently, there is no book of his that, as an artistic masterpiece, can rank with *Salammbô* or *Esmond,* or *The Cloister and the Hearth,* or the *Vicomte de Bragelonne.*[38]

---

[24] John Ruskin (1819–1900), English literary and art critic.

[25] George Eliot (Mary Ann Evans, 1819–1880), English novelist.

[26] Alphonse Daudet (1840–1897), French novelist.

[27] "One must struggle for art."

[28] "Cruel words."

[29] *Twenty Years of My Literary Life.*

[30] Paul Bourget (1852–1935), French novelist; "psychological novel."

[31] *The Deemster* by Caine; *The Daughter of Heth* by Black; *Le Disciple* by Bourget; *Mr. Isaacs* by Crawford.

[32] Arnold (above, page 586).

[33] William Paley (1743–1805), English theologian; John William Colenso (d. 1883), Bishop of Natal, criticized by Arnold (above, page 595).

[34] T. H. Green (1836–1882), English philosopher and disciple of Coleridge; Honoré de Balzac (1799–1850), French novelist; George Meredith (1828–1909), English novelist.

Cyril Do you object to modernity of form, then?

Vivian Yes. It is a huge price to pay for a very poor result. Pure modernity of form is always somewhat vulgarizing. It cannot help being so. The public imagine that, because they are interested in their immediate surroundings, art should be interested in them also, and should take them as her subject matter. But the mere fact that they are interested in these things makes them unsuitable subjects for art. The only beautiful things, as somebody once said, are the things that do not concern us. As long as a thing is useful or necessary to us, or affects us in any way, either for pain or for pleasure, or appeals strongly to our sympathies, or is a vital part of the environment in which we live, it is outside the proper sphere of art.[39] To art's subject matter we should be more or less indifferent. We should, at any rate, have no preferences, no prejudices, no partisan feelings of any kind. It is exactly because Hecuba is nothing to us that her sorrows are such an admirable motive for tragedy. I do not know anything in the whole history of literature sadder than the artistic career of Charles Reade. He wrote one beautiful book. *The Cloister and the Hearth,* a book as much above *Romola* as *Romola* is above *Daniel Deronda,*[40] and wasted the rest of his life in a foolish attempt to be modern, to draw public attention to the state of our convict prisons, and the management of our private lunatic asylums. Charles Dickens was depressing enough in all conscience when he tried to arouse our sympathy for the victims of the poor-law administration; but Charles Reade, an artist, a scholar, a man with a true sense of beauty, raging and roaring over the abuses of contemporary life like a common pampheteer or a sensational journalist, is really a sight for the angels to weep over. Believe me, my dear Cyril, modernity of form and modernity of subject matter are entirely and absolutely wrong. We have mistaken the common livery of the age for the vesture of the Muses, and spend our days in the sordid streets and hideous suburbs of our vile cities when we should be out on the hillside with Apollo. Certainly we are a degraded race, and have sold our birthright for a mess of facts.

Cyril There is something in what you say, and there is no doubt that whatever amusement we may find in reading a purely modern novel, we have rarely any artistic pleasure in rereading it. And this is perhaps the best rough test of what is literature and what is not. If one cannot enjoy reading a book over and over again, there is no use reading it at all. But what do you say about the return to life and nature? This is the panacea that is always being recommended to us.

Vivian I will read you what I say on that subject. The passage comes later on in the article, but I may as well give it to you now: "The popular cry of our time is 'Let us return to life and nature; they will recreate art for us, and send the red blood coursing through her veins; they will show her feet with swiftness and make her hand strong.' But, alas! we are mistaken in our amiable and well-meaning efforts. Nature is always behind the age. And as for life, she is the solvent that breaks up art, the enemy that lays waste her house."

Cyril What do you mean by saying that nature is always behind the age?

Vivian Well, perhaps that is rather cryptic. What I mean is this. If we take nature to mean natural simple instinct as opposed to self-conscious culture, the work produced under this influence is always old-fashioned, antiquated, and out of date. One touch of nature may make the whole world kin, but two touches of nature will destroy any work of art. If, on the other hand, we regard nature as the collection of phenomena external to man, people only discover in her what they bring to her. She has no suggestions of her own. Wordsworth[41] went to the lakes, but he was never a lake poet. He found in stones the sermons he had already hidden there. He went moralizing about the district, but his good work was produced when he returned, not to nature but to poetry. Poetry gave him *Laodamia,* and the fine sonnets, and the great ode, such as it is. Nature gave him *Martha Ray* and *Peter Bell,* and the address to Mr. Wilkinson's spade.

[35] Zola (above, page 698).

[36] Baudelaire (above, page 604). From his essay *Theophile Gautier.*

[37] Rubempré: character in Balzac's *A Harlot's Progress*; Hans Holbein (1460–1524), German painter.

[38] *Salammbô* by Flaubert; *Henry Esmond* by William Makepeace Thackeray (1811–1863), English novelist; *The Cloister and the Hearth* by Charles Reade (1814–1884), English novelist; *Vicomte de Bragelonne* by Alexandre Dumas (1807–1870), French novelist.

[39] Here Wilde goes beyond Kant to limit art objects to uselessness in contrast to Kant's view that an object viewed aesthetically must not be considered with respect to its use.

[40] Both by George Eliot.

Cyril I think that view might be questioned. I am rather inclined to believe in the "impulse from a vernal wood,"[42] though, of course, the artistic value of such an impulse depends entirely on the kind of temperament that receives it, so that the return to nature would come to mean simply the advance to a great personality. You would agree with that, I fancy. However, proceed with your article.

Vivian (*Reading.*) "Art begins with abstract decoration, with purely imaginative and pleasurable work dealing with what is unreal and nonexistent. This is the first stage. Then life becomes fascinated with this new wonder, and asks to be admitted into the charmed circle. Art takes life as part of her rough material, recreates it, and refashions it in fresh forms, is absolutely indifferent to fact, invents, imagines, dreams, and keeps between herself and reality the impenetrable barrier of beautiful style, of decorative or ideal treatment. The third stage is when life gets the upper hand, and drives art out into the wilderness. This is the true decadence, and it is from this that we are now suffering.

"Take the case of the English drama. At first in the hands of the monks dramatic art was abstract, decorative, and mythological. Then she enlisted life in her service, and using some of life's external forms, she created an entirely new race of beings, whose sorrows were more terrible than any sorrow man has ever felt, whose joys were keener than lover's joys, who had the rage of the Titans and the calm of the gods, who had monstrous and marvelous sins, monstrous and marvelous virtues. To them she gave a language different from that of actual use, a language full of resonant music and sweet rhythm, made stately by solemn cadence, or made delicate by fanciful rhyme, jeweled with wonderful words, and enriched with lofty diction. She clothed her children in strange raiment and gave them masks, and at her bidding the antique world rose from its marble tomb. A new Caesar stalked through the streets of risen Rome, and with purple sail and flute-led oars another Cleopatra passed up the river to Antioch. Old myth and legend and dream took shape and substance. History was entirely rewritten, and there was hardly one of the dramatists who did not recognize that the object of art is not simple truth but complex beauty. In this they were perfectly right. Art itself is really a form of exaggeration; and selection, which is the very spirit of art, is nothing more than an intensified mode of overemphasis.

"But life soon shattered the perfection of the form. Even in Shakespeare we can see the beginning of the end. It shows itself by the gradual breaking up of the blank verse in the later plays, by the predominance given to prose, and by the overimportance assigned to characterization. The passages in Shakespeare—and they are many—where the language is uncouth, vulgar, exaggerated, fantastic, obscene even, are entirely due to life calling for an echo of her own voice, and rejecting the intervention of beautiful style, through which alone should life be suffered to find expression. Shakespeare is not by any means a flawless artist. He is too fond of going directly to life, and borrowing life's natural utterance. He forgets that when art surrenders her imaginative medium she surrenders everything. Goethe says, somewhere—*'In der Beschränkung zeigt sich erst der Meister.'* 'It is in working within limits that the master reveals himself'—and the limitation, the very condition of any art is style. However, we need not linger any longer over Shakespeare's realism. *The Tempest* is the most perfect of palinodes. All that we desired to point out was, that the magnificent work of the Elizabethan and Jacobean artists contained within itself the seeds of its own dissolution, and that, if it drew some of its strength from using life as a rough material, it drew all its weakness from using life as an artistic method. As the inevitable result of this substitution of an imitative for a creative medium, this surrender of an imaginative form, we have the modern English melodrama. The characters in these plays talk on the stage exactly as they would talk off it; they have neither aspirations nor aspirates; they are taken directly from life and reproduce its vulgarity down to the smallest detail; they present the gait, manner, costume, and accent of real people; they would pass unnoticed in a third-class railway carriage. And yet how wearisome the plays are! They do not succeed in producing even that impression of reality at which they aim, and which is their only reason for existing. As a method, realism is a complete failure.

---

[41] Wordsworth (above, page 481).

[42] Wordsworth, *The Tables Turned.*

"What is true about the drama and the novel is no less true about those arts that we call the decorative arts. The whole history of these arts in Europe is the record of the struggle between Orientalism, with its frank rejection of imitation, its love of artistic convention, its dislike to the actual representation of any object in nature, and our own imitative spirit. Wherever the former has been paramount, as in Byzantium, Sicily, and Spain, by actual contact, or in the rest of Europe by the influence of the Crusades, we have had beautiful and imaginative work in which the visible things of life are transmuted into artistic conventions, and the things that life has not are invented and fashioned for her delight. But wherever we have returned to life and nature, our work has always become vulgar, common, and uninteresting. Modern tapestry, with its aerial effects, its elaborate perspective, its broad expanses of waste sky, its faithful and laborious realism, has no beauty whatsoever. The pictorial glass of Germany is absolutely detestable. We are beginning to weave possible carpets in England, but only because we have returned to the method and spirit of the East. Our rugs and carpets of twenty years ago, with their solemn depressing truths, their inane worship of nature, their sordid reproductions of visible objects, have become, even to the Philistine, a source of laughter. A cultured Mahomedan once remarked to us, 'You Christians are so occupied in misinterpreting the fourth commandment that you have never thought of making an artistic application of the second.' He was perfectly right, and the whole truth of the matter is this: the proper school to learn art in is not life but art."

And now let me read you a passage which seems to me to settle the question very completely: "It was not always thus. We need not say anything about the poets, for they, with the unfortunate exception of Mr. Wordsworth, have been really faithful to their high mission, and are universally recognized as being absolutely unreliable. But in the works of Herodotus,[43] who, in spite of the shallow and ungenerous attempts of modern sciolists to verify his history, may justly be called the Father of Lies; in the published speeches of Cicero and the biographies of Suetonius; in Tacitus at his best; in Pliny's *Natural History;* in Hanno's *Periplus;* in all the early chronicles; in the lives of the saints; in Froissart and Sir Thomas Malory; in the travels of Marco Polo; in Olaus Magnus, and Aldrovandus, and Conrad Lycosthenes, with his magnificent *Prodigiorum et Ostentorum Chronicon;* in the autobiography of Benvenuto Cellini; in the memoirs of Casanova; in Defoe's *History of the Plague;* in Boswell's *Life of Johnson;* in Napoleon's dispatches, and in the works of our own Carlyle, whose *French Revolution* is one of the most fascinating historical novels ever written, facts are either kept in their proper subordinate position, or else entirely excluded on the general ground of dullness.[44] Now, everything is changed. Facts are not merely finding a footing place in history, but they are usurping the domain of fancy, and have invaded the kingdom of romance. Their chilling touch is over everything. They are vulgarizing mankind. The crude commercialism of America, its materializing spirit, its indifference to the poetical side of things, and its lack of imagination and of high unattainable ideals, are entirely due to that country having adopted for its national hero a man, who, according to his own confession, was incapable of telling a lie, and it is not too much to say that the story of George Washington and the cherry tree has done more harm, and in a shorter space of time, than any other moral tale in the whole of literature."

Cyril My dear boy!

Vivian I assure you it is the case, and the amusing part of the whole thing is that the story of the cherry tree is an absolute myth. However, you must not think that I am too despondent about the artistic future either of America or of our own country. Listen to this: "That some change will take place before this century has drawn to its close we have no doubt whatsoever. Bored by the tedious and improving conversation of those who have neither the wit to exaggerate nor the genius to romance, tired of the intelligent person whose reminiscences are always based upon memory, whose statements are invariably limited by probability, and who is at any time liable to be corroborated by the merest Philistine who happens to be present, society sooner or later must return to its lost leader, the cultured and fascinating liar. Who he was who first, without ever having gone out to the rude chase, told the wondering cavemen at sunset how he had dragged the megatherium from the purple darkness of its jasper cave, or slain the mammoth in single combat and brought back its gilded tusks, we cannot tell, and not one of our modern anthropologists, for all their much-boasted science, has had the ordinary courage to tell us. Whatever was his name or race, he certainly was the true founder of social intercourse. For the aim of the liar is simply to charm, to delight, to give pleasure. He is the very basis of civilized society, and without him a dinner party, even at the mansions of the great, is as dull as a lecture at the Royal Society, or a debate at the Incorporated Authors, or one of Mr. Burnand's farcical comedies.[45]

---

[43] Herodotus (c. 484–c. 425 B.C.), Greek historian.

[44] Cicero (above, page 74); Suetonius (fl. 100), Roman historian; Tacitus (above, page 90); Pliny the Elder (23–79), Roman naturalist; Hanno (fifth century B.C.), Carthaginian navigator; Jean Froissart (c. 1337–1410), Flemisth chronicler; Sir Thomas Malory (fl. 1469), English author of *Morte d'Arthur;* Marco Polo (1254–1323), Venetian traveler in China; Olaus Magnus (1490–1557), Bishop of Uppsala; Aldrovandus (Ulisse Aldovandri, 1522–1607), Italian naturalist; Conrad Lycosthenes (1518–1561), German humanist; Giacomo Casanova (1725–1798), Italian writer; Daniel Defoe (1661?–1731), English writer; James Boswell (1740–1795), Scottish biographer of Johnson (above, page 357); Napoleon Bonaparte (1769–1821), French emperor; Thomas Carlyle (1795–1881), English writer.

"Nor will he be welcomed by society alone. Art, breaking from the prison-house of realism, will run to greet him, and will kiss his false, beautiful lips, knowing that he alone is in possession of the great secret of all her manifestations, the secret that truth is entirely and absolutely a matter of style; while life—poor, probable, uninteresting human life—tired of repeating herself for the benefit of Mr. Herbert Spencer,[46] scientific historians, and the compilers of statistics in general, will follow meekly after him, and try to reproduce, in her own simple and untutored way, some of the marvels of which he talks.

"No doubt there will always be critics who, like a certain writer in the *Saturday Review,* will gravely censure the teller of fairy tales for his defective knowledge of natural history, who will measure imaginative work by their own lack of any imaginative faculty, and will hold up their ink-stained hands in horror if some honest gentleman, who has never been farther than the yew trees of his own garden, pens a fascinating book of travels like Sir John Mandeville, or, like great Raleigh,[47] writes a whole history of the world, without knowing anything whatsoever about the past. To excuse themselves they will try and shelter under the shield of him who made Prospero the magician, and gave him Caliban and Ariel as his servants, who heard the Tritons blowing their horns round the coral reefs of the Enchanted Isle, and the fairies singing to each other in a wood near Athens, who led the phantom kings in dim procession across the misty Scottish heath, and hid Hecate in a cave with the weird sisters. They will call upon Shakespeare—they always do—and will quote that hackneyed passage about art holding the mirror up to nature, forgetting that this unfortunate aphorism is deliberately said by Hamlet in order to convince the bystanders of his absolute insanity in all art matters."

Cyril Ahem! Another cigarette, please.

Vivian My dear fellow, whatever you may say, it is merely a dramatic utterance, and no more represents Shakespeare's real views upon art than the speeches of Iago represent his real views upon morals. But let me get to the end of the passage: "Art finds her own perfection within, and not outside of, herself. She is not to be judged by any external standard of resemblance. She is a veil, rather than a mirror. She has flowers that no forests know of, birds that no woodland possesses. She makes and unmakes many worlds, and can draw the moon from heaven with a scarlet thread. Hers are the 'forms more real than living man,' and hers the great archetypes of which things that have existence are but unfinished copies. Nature has, in her eyes, no laws, no uniformity. She can work miracles at her will, and when she calls monsters from the deep they come. She can bid the almond tree blossom in winter, and send the snow upon the ripe cornfield. At her word the frost lays its silver finger on the burning mouth of June, and the winged lions creep out from the hollows of the Lydian hills. The dryads peer from the thicket as she passes by, and the brown fauns smile strangely at her when she comes near them. She has hawk-faced gods that worship her, and the centaurs gallop at her side."

Cyril I like that. I can see it. Is that the end?

Vivian No. There is one more passage, but it is purely practical. It simply suggests some methods by which we could revive this lost art of lying.

Cyril Well, before you read it to me, I should like to ask you a question. What do you mean by saying that life, "poor, probable, uninteresting human life," will try to reproduce the marvels of art? I can quite understand your objection to art being treated as a mirror. You think it would reduce genius to the position of a cracked looking glass. But you don't mean to say that you seriously believe that life imitates art, that life in fact is the mirror, and art the reality?

Vivian Certainly I do. Paradox though it may seem—and paradoxes are always dangerous things—it is nonetheless true that life imitates art far more than art imitates life. We have all seen in our own day in England how a certain curious and fascinating type of beauty, invented and emphasized by two imaginative painters, has so influenced life that whenever one goes to a private view or to an artistic salon one sees, here the mystic eyes of Rossetti's[48] dream, the long ivory throat, the strange square-cut jaw, the loosened shadowy hair that he so ardently loved, there the sweet maidenhood of *The Golden Stair,* the blossom-like mouth and weary loveliness of the *Laus Amoris,* the passion-pale face of Andromeda, the thin hands and lithe beauty of the Vivien in *Merlin's Dream.* And it has always been so. A great artist invents a type, and life tries to copy it, to reproduce it in a popular form, like an enterprising publisher.

---

[45] F. C. Burnand, nineteenth-century Cambridge dramatist, later editor of *Punch.*

[46] Herbert Spencer (1820–1903), English philosopher.

[47] Mandeville (fl. fourteenth century), *The Voyage of Sir John Mandeville, Knight* (c. 1357); Sir Walter Raleigh, also spelled Ralegh (1554?–1618), *The History of the World* (1614).

[48] Dante Gabriel Rossetti (1828–1882), English poet and painter.

Neither Holbein nor Van Dyck[49] found in England what they have given us. They brought their types with them, and life with her keen imitative faculty set herself to supply the master with models. The Greeks, with their quick artistic instinct, understood this, and set in the bride's chamber the statue of Hermes or of Apollo, that she might bear children as lovely as the works of art that she looked at in her rapture or her pain. They knew that life gains from art not merely spirituality, depth of thought and feeling, soul-turmoil or soul-peace, but that she can form herself on the very lines and colors of art, and can reproduce the dignity of Phidias as well as the grace of Praxiteles.[50] Hence came their objection to realism. They disliked it on purely social grounds. They felt that it inevitably makes people ugly, and they were perfectly right. We try to improve the conditions of the race by means of good air, free sunlight, wholesome water, and hideous bare buildings for the better housing of the lower orders. But these things merely produce health, they do not produce beauty. For this, art is required, and the true disciples of the great artist are not his studio imitators, but those who become like his works of art, be they plastic as in Greek days, or pictorial as in modern times; in a word, life is art's best, art's only pupil.

As it is with the visible arts, so it is with literature. The most obvious and the vulgarest form in which this is shown is in the case of the silly boys who, after reading the adventures of Jack Sheppard or Dick Turpin,[51] pillage the stalls of unfortunate apple-women, break into sweetshops at night, and alarm old gentlemen who are returning home from the city by leaping out on them in suburban lanes, with black masks and unloaded revolvers. This interesting phenomenon, which always occurs after the appearance of a new edition of either of the books I have alluded to, is usually attributed to the influence of literature on the imagination. But this is a mistake. The imagination is essentially creative and always seeks for a new form. The boy burglar is simply the inevitable result of life's imitative instinct. He is fact, occupied as fact usually is, with trying to reproduce fiction, and what we see in him is repeated on an extended scale throughout the whole of life. Schopenhauer[52] has analyzed the pessimism that characterizes modern thought, but Hamlet invented it. The world has become sad because a puppet was once melancholy. The nihilist, that strange martyr who has no faith, who goes to the stake without enthusiasm, and dies for what he does not believe in, is a purely literary product. He was invented by Turgenev, and completed by Dostoevski.[53] Robespierre came out of the pages of Rousseau[54] as surely as the People's Palace rose out of the debris of a novel. Literature always anticipates life. It does not copy it, but molds it to its purpose. The nineteenth century, as we know it, is largely an invention of Balzac. Our Luciens de Rubempré, our Rastignacs, and de Marsays made their first appearance on the stage of the *Comédie Humaine.* We are merely carrying out, with footnotes and unnecessary additions, the whim or fancy or creative vision of a great novelist. I once asked a lady, who knew Thackeray intimately, whether he had had any model for Becky Sharp.[55] She told me that Becky was an invention, but that the idea of the character had been partly suggested by a governess who lived in the neighborhood of Kensington Square, and was the companion of a very selfish and rich old woman. I inquired what became of the governess, and she replied, that, oddly enough, some years after the appearance of *Vanity Fair,* she ran away with the nephew of the lady with whom she was living, and for a short time made a great splash in society, quite in Mrs. Rawdon Crawley's[56] style, and entirely by Mrs. Rawdon Crawley's methods. Ultimately she came to grief, disappeared to the Continent, and used to be occasionally seen at Monte Carlo and other gambling places. The noble gentleman from whom the same great sentimentalist drew Colonel Newcome died, a few months after *The Newcomes* had reached a fourth edition, with the word *Adsum* on his lips. Shortly after Mr. Stevenson published his curious psychological story of transformation,[57] a friend of mine, called Mr. Hyde, was in the north of London, and being anxious to get to a railway station, took what he thought would be a short cut, lost his way, and found himself in a network of mean, evil-looking streets. Feeling rather nervous, he began to walk extremely fast, when suddenly out of an archway ran a child right between his legs. It fell on the pavement, he tripped over it, and trampled upon it. Being of course very much frightened and a little hurt, it began to scream, and in a few seconds the whole street was full of rough people who came pouring out of the houses like ants. They surrounded him and asked him his name. He was just about to give it when he suddenly remembered the opening incident in Mr. Stevenson's story. He was so filled with horror at having realized in his own person that terrible and well-written scene, and at having done accidentally, though in fact, what the Mr. Hyde of fiction had done with deliberate intent, that he ran away as hard as he could go. He was, however, very closely followed, and finally he took refuge in a surgery, the door of which happened to be open, where he explained to a young assistant, who happened to be there, exactly what had occurred. The humanitarian crowd were induced to go away on his giving them a small sum of money, and as soon as the coast was clear he left. As he passed out, the name on the brass doorplate of the surgery caught his eye. It was Jekyll. At least it should have been.

---

[49] Anthony Van Dyke (1599–1645), Flemish painter.

[50] Phidias (c. 500–c.432 B.C.) and Praxiteles (c. 370–c. 340 B.C.), both Greek sculptors.

[51] Jack Sheppard (1702–1724) and Dick Turpin (1706–1739), both English criminals.

[52] Arnold Schopenhauer (1788–1860), German philosopher.

[53] Ivan Sergeyevich Turgenev (1818–1883) and Fyodor Mikhailovich Dostoevski (1821–1881), both Russian novelists.

[54] Maximilian Robespierre (1758–1794), French revolutionary; Jean Jacques Rousseau (1712–1778), French philosopher.

[55] Becky Sharp, main character of Thackeray's *Vanity Fair.*

[56] Becky Sharp's married name.

[57] *Dr. Jekyll and Mr. Hyde.*

Here the imitation, as far as it went, was of course accidental. In the following case the imitation was self-conscious: In the year 1879, just after I had left Oxford, I met at a reception at the house of one of the foreign ministers a woman of very curious exotic beauty. We became great friends, and were constantly together. And yet what interested me most in her was not her beauty, but her character, her entire vagueness of character. She seemed to have no personality at all, but simply the possibility of many types. Sometimes she would give herself up entirely to art, turn her drawing room into a studio, and spend two or three days a week at picture galleries or museums. Then she would take to attending race meetings, wear the most horsey clothes, and talk about nothing but betting. She abandoned religion for mesmerism, mesmerism for politics, and politics for the melodramatic excitements of philanthropy. In fact, she was a kind of Proteus, and as much a failure in all her transformations as was that wondrous sea god when Odysseus laid hold of him. One day a serial began in one of the French magazines. At that time I used to read serial stories, and I well remember the shock of surprise I felt when I came to the description of the heroine. She was so like my friend that I brought her the magazine, and she recognized herself in it immediately, and seemed fascinated by the resemblance. I should tell you, by the way, that the story was translated from some dead Russian writer, so that the author had not taken his type from my friend. Well, to put the matter briefly, some months afterwards I was in Venice, and finding the magazine in the reading room of the hotel, I took it up casually to see what had become of the heroine. It was a most piteous tale, as the girl had ended by running away with a man absolutely inferior to her, not merely in social station, but in character and intellect also. I wrote to my friend that evening about my views on John Bellini, and the admirable ices at Florio's, and the artistic value of gondolas, but added a postscript to the effect that her double in the story had behaved in a very silly manner. I don't know why I added that, but I remember I had a sort of dread over me that she might do the same thing. Before my letter had reached her, she had run away with a man who deserted her in six months. I saw her in 1884 in Paris, where she was living with her mother, and I asked her whether the story had had anything to do with her action. She told me that she had felt an absolutely irresistible impulse to follow the heroine step by step in her strange and fatal progress, and that it was with a feeling of real terror that she had looked forward to the last few chapters of the story. When they appeared, it seemed to her that she was compelled to reproduce them in life, and she did so. It was a most clear example of this imitative instinct of which I was speaking, and an extremely tragic one.

However, I do not wish to dwell any further upon individual instances. Personal experience is a most vicious and limited circle. All that I desire to point out is the general principle that life imitates art far more than art imitates life, and I feel sure that if you think seriously about it you will find that it is true. Life holds the mirror up to art, and either reproduces some strange type imagined by painter or sculptor, or realizes in fact what has been dreamed in fiction. Scientifically speaking, the basis of life—the energy of life, as Aristotle would call it[58]—is simply the desire for expression, and art is always presenting various forms through which this expression can be attained. Life seizes on them and uses them, even if they be to her own hurt. Young men have committed suicide because Rolla did so, have died by their own hand because by his own hand Werther died. Think of what we owe to the imitation of Christ, of what we owe to the imitation of Caesar.

Cyril The theory is certainly a very curious one, but to make it complete you must show that nature, no less than life, is an imitation of art. Are you prepared to prove that?

Vivian My dear fellow, I am prepared to prove anything.

Cyril Nature follows the landscape painter then, and takes her effects from him?

Vivian Certainly. Where, if not from the Impressionists, do we get those wonderful brown fogs that come creeping down our streets, blurring the gas lamps and changing the houses into monstrous shadows? To whom, if not to them and their master, do we owe the lovely silver mists that brood over our river, and turn to faint forms of fading grace, curved bridge and swaying barge? The extraordinary change that has taken place in the climate of London during the last ten years is entirely due to this particular school of art. You smile. Consider the matter from a scientific or a metaphysical point of view, and you will find that I am right. For what is nature? Nature is no great mother who has borne us. She is our creation. It is in our brain that she quickens to life. Things are because we see them, and what we see, and how we see it, depends on the arts that have influenced us. To look at a thing is very different from seeing a thing. One does not see anything until one sees its beauty. Then, and then only, does it come into existence. At present, people see fogs, not because there are fogs, but because poets and painters have taught them the mysterious loveliness of such effects. There may have been fogs for centuries in London. I dare say there were. But no one saw them, and so we do not know anything about them. They did not exist till art had invented them. Now, it must be admitted, fogs are carried to excess. They have become the mere mannerism of a clique, and the exaggerated realism of their method gives dull people bronchitis. Where the cultured catch an effect, the uncultured catch cold. And so, let us be humane, and invite art to turn her wonderful eyes elsewhere. She has done so already, indeed. That white quivering sunlight that one sees now in France, with its strange blotches of mauve, and its restless violet shadows, is her latest fancy, and, on the whole, nature reproduces it quite admirably. Where she used to give us Corots and Daubignys, she gives us now exquisite Monets and entrancing Pisarros.[59] Indeed, there are moments, rare, it is true, but still to be observed from time to time, when nature becomes absolutely modern. Of course she is not always to be relied upon. The fact is that she is in this unfortunate position: art creates an incomparable and unique effect, and, having done so, passes on to other things. Nature, upon the other hand, forgetting that imitation can be made the sincerest form of insult, keeps on repeating this effect until we all become absolutely wearied of it. Nobody of any real culture, for instance, ever talks nowadays about the beauty of a sunset. Sunsets are quite old-fashioned. They belong to the time when Turner[60] was the last note in art. To admire them is a distinct sign of provincialism of temperament. Upon the other hand they go on. Yesterday evening Mrs. Arundel insisted on my going to the window, and looking at the glorious sky, as she called it. Of course I had to look at it. She is one of those absurdly pretty Philistines, to whom one can deny nothing. And what was it? It was simply a very second-rate Turner, a Turner of a bad period, with all the painter's worst faults exaggerated and overemphasized. Of course, I am quite ready to admit that life very often commits the same error. She produces her false Renés and her sham Vautrins, just as nature gives us, on one day a doubtful Cuyp, and on another a more than questionable Rousseau. Still, nature irritates one more when she does things of that kind. It seems so stupid, so obvious, so unnecessary. A false Vautrin might be delightful. A doubtful Cuyp is unbearable. However, I don't want to be too hard on nature. I wish the Channel, especially at Hastings, did not look quite so often like a Henry Moore,[61] gray pearl with yellow lights, but then, when art is more varied, nature will, no doubt, be more varied also. That she imitates art, I don't think even her worst enemy would deny now. It is the one thing that keeps her in touch with civilized man. But have I proved my theory to your satisfaction?

---

[58] "Energeia" in Aristotle, a rather free translation by Vivian.

Cyril You have proved it to my dissatisfaction, which is better. But even admitting this strange imitative instinct in life and nature, surely you would acknowledge that art expresses the temper of its age, the spirit of its time, the moral and social conditions that surround it, and under whose influence it is produced.

Vivian Certainly not! Art never expresses anything but itself. This is the principle of my new aesthetics; and it is this, more than that vital connection between form and substance, on which Mr. Pater dwells,[62] that makes music the type of all the arts. Of course, nations and individuals, with that healthy natural vanity which is the secret of existence, are always under the impression that it is of them that the Muses are talking, always trying to find in the calm dignity of imaginative art some mirror of their own turbid passions, always forgetting that the singer of life is not Apollo, but Marsyas.[63] Remote from reality, and with her eyes turned away from the shadows of the cave, art reveals her own perfection, and the wondering crowd that watches the opening of the marvelous, many-petaled rose fancies that it is its own history that is being told to it, its own spirit that is finding expression in a new form. But it is not so. The highest art rejects the burden of the human spirit, and gains more from a new medium or a fresh material than she does from any enthusiasm for art, or from any great awakening of the human consciousness. She develops purely on her own lines. She is not symbolic of any age. It is the ages that are her symbols.

---

[59] Claude Monet (1840–1926), Charles Francois Daubigny (1817–1878), Camille Pissarro (1830–1903), all French painters.

[60] Joseph Mallord William Turner (1775–1851), English painter.

[61] Henry Moore (1831–1895), English painter.

[62] Pater (above, page 617): "All art aspires to the condition of music. For while in all other kinds of art it is possible to distinguish the matter from the form, and the understanding can always make this distinction, yet it is the constant effort of art to obliterate it." *Studies in the History of the Renaissance.*

[63] A mythological figure connected with Greek music. He challenged Apollo to a musical contest, lost, and was punished for his presumption.

Even those who hold that art is representative of time and place and people, cannot help admitting that the more imitative an art is, the less it represents to us the spirit of its age. The evil faces of the Roman emperors look out at us from the foul porphyry and spotted jasper in which the realistic artists of the day delighted to work, and we fancy that in those cruel lips and heavy sensual jaws we can find the secret of the ruin of the empire. But it was not so. The vices of Tiberius[64] could not destroy that supreme civilization, any more than the virtues of the Antonines[65] could save it. It fell for other, for less interesting reasons. The sibyls and prophets of the Sistine may indeed serve to interpret for some that new birth of the emancipated spirit that we call the Renaissance; but what do the drunken boots and crawling peasants of Dutch art tell us about the great soul of Holland? The more abstract, the more ideal an art is, the more it reveals to us the temper of its age. If we wish to understand a nation by means of its art, let us look at its architecture or its music.

Cyril I quite agree with you there. The spirit of an age may be best expressed in the abstract ideal arts, for the spirit itself is abstract and ideal. Upon the other hand, for the visible aspect of an age, for its look, as the phrase goes, we must, of course, go to the arts of imitation.

Vivian I don't think so. After all, what the imitative arts really give us are merely the various styles of particular artists, or of certain schools of artists. Surely you don't imagine that the people of the Middle Ages bore any resemblance at all to the figures on medieval stained glass, or in medieval stone and wood carving, or on medieval metalwork, or tapestries, or illuminated manuscripts. They were probably very ordinary-looking people, with nothing grotesque, or remarkable, or fantastic in their appearance. The Middle Ages, as we know them in art, are simply a definite form of style, and there is no reason at all why an artist with this style should not be produced in the nineteenth century. No great artist ever sees things as they really are. If he did, he would cease to be an artist. Take an example from our own day. I know that you are fond of Japanese things. Now, do you really imagine that the Japanese people, as they are presented to us in art, have any existence? If you do, you have never understood Japanese art at all. The Japanese people are the deliberate self-conscious creation of certain individual artists. If you set a picture by Hokusai, or Hokkei,[66] or any of the great native painters, beside a real Japanese gentleman or lady, you will see that there is not the slightest resemblance between them. The actual people who live in Japan are not unlike the general run of English people; that is to say, they are extremely commonplace, and have nothing curious or extraordinary about them. In fact the whole of Japan is a pure invention. There is no such country, there are no such people. One of our most charming painters went recently to the Land of the Chrysanthemum in the foolish hope of seeing the Japanese. All he saw, all he had the chance of painting, were a few lanterns and some fans. He was quite unable to discover the inhabitants, as his delightful exhibition at Messrs. Dowdeswell's Gallery showed only too well. He did not know that the Japanese people are, as I have said, simply a mode of style, an exquisite fancy of art. And so, if you desire to see a Japanese effect, you will not behave like a tourist and go to Tokyo. On the contrary, you will stay at home, and steep yourself in the work of certain Japanese artists, and then, when you have absorbed the spirit of their style, and caught their imaginative manner of vision, you will go some afternoon and sit in the park or stroll down Piccadilly, and if you cannot see an absolutely Japanese effect there, you will not see it anywhere. Or, to return again to the past, take as another instance the ancient Greeks. Do you think that Greek art ever tells us what the Greek people were like? Do you believe that the Athenian women were like the stately dignified figures of the Parthenon frieze, or like those marvelous goddesses who sat in the triangular pediments of the same building? If you judge from the art, they certainly were so. But read an authority, like Aristophanes,[67] for instance. You will find that the Athenian ladies laced tightly, wore high-heeled shoes, dyed their hair yellow, painted and rouged their faces, and were exactly like any silly fashionable or fallen creature of our own day. The fact is that we look back on the ages entirely through the medium of art, and art, very fortunately, has never once told us the truth.

Cyril But modern portraits by English painters, what of them? Surely they are like the people they pretend to represent?

Vivian Quite so. They are so like them that a hundred years from now no one will believe in them. The only portraits in which one believes are portraits where there is very little of the sitter and a very great deal of the artist. Holbein's drawings of the men and women of his time impress us with a sense of their absolute reality. But this is simply because Holbein compelled life to accept his conditions, to restrain itself within his limitations, to reproduce his type, and to appear as he wished it to appear. It is style that makes us believe in a thing—nothing but style. Most of our modern portrait painters are doomed to absolute oblivion. They never paint what they see. They paint what the public sees, and the public never sees anything.

---

[64] Tiberius (942 B.C.–37 A.D.), Roman emperor (14–37).

[65] Antonines, seven Roman emperors of the second century.

[66] Hokusai (1766–1849) and Hokkei (1780–1850), Japanese artists.

[67] Aristophanes (450–388 B.C.), Greek comic dramatist.

Cyril Well, after that, I think I should like to hear the end of your article.

Vivian With pleasure. Whether it will do any good, I really cannot say. Ours is certainly the dullest and most prosaic century possible. Why, even sleep has played us false, and has closed up the gates of ivory, and opened the gates of horn.[68] The dreams of the great middle classes of the country, as recorded in Mr. Myers's[69] two bulky volumes on the subject, and in the *Transactions of the Psychical Society,* are the most depressing things that I have ever read. There is not even a fine nightmare among them. They are commonplace, sordid, and tedious. As for the church, I cannot conceive anything better for the culture of a country than the presence in it of a body of men whose duty it is to believe in the supernatural, to perform daily miracles, and to keep alive that mythopoeic faculty which is so essential for the imagination. But in the English church a man succeeds, not through his capacity for belief, but through his capacity for disbelief. Ours is the only church where the skeptic stands at the altar, and where St. Thomas is regarded as the ideal apostle. Many a worthy clergyman, who passes his life in admirable works of kindly charity, lives and dies unnoticed and unknown; but it is sufficient for some shallow, uneducated passman out of either university to get up in his pulpit and express his doubts about Noah's ark, or Balaam's ass, or Jonah and the whale, for half of London to flock to hear him, and to sit openmouthed in rapt admiration at his superb intellect. The growth of common sense in the English church is a thing very much to be regretted. It is really a degrading concession to a low form of realism. It is silly, too. It springs from an entire ignorance of psychology. Man can believe the impossible, but man can never believe the improbable. However, I must read the end of my article: "What we have to do, what at any rate it is our duty to do, is to revive this old art of lying. Much, of course, may be done, in the way of educating the public, by amateurs in the domestic circle, at literary lunches, and at afternoon teas. But this is merely the light and graceful side of lying, such as was probably heard at Cretan dinner parties. There are many other forms. Lying for the sake of gaining some immediate personal advantage, for instance—lying with a moral purpose, as it is usually called—though of late it has been rather looked down upon, was extremely popular with the antique world. Athena laughs when Odysseus tells her 'his words of sly devising,' as Mr. William Morris phrases it, and the glory of mendacity illumines the pale brow of the stainless hero of Euripidean[70] tragedy, and sets among the noble women of the past the young bride of one of Horace's[71] most exquisite odes. Later on, what at first had been merely a natural instinct was elevated into a self-conscious science. Elaborate rules were laid down for the guidance of mankind, and an important school of literature grew up round the subject. Indeed, when one remembers the excellent philosophical treatise of Sanchez[72] on the whole question, one cannot help regretting that no one has ever thought of publishing a cheap and condensed edition of the works of that great casuist. A short primer, *When to Lie and How,* if brought out in an attractive and not too expensive a form, would, no doubt, command a large sale, and would prove of real practical service to many earnest and deep-thinking people. Lying for the sake of the improvement of the young, which is the basis of home education, still lingers amongst us, and its advantages are so admirably set forth in the early books of Plato's *Republic*[73] that it is unnecessary to dwell upon them here. It is a mode of lying for which all good mothers have peculiar capabilities, but it is capable of still further development, and has been sadly overlooked by the school board. Lying for the sake of a monthly salary is, of course, well known in Fleet Street, and the profession of a political leader-writer is not without its advantages. But it is said to be a somewhat dull occupation, and it certainly does not lead to much beyond a kind of ostentatious obscurity. The only form of lying that is absolutely beyond reproach is lying for its own sake, and the highest development of this is, as we have already pointed out, lying in art. Just as those who do not love Plato more than truth cannot pass beyond the threshold of the academe, so those who do not love beauty more than truth never know the inmost shrine of art. The solid, stolid British intellect lies in the desert sands like the sphinx in Flaubert's marvelous tale, and fantasy, *La Chimère,* dances round it, and calls to it with her false, flute-toned voice. It may not hear her now, but surely some day, when we are all bored to death with the commonplace character of modern fiction, it will hearken to her and try to borrow her wings.

"And when that day dawns, or sunset reddens, how joyous we shall all be! Facts will be regarded as discreditable, truth will be found mourning over her fetters, and romance, with her temper of wonder, will return to the land. The very aspect of the world will change to our startled eyes. Out of the sea will rise Behemoth and Leviathan, and sail round the high-pooped galleys, as they do on the delightful maps of those ages when books on geography were actually readable. Dragons will wander about the waste places, and the phoenix will soar from her nest of fire into the air. We shall lay our hands upon the basilisk, and see the jewel in the toad's head. Champing his gilded oats, the hippogriff will stand in our stalls, and over our heads will float the bluebird, singing of beautiful and impossible things, of things that are lovely and that never happen, of things that are not and that should be. But before this comes to pass, we must cultivate the lost art of lying."

---

[68] In Greek mythology the gate of horn and the ivory gate are the gates through which dreams come forth from the realm of sleep. Dreams passing through the gate of horn are true.

[69] Frederick William Henry Myers (1843–1901), English essayist and poet.

[70] Euripides (c. 480–c. 406 B.C.), Greek tragic dramatist.

[71] Horace (above, page 78).

[72] Francisco Sanchez (c. 1550–c. 1623), Spanish philosopher.

[73] Vivian refers ironically to Plato's branding of poets as liars in *Republic* (above, page 19).

Cyril Then we must certainly cultivate it at once. But in order to avoid making any error, I want you to tell me briefly the doctrines of the new aesthetics.

Vivian Briefly, then, they are these. Art never expresses anything but itself. It has an independent life, just as thought has, and develops purely on its own lines. It is not necessarily realistic in an age of realism, nor spiritual in an age of faith. So far from being the creation of its time, it is usually in direct opposition to it, and the only history that it preserves for us is the history of its own progress. Sometimes it returns upon its footsteps, and revives some antique form, as happened in the archaistic movement of late Greek art, and in the pre-Raphaelite movement of our own day. At other times it entirely anticipates its age, and produces in one century work that it takes another century to understand, to appreciate, and to enjoy. In no case does it reproduce its age. To pass from the art of a time to the time itself is the great mistake that all historians commit.

The second doctrine is this. All bad art comes from returning to life and nature, and elevating them into ideals. Life and nature may sometimes be used as a part of art's rough material, but before they are of any real service to art they must be translated into artistic conventions. The moment art surrenders its imaginative medium it surrenders everything. As a method, realism is a complete failure, and the two things that every artist should avoid are modernity of form and modernity of subject matter. To us, who live in the nineteenth century, any century is a suitable subject for art except our own. The only beautiful things are the things that do not concern us. It is, to have the pleasure of quoting myself, exactly because Hecuba is nothing to us that her sorrows are so suitable a motive for a tragedy. Besides, it is only the modern that ever becomes old-fashioned. M. Zola sits down to give us a picture of the Second Empire. Who care for the Second Empire now? It is out of date. Life goes faster than realism, but romanticism is always in front of life.

The third doctrine is that life imitates art far more than art imitates life. This results not merely from life's imitative instinct, but from the fact that the self-conscious aim of life is to find expression, and that art offers it certain beautiful forms through which it may realize that energy. It is a theory that has never been put forward before, but it is extremely fruitful, and throws an entirely new light upon the history of art.

It follows, as a corollary from this, that external natures also imitates art. The only effects that she can show us are effects that we have already seen through poetry, or in paintings. This is the secret of nature's charm, as well as the explanation of nature's weakness.

The final revelation is that lying, the telling of beautiful untrue things, is the proper aim of art. But of this I think have spoken at sufficient length. And now let us go out on the terrace, where "droops the milk-white peacock like a ghost," while the evening star "washes the dusk with silver." At twilight nature becomes a wonderfully suggestive effect, and is not without loveliness, though perhaps its chief use is to illustrate quotations from the poets. Come! We have talked long enough.

Stéphane Mallarmé

1842–1898

"It will be said, I suppose, that I am attempting to flabbergast the mob with a lofty statement. This is true." Mallarmé's remark, tinged with irony, is replete with scorn. He has been accused of preciosity, snobbishness, and obscurantism. There is something as elusive about his critical prose as about his poetry. Perhaps it is because he sees the poet as constantly testing the possibilities, indeed the limits, of language. He hates the newspaper; he loves the book. For him, poetry lies in "the *contemplation* of things, in the image emanating from the reveries which things arouse in us." Poetry does not *name,* it *suggests.* From the common point of view, therefore, that of the "mob," poetry is obscure, enigmatic, and indirect rather than direct in its treatment of things. It is not surprising that for Mallarmé the true sister art of poetry is music.

Stylistic hauteur is one way in which Mallarmé dramatizes his break with both Romantic expressivism and traditional didacticism. Nor is literature for him imitation. Reality is in the poem itself. It may "exist on a piece of paper": "All earthly existence must ultimately be contained in a book." The poet, then, is not expressing himself, teaching the reader, or copying nature, but rather searching out and capturing an elusive reality in words, perhaps *making* reality in words. Though Mallarmé sometimes suggests that the poet is trying, though always failing, to capture Platonic ideas, he also seems to say that the poem organizes reality for us by means of the obscurity of its own nondiscursive aspects. This view represents a characteristic of French symbolist theory that is a precursor of the idea of the independent nature of the poem in much early-twentieth-century criticism.

Mallarmé's complete works are available in French (1945). For an English translation of a selection of Mallarmé's critical writings see *Mallarmé: Selected Prose, Essays, and Letters,* translated by Bradford Cook (1956). See Hayse Cooperman, *The Aesthetics of Mallarmé* (1933); Guy Delfal, *L'Ésthetique de Stéphane Mallarmé* (1951), especially pages 161–84; Wallace Fowlie, *Mallarmé* (1953); Warren Ramsey, "A View of Mallarmé's Poetics," *Romantic Review* XLVI (1955), 178–91; Guy Michaud, *Mallarmé* (tr. 1965); Thomas A. Williams, *Mallarmé and the Language of Symbolism* (1970); Paula Gilbert Lewis, *The Aesthetic of Mallarmé in Relation to His Public* (1976); Judy Karvis, *The Prose of Mallarmé* (1976); Malcolm Bowie, *Mallarmé and the Art of Being Difficult* (1978); Louis Wirth Marvick, *Mallarmé and the Sublime* (1986); Gordon Millan, *A Throw of the Dice: The Life of Stéphane Mallarmé* (1994); Roger Pearson, *Unfolding Mallarmé* (1996); Robert Greer Cohn, ed., *Mallarmé in the Twentieth Century* (1998); Mary Ann Caws, ed., *Mallarmé in Prose* (2001).

The Evolution of Literature

"We are now witnessing a spectacle," he told me, "which is truly extraordinary, unique in the history of poetry: every poet is going off by himself with his own flute, and playing the songs he pleases. For the first time since the beginning of poetry, poets have stopped singing bass. Hitherto, as you know, if they wished to be accompanied, they had to be content with the great organ of official meter. Well, it was simply overplayed and they got tired of it! I am sure that when the great Hugo died,[1] he was convinced that he had buried all poetry for the next century; and yet Paul Verlaine[2] had already written *Sagesse*. We can forgive Hugo his illusion, when we remember all the miracles he produced; he was simply forgetting the eternal instinct, the perpetual and unavoidable growth of the lyrical. But the essential and undeniable point is this: that in a society without stability, without unity, there can be no stable or definitive art. From that incompletely organized society—which also explains the restlessness of certain minds—the unexplained need for individuality was born. The literary manifestations of today are a direct reflection of that need.

"A more immediate explanation of recent innovations is this: it has finally been understood that the old verse form was *not* the absolute, unique, and changeless form, but just one way to be sure of writing good verse. We say to children: 'Don't steal, and you'll be honest.' That is true, but it is not everything. Is it possible to write poetry without reference to time-honored precepts? Poets have answered this question affirmatively, and I believe that they are right. Poetry is everywhere in language, so long as there is rhythm—everywhere except on posters and the back page of the newspaper. In the genre we call *prose*, there are verses—sometimes admirable verses—of all sorts of rhythms. Actually, there is no such thing as prose: there is the alphabet, and then there are verses which are more or less closely knit, more or less diffuse. So long as there is stylistic effort, there is versification.

"I said a minute ago that today's poetry is, in the main, the result of the poets' boredom with official verse. Even the partisans of official verse share this boredom. Isn't it rather abnormal that, when we open a book of poetry, we should be sure of finding uniform and conventional rhythms throughout? And yet, all the while, the writer hopes to arouse our interest in the essential variety of human feelings! Where is the inspiration in all this! Where is the unforeseen! How tiresome it all is! Official verse must be used only in crisis moments of the soul. Modern poets have understood this. With a fine sense of the delicate and the sparing, they hover around the official Alexandrine,[3] approach it with unusual timidity, almost with fear; and rather than use it as their principle or as a point of departure, they suddenly conjure it up, and with it they crown their poem or period!

"Moreover, the same transformation has taken place in music. Instead of the very clearly delineated melodies of the past, we have an infinity of broken melodies which enrich the poetic texture, and we no longer have the impression of strong cadence."

"Is that how the scission was effected?" I asked.

"Why, yes. The Parnassians[4] were fond of a very formal prosody which has its own beauty, and they failed to realize that the modern poets were simply complementing their work; this also had the advantage of creating a sort of interregnum for the noble Alexandrine which had been at bay, crying for mercy. What we have to realize is that the most recent poetical writings do not tend to suppress the official verse; they tend rather to let a little more air into the poem, to create a kind of fluidity or mobility between long-winded verses, which has heretofore been lacking. In an orchestra, for example, you may suddenly hear very fine bursts of sound from the basses; but you know perfectly well that if there were nothing but that, you would soon have enough of it. Young poets space these bursts so that they will occur only when a total effect is to be produced. In this way, the Alexandrine (which was invented by nobody, but rather poured forth spontaneously from the instrument of language) will get out of its present finicky, sedentary state, and henceforth it will be freer, more sudden, more refreshed. Its value will lie exclusively in its use during the soul's most serious times. And future volumes of poetry will be traversed by a majestic first verse which scatters in its wake an infinity of motifs originating in the individual's sensibility.

"So there has been scission because both sides have been unaware that their points of view are reconcilable rather than mutually destructive. On the one hand, the

---

The Evolution of Literature is a report of an interview of Mallarmé by Jules Huret that appeared in *Echo de Paris* in 1891. *The Book: A Spiritual Instrument* was first published in *La Revue Blanche* in 1895. *Mystery in Literature* was first published in *La Revue Blanche* in 1896. The text of all three is from *Mallarmé: Selected Prose, Poems, and Letters* translated by Bradford Cook (Baltimore: The Johns Hopkins Press, 1956).

[1] Victor Marie Hugo (1802–1885), French writer.

[2] Paul Verlaine (1844–1896), French poet.

[3] Alexandrine: iambic hexameter, commonly used by neoclassical French poets.

[4] Parnassians: a group of post-Romantic, pre-symbolist nineteenth-century French poets, named for a mountain sacred to Apollo.

Parnassians have, in effect, been perfectly obedient servants of verse, and have sacrificed their personalities. The young poets, on the other hand, have anchored their instinct in a variety of modes, as if there were no precedent; actually, all they are doing is reducing here and there the stiffness of the Parnassian structures; and it seems to me that the two points of view are complementary.

"Despite all this, I still believe, personally, that, with the miraculous knowledge of verse and with the superb instinct for rhythmic pause which such masters as Banville[5] possess, the Alexandrine can be infinitely varied and can reproduce all possible shades of human passion. Banville's *Forgeron,* for example, has a number of Alexandrines which seem interminable, yet others which are unbelievably concise.

"But, after all, it was a good thing to give our perfect and traditional poetic instrument a little rest. It had been overworked."

"So much for form," I said. "What about content?"

"As far as content is concerned," he answered, "I feel that the young poets are nearer than the Parnassians to the poetical ideal. The latter still treat their subjects as the old philosophers and orators did: that is, they present things directly, whereas I think that they should be presented allusively. Poetry lies in the *contemplation* of things, in the image emanating from the reveries which things arouse in us. The Parnassians take something in its entirety and simply exhibit it; in so doing, they fall short of mystery; they fail to give our minds that exquisite joy which consists of believing that we are creating something. To *name* an object is largely to destroy poetic enjoyment, which comes from gradual divination. The ideal is to *suggest* the object. It is the perfect use of this mystery which constitutes symbol. An object must be gradually evoked in order to show a state of soul; or else, choose an object and from it elicit a state of soul by means of a series of decodings."

"Now," I said, "we are coming to the big objection I was going to make: obscurity!"

"Yes, it is a dangerous thing," he replied, "regardless of whether it results from the reader's inadequacy or from the poet's. But if you avoid the work it involves, you are cheating. If a person of mediocre intelligence and insufficient literary experience happens to open an obscure book and insists on enjoying it, something is wrong; there has simply been a misunderstanding. There must always be enigma in poetry. The purpose of literature—the *only* purpose—is to *evoke* things."

"Was it you, sir," I asked, "who created the new movement in poetry?"

"I detest 'schools,'" he replied, "and anything resembling schools. The professional attitude toward literature is repugnant to me. Literature is entirely an individual matter. As far as I am concerned, a poet today, in the midst of this society which refuses to let him live, is a man who seeks out solitude in order to sculpture his own tomb. The reason I appear to be the leader of a school, is, first of all, that I have always taken an interest in the ideas of young poets; and second, because of my sincerity in recognizing the originality of what the latest writers have contributed. In reality, I am a hermit. I believe that poetry should be for the supreme pomp and circumstance of a constituted society in which glory should have its place. Most people seem to have forgotten glory. In our time the poet can only go on strike against society; and turn his back on all the contaminated ways and means that are offered him. For anything that is offered him is necessarily inferior to his ideal and to his secret labor."

I then asked Mallarmé what Verlaine's position would be in the history of this poetic movement.

"He was the first to react against the impeccable and impassible Parnassian attitudes. His fluid verse and certain of his intentional dissonances were already evident in *Sagesse.* Later on, around 1875, all the Parnassians (except for a few friends such as Mendès, Dierx, and Cladel)[6] shrieked with horror at my *Afternoon of a Faun,* and, all together, they threw it out. For I *was* trying, actually, to make a sort of running pianistic commentary upon the fully preserved and dignified Alexandrine—a sort of musical accompaniment which the poet composes himself, so that the official verse will appear only on the really important occasions. But the father, the real father of all the young poets is Verlaine, the magnificent Verlaine. The attitude of the man is just as noble as the attitude of the writer. For it is the only possible attitude at a time when all poets are outlaws. Think of absorbing all the grief that he has—and with his pride and his tremendous pluck!"

"What do you think of the end of naturalism?"

"Up to now, writers have entertained the childish belief that if they could just choose a certain number of precious stones, for example, and put the names on paper, they would be *making* precious stones. Now, really! That is impossible, no matter how well it is done. Poetry consists of *creation:* we must delve into our souls for states and gleams of such perfect purity, so perfectly sung and illuminated, that they will truly be the jewels of man. When we do that, we have symbol, we have creation, and the word *poetry* has its full meaning. This, in short, is the only possible human creation.

---

[5] Theodore Faullain de Banville (1823–1891), French poet.

[6] Catulle Mendès (1841–1909), Leon Dierx (1838–1912), Leon Cladel (1838–1912), all French poets.

And if, in fact, the precious stones we wear do *not* show a state of soul, they are improperly worn. Take women, for example, external thieves that they are. . . .

"And just think," he added, chuckling, "the marvelous thing about jewelry stores is that, occasionally, we learn from the chief of police that what the woman wore improperly was something she didn't know the secret meaning of—something, therefore, which didn't belong to her.

"But to get back to naturalism. It seems to me that when we use that word, we mean the work of Émile Zola;[7] and when he has finished his work, the name will disappear. I have great admiration for Zola. Actually, what he does is not so much literature as evocative art. He depends as little as possible on literary means. True, he uses words, but that is all. Everything else is based on his marvelous sense of organization and has immediate repercussions in the mind of the mob. His talent is truly powerful; consider his tremendous feeling for life, his mob movements, that texture in Nana's skin that every one of us has touched; and he paints it all with prodigious colors. It really is an admirably organized piece of work. But literature is more of an intellectual thing than that. Things already exist, we don't have to create them; we simply have to see their relationships. It is the threads of those relationships which go to make up poetry and music."

"Are you acquainted with the psychological novel?"

"Slightly. After the great works of Flaubert, the Goncourt brothers,[8] and Zola—which are, in a sense, poems—novelists seem to be going back to the old eighteenth-century French taste which was much more humble and modest, consisting, as it did, not of a pictorial presentation of the outer form of things but rather of a dissection of the motives of the human soul. But there is the same difference between that and poetry as there is between a corset and a beautiful throat."

Before leaving, I asked Mallarmé for the names of those who seemed to him to represent the modern evolution in poetry.

"The young poets," he answered, "who seem to me to have done truly masterful work—that is, original work, completely divorced from the past—are: Morice, Moréas (a delightful poet), and, above all, the man who has given poetry the biggest boost, Henri de Régnier.[9] Like de Vigny,[10] he lives apart, at some distance from here, in retreat and silence. I greatly respect and admire him. His latest work, *Poémes anciens et romanesques,* is a pure masterpiece.

"So you can see," he said, shaking hands with me, "that, in the final analysis, all earthly existence must ultimately be contained in a book."

---

[7] Émile Zola (above page 698). Mallarmé was wrong about the disappearance of naturalism, which lasted somewhat longer.

[8] Gustave Flaubert (1821–1880), Edmond Goncourt (1822–1896), and Jules Goncourt (1830–1870), French novelists.

[9] Charles Morice (1861–1919), Jean Moréas (1856–1910), Henri de Régnier (1864–1936), all symbolist poets.

[10] Alfred Vigny (1799–1863), French writer.

The Book: A Spiritual Instrument

I am the author of a statement to which there have been varying reactions, including praise and blame, and which I shall make again in the present article. Briefly, it is this: all earthly existence must ultimately be contained in a book.[1]

It terrifies me to think of the qualities (among them genius, certainly) which the author of such a work will have to possess. I am one of the unpossessed. We will let that pass and imagine that it bears no author's name. What, then, will the work itself be? I answer: a hymn, all harmony and joy; an immaculate grouping of universal relationships come together for some miraculous and glittering occasion. Man's duty is to observe with the eyes of the divinity; for if his connection with that divinity is to be made clear, it can be expressed only by the pages of the open book in front of him.

Seated on a garden bench where a recent book is lying, I like to watch a passing gust half open it and breathe life into many of its outer aspects, which are so obvious that no one in the history of literature has ever thought about them. I shall have the chance to do so now, if I can get rid of my overpowering newspaper. I push it aside: it flies about and lands near some roses as if to hush their proud and feverish whispering; finally, it unfolds around them. I will leave it there along with the silent whispering of the flowers. I formally propose now to examine the differences between this rag and the book, which is supreme. The newspaper is the sea; literature flows into it at will.

Now then—

The foldings of a book, in comparison with the large-sized, open newspaper, have an almost religious significance. But an even greater significance lies in their thickness when they are piled together; for then they form a tomb in miniature for our souls.

Every discovery made by printers has hitherto been absorbed in the most elementary fashion by the newspaper, and can be summed up in the word: *press.* The result has been simply a plain sheet of paper upon which a flow of words is printed in the most unrefined manner. The immediacy of this system (which preceded the production of books) has undeniable advantages for the writer; with its endless line of posters and proof sheets it makes for improvisation. We have, in other words, a "daily paper." But who, then, can make the gradual discovery of the meaning of this format, or even of a sort of popular fairyland charm about it? Then again, the leader, which is the most important part, makes its great free way through a thousand obstacles and finally reaches a state of disinterestedness. But what is the result of this victory? It overthrows the advertisement (which is original slavery) and, as if it were itself the powered printing press, drives it far back beyond intervening articles onto the fourth page and leaves it there in a mass of incoherent and inarticulate cries. A noble spectacle, without question. After this, what else can the newspaper possibly need in order to overthrow the *book* (even though at the bottom—or rather at its foundation, i.e., the *feuilleton*[2]—it resembles the other in its pagination, thus generally regulating the columns)? It will need nothing, in fact; or practically nothing, if the book delays as it is now doing and carelessly continues to be a drain for it. And since even the book's format is useless, of what avail is that extraordinary addition of foldings (like wings in repose, ready to fly forth again) which constitute its rhythm and the chief reason for the secret contained in its pages? Of what avail the priceless silence living there, and evocative symbols following in its wake, to delight the mind which literature has totally delivered?

---

[1] Last sentence of the previous selection.

Yes, were it not for folding of the paper and the depths thereby established, that darkness scattered about in the forms of black characters could not rise and issue forth in gleams of mystery from the page to which we are about to turn.

The newspaper with its full sheet on display makes improper use of printing—that is, it makes good packing paper. Of course, the obvious and vulgar advantage of it, as everybody knows, lies in its mass production and circulation. But the advantage is secondary to a miracle, in the highest sense of the word: words led back to their origin, which is the twenty-four letters of the alphabet, so gifted with infinity that they will finally consecrate language. Everything is caught up in their endless variations and then rises out of them in the form of the principle. Thus typography becomes a rite.

The book, which is a total expansion of the letter, must find its mobility in the letter; and in its spaciousness must establish some nameless system of relationships which will embrace and strengthen fiction.

There is nothing fortuitous in all this, even though ideas may seem to be slaves of chance. The system guarantees them. Therefore we must pay no attention to the book industry with its materialistic considerations. The making of a book, with respect to its flowering totality, begins with the first sentence. From time immemorial the poet has knowingly placed his verse in the sonnet which he writes upon our minds or upon pure space. We, in turn, will misunderstand the true meaning of this book and the miracle inherent in its structure, if we do not knowingly imagine that a given motif has been properly placed at a certain height on the page, according to its own or to the book's distribution of light. Let us have no more of those successive, incessant, back and forth motions of our eyes, traveling from one line to the next and beginning all over again. Otherwise we will miss that ecstasy in which we become immortal for a brief hour, free of all reality, and raise our obsessions to the level of creation. If we do not actively create in this way (as we would music on the keyboard, turning the pages of a score), we would do better to shut our eyes and dream. I am not asking for any servile obedience. For, on the contrary, each of us has within him that lightninglike initiative which can link the scattered notes together.

Thus, in reading, a lonely, quiet concert is given for our minds, and they in turn, less noisily, reach its meaning. All our mental faculties will be present in this symphonic exaltation; but, unlike music, they will be rarefied, for they partake of thought. Poetry, accompanied by the idea, is perfect music, and cannot be anything else.[3]

Now, returning to the case at hand and to the question of books which are read in the ordinary way, I raise my knife in protest, like the cook chopping off chickens' heads.

The virginal foldings of the book are unfortunately exposed to the kind of sacrifice which caused the crimson-edged tomes of ancient times to bleed. I meant that they invite the paper-knife, which stakes our claims to possession of the book. Yet our consciousness alone gives us a far more intimate possession than such a barbarian symbol; for it joins the book now here, now there, varies its melodies, guesses its riddles, and even recreates it unaided. The folds will have a mark which remains intact and invites us to open or close the pages according to the author's desires. There can be only blindness and discourtesy in so murderous and self-destructive an attempt to destroy the fragile, inviolable book. The newspaper holds the advantage here, for it is not exposed to such treatment. But it is nonetheless an annoying influence; for upon the book—upon the divine and intricate organism required by literature—it inflicts the monotonousness of its eternally unbearable columns, which are merely strung down the pages by hundreds.

---

[2] The part of a page of a journal or newspaper, usually across the bottom, devoted to literary articles, light fiction, and so forth.

[3] By Mallarmé's time music has thoroughly replaced painting as the art regarded as closest to poetry.

"But," I hear someone say, "how can this situation be changed?" I shall take space here to answer this question in detail; for the work of art—which is unique or should be—must provide illustrations. A tremendous burst of greatness, of thought, or of emotion, contained in a sentence printed in large type, with one gradually descending line to a page, should keep the reader breathless throughout the book and summon forth his powers of excitement. Around this would be smaller groups of secondary importance, commenting on the main sentence or derived from it, like a scattering of ornaments.

It will be said, I suppose, that I am attempting to flabbergast the mob with a lofty statement. That is true. But several of my close friends must have noticed that there are connections between this and their own instinct for arranging their writings in an unusual and ornamental fashion, halfway between verse and prose. Shall I be explicit? All right, then, just to maintain that reputation for clarity so avidly pursued by our make-everything-clear-and-easy era. Let us suppose that a given writer reveals one of his ideas in theoretical fashion and, quite possibly, in useless fashion, since he is ahead of his time. He well knows that such revelations, touching as they do on literature, should be brought out in the open. And yet he hesitates to divulge too brusquely things which do not exist; and thus, in his modesty, and to the mob's amazement, he veils them over.

It is because of those daydreams we have before we resume our reading in a garden that our attention strays to a white butterfly flitting here and there, then disappearing; but also leaving behind it the same slight touch of sharpness and frankness with which I have presented these ideas, and flying incessantly back and forth before the people, who stand amazed.

Mystery in Literature

Any affirmations I make here, no matter how justified, are naturally going to be cannon fodder for the jokers in the mob.

Every work of art, apart from its inner treasure, should provide some sort of outward—or even indifferent—meaning through its words. A certain deference should be shown the people: for, after all, they *are* lending out their language, and the work is going to turn it to some unexpected account. It is just as well to keep idlers away; they are glad to see that the work does not apply to them—such, at least, is their first impression.

Each to his own way and no hard feelings.

And yet somehow there is a disquieting gleam from the depths of the work, hardly distinguishable from its outward show. The clever idlers become suspicious and tell us to stop; for in their considered opinion the meaning of the work is unintelligible.

Heaven help the poor slandered poet who happens to be involved! He will be crushed beneath an immense and rather silly joke. It has always been so; and now, more than ever before, the unanimous and excessive pestilence rages.

There is certainly something occult in men's hearts; I am convinced that there is something abstruse, something closed and hidden in the mob. For whenever she sniffs out the idea that obscurity may be a *reality;* that it may exist, for example, on a piece of paper, in a piece of writing (heaven forbid, of course, that it should exist within itself!), she rises up in a hurricane fury and, with thunders and lightnings, blames the darkness on anything but herself.

Her credulousness finds satisfaction in the corresponding agitations of her fellow citizens; she jumps to extremes. So that whatever that dark fiend from hell (i.e., the poet) may write henceforth, she will shake her head (quite unaware that she herself is the enigma) and, with a whisk of her skirt, assert: "I don't get it!"—even if the poor poet has simply stated that he is blowing his nose.

Obedient as he is to his inborn rhythmical sense, the poet naturally finds a lack of proportion between the storm's cause and effect.

Those fellow citizens, it seems to him, are wrong; following their avowed intention, they plunge their pens within a nightless well and lay only the useless, minimum foundation of intelligibility. Granted that the poet does this too—but that is not all he does. It is hardly discreet of them to rouse the mob to such a fury—the mob, remember! is the vessel of genius—and to pour forth pellmell the monumental stupidity of man.

And all this for a matter of no importance.

They play the game without rules and for useless stakes; they force our lady and patron saint[1] to reveal her dehiscence, her lacuna, her misunderstanding of special dreams which constitute the common measure of all things.

I know for a fact that they are the ones who rush on stage and parade around in humiliating fashion. For to base their arguments on obscurity, to say that they "don't get it" and that if they "don't get it" nobody will, means that they refuse to discriminate from the very outset.

---

[1] The Muse.

The scandal is typical, and it continues to be irrelevant.

It has to do with an undertaking which is of no literary importance—

Their undertaking—

Which consists of revealing only the monotonous outward aspects of the world, as newsboys do. Admittedly, they are struggling beneath the pressure of the moment; but in that situation it is clearly improper to write at all, save to spread banality abroad. What they fail to spread is the priceless mist that floats about the secret abyss of every human thought. All that is vulgar which receives no more than the stamp of immediacy. And although I hesitate to use an image to "put them in their place" personally, nevertheless the crudity of these bores is such that they give us, I would say, not a labyrinth lit by flowers and beckoning to our leisure, but a road lined with headaches and vertical plaster images of man's interminable blindness, with no hidden fountains or greenery bending above them, but only green bottle bottoms and bristling broken glass.

Even the advertisers shy away from it all.

Now, let us imagine a steady brilliance which, even when intermittent, does not seem to be merely momentary.

Music came along and put an end to that kind of work.

For at some point in the composition, a motif breaks through the musical veils of our imagination and frees itself of their unceasing immobility, which is alternately compacted or dissolved through conscious art.

Such is the ordinary way.

Or else the composition can begin with a triumphant burst of sound too sudden to last; then the surprise dies away in a group of hesitating notes which its echo has liberated.

Then again, there is the reverse order: the hesitations are folded darkly together and rumor forth a particular obsession of the mind; they are crowded and massed together; and then out of them arises an ultimate and essential brilliance.

Such is the twin, intellectual fashion found particularly in symphonies which, in turn, found it in the repertory of nature and of the sky.

Yes, I know; mystery is said to be music's domain. But the written word also lays claim to it.

Yes, the supreme and heart-rending musical moments are born of fleeting arabesques, and their bursting is more true, more central, more brilliant than any reasoning. When we consider their matchless efficacy, we feel unable to translate them into any language save that of the listener's ideas. Their contact with our spirit is direct and fitting; we feel somehow that words would be discordant and unwelcome.

And yet the written word, which is the ideal in noiseless flight from earth, regains its rights as it stands beneath that fall of virginal sounds. Both music and lyric call for the previous discarding of the spoken word, of course, in order to prevent mere talking.

In a single surge of opposites, the one descends, the other flies away, and yet the same silken veils follow in the wake of both.

Let me pause now and quietly add this parenthesis. It has always been my purpose that stylistic coloring should be neutral: neither should it be darkened in a dive nor brightly shimmer or splash; nor subject to the alternative, which is rules.

What sure guide is there to intelligibility in the midst of these contrasts? What guarantee?

Syntax.

I do not mean simply such spontaneous twists as are inherent in the facility of conversation, even though they are essential to oratory. The French language in particular is elegant when it appears in negligee. As history will show, this is one of the original French characteristics, one of the nation's truly exquisite natures. But our literature goes beyond this "fashion"; it does not consist merely of correspondence and memoirs. It has its quick high flutterings as well; and when these are on the wing, the writer can observe how extraordinarily well the limpid structure of the language receives the primitive thunderbolts of logic. The sentence may seem to stammer at first, hold back in a knot of incidental bits; then it multiplies, takes on order, and rises up in a noble harmony, wavering all the while in its knowing transpositions.

For those who may be surprised and angered by the broad application of my words, I shall describe the revels of this language.

Words rise up unaided and in ecstasy; many a facet reveals its infinite rarity and is precious to our mind. For our mind is the center of this hesitancy and oscillation; it sees the words not in their usual order, but in projection (like the walls of a cave), so long as that mobility which is their principle lives on, that part of speech which is not spoken. Then quickly, before they die away, they all exchange their brilliancies from afar; or they may touch, and steal a furtive glance.

The argument that a certain indispensable and pedestrian clarity may be lacking here and there is a matter for grammarians. And even if the poor reader were to misread these words continually, his understanding of the slush which makes up the current literary fashion is not much better, and so there is hardly any need to distinguish him from the truly malicious. For he too speaks angrily and insultingly of obscurity. Yet why does he not consider literature's common stock and speak angrily and insultingly of *its* incoherence, its drivel, its plagiarism (not to mention any other deterrent or special accusation); or, again, he might well speak of its platitudes, with particular reference to those who are the first to cry "obscurity!" in order to avoid taxing the public's brains.

To answer these threats, I shall simply observe that several of my contemporaries don't know how to read.

The newspaper, yes; they can read that; it has the advantage of not interrupting the day's routine.

Reading—

Is an exercise—

We must bend our independent minds, page by page, to the blank space which begins each one; we must forget the title, for it is too resounding. Then, in the tiniest and most scattered stopping points upon the page, when the lines of chance have been vanquished word by word, the blanks unfailingly return; before, they were gratuitous; now they are essential; and now at last it is clear that nothing lies beyond; now silence is genuine and just.

It is a virgin space, face to face with the lucidity of our matching vision, divided of itself, in solitude, into halves of whiteness; and each of these is lawful bride at the wedding of the idea.

Thus the invisible air, or song, beneath the words leads our divining eye from word to music; and thus, like a motif, invisibly it inscribes its fleuron and pendant there.

Gottlob Frege

1848–1925

Frege's essay "On Sense and Meaning" (1892) takes up a fundamental philosophical problem pertaining to both epistemology and differentiations in semantic matters. The essay was crucial for the development of philosophical analysis and logical positivism, reflected here in the work of Bertrand Russell (below, page 811), Ludwig Wittgenstein (below, page 823), and Rudolph Carnap (below, page 978). But it also expands analysis from mathematics and formal logic to language, which became the principal interest, and often obsession, of diverse twentieth-century philosophers and literary critics.

Frege's terms "sense" (*Sinn*) and "meaning" (*Bedeutung*) require brief discussion here. Frege's *Bedeutung* was earlier translated as "reference" because of the systematic importance he gives to "meaning" as a cognitive relation to a designatable object. In the case of a=b, (if true) it is assumed that *a* and *b* are both names for the same object, say the number 1; their "equality" implies they have the same "meaning." In the case of the planet Venus, the expressions "morning star" and "evening star" have each a different sense but the same meaning: Venus. While this permits Frege to identify meaning with the "truth value" of expressions (a point of importance for Wittgenstein), it also opens up the puzzle, later to vex logical positivism, of meaningful statements (e. g., "the least rapidly convergent series") that seem to refer to something that evidently cannot be designated. Frege acknowledges that sense is related to both "thought" and "idea," which may vary from person to person without being merely subjective or arbitrary, but this by no means solves the puzzle. Instead, it opens up Frege's analysis to problems concerning the abstract, the hypothetical—and the literary—in ways that are particularly intriguing today.

In Frege's terms, "Odysseus" does have sense, but does it have a meaning? To anyone who thought a statement about Odysseus either true or false, the name would have to have meaning; but whether true or false, a sentence about Odysseus would have sense. In the case of an actor and part, mentioned by Frege in a footnote, it appears that a statement having truth-value offstage is only a thought (has sense) in a play. We might go on to ask whether John Gielgud playing Hamlet and the character Hamlet have the same sense, let alone the same meaning. Frege recognizes a problem here, but he avoids it, calling both "representations," but representations of what? Frege holds that to ask for the truth-value of a statement in, say, a play would "cause us to abandon aesthetic delight for an attitude of scientific investigation," which is, in effect, a move to cordon off the aesthetic without considering its implications for knowledge. The problem is ancient: Sidney (above, page 198) could treat the anomalous status of literary fictions, neither true nor false, as a form of moral teaching by way of figures. Not Frege.

It is therefore ironic that Frege's concerns led directly to paradoxes over the ontological status of things with sense but no meaning—such as logical sets in Russell, "pseudo-statements" in Richards and Carnap, or the theoretical "entities" in Carnap's later work that come to seem very much like literary fictions.

Works by Frege translated into English include *The Foundations of Arithmetic* (1953), *The Basic Laws of Arithmetic* (1964), and *Translations from the Philosophical Writings of Gottlob Frege* (1960). See E. D. Klemke, ed., *Essays on Frege* (1968). On a related subject see Saul Kripke, *Naming and Necessity* (1980).

On Sense and Meaning

Equality[1] gives rise to challenging questions which are not altogether easy to answer. Is it a relation? A relation between objects, or between names or signs of objects? In my *Begriffsschrift*[2] I assumed the latter. The reasons which seem to favour this are the following: $a = a$ and $a = b$ are obviously statements of differing cognitive value; $a = a$ holds *a priori* and, according to Kant,[3] is to be labelled analytic, while statements of the form $a = b$ often contain very valuable extensions of our knowledge and cannot always be established *a priori*. The discovery that the rising sun is not new every morning, but always the same, was one of the most fertile astronomical discoveries. Even to-day the reidentification of a small planet or a comet is not always a matter of course. Now if we were to regard equality as a relation between that which the names '*a*' and '*b*' designate, it would seem that $a = b$ could not differ from $a = a$ (i.e., provided $a = b$ is true). A relation would thereby be expressed of a thing to itself, and indeed one in which each thing stands to itself but to no other thing. What we apparently want to state by $a = b$ is that the signs or names '*a*' and '*b*' designate the same thing, so that those signs themselves would be under discussion; a relation between them would be asserted. But this relation would hold between the names or signs only in so far as they named or designated something. It would be mediated by the connexion of each of the two signs with the same designated thing. But this is arbitrary. Nobody can be forbidden to use any arbitrarily producible event or object as a sign for something. In that case the sentence $a = b$ would no longer refer to the subject matter but only to its mode of designation; we would express no proper knowledge by its means. But in many cases this is just what we want to do. If the sign '*a*' is distinguished from the sign '*b*' only as an object (here, by means of its shape), not as a sign (i.e., not by the manner in which it designates something), the cognitive value of $a = a$ becomes essentially equal to that of $a = b$, provided $a = b$ is true. A difference can arise only if the difference between the signs corresponds to a difference in the mode of presentation of the thing designated. Let a, b, c be the lines connecting the vertices of a triangle with the midpoints of the opposite sides. The point of intersection of a and b is then the same as the point of intersection of b and c. So we have different designations for the same point, and these names ('point of intersection of a and b,' 'point of intersection of b and c') likewise indicate the mode of presentation; and hence the statement contains actual knowledge.

It is natural, now, to think of there being connected with a sign (name, combination of words, written mark), besides that which the sign designates, which may be called the meaning of the sign, also what I should like to call the *sense* of the sign, wherein the mode of presentation is contained. In our example, accordingly, the meaning of the expressions 'the point of intersection of a and b' and 'the point of intersection of b and c' would be the same, but not their sense. The meaning of 'evening star' would be the same as that of 'morning star,' but not the sense.

It is clear from the context that by sign and name I have here understood any designation figuring as a proper name, which thus has as its meaning a definite object (this word taken in the widest range), but not a concept or a relation, which shall be discussed further in another article.[4] The designation of a single object can also consist of several words or other signs. For brevity, let every such designation be called a proper name.

The sense of a proper name is grasped by everybody who is sufficiently familiar with the language or totality of designations to which it belongs;[5] but this serves to illuminate

---

"On Sense and Meaning" was first published in 1892. This translation by Max Black is reprinted from Peter Geach and Max Black, eds., *Translations from the Philosophical Writings of Gottlob Frege*, third edition, 1980.

[1] [Frege] I use this word in the sense of identity and understand "$a = b$" to have the sense of "a is the same as b" or "a and b coincide."

[2] [Black] The reference is to Frege's *Begriffsschrift, eine der arithmetischen nachgebildete Formelsprache des reinen Denkens* (Halle, 1879).

[3] Kant (above, page 416).

[4] [Black] See his "Ueber Begriff und Gegenstand" (*Vierteljahrsschrift für wissenschaftliche Philosophie* XVI [1892], 192–205) in *Translations*, pages 42–55.

[5] [Frege] In the case of an actual proper name such as "Aristotle" opinions as to the sense may differ. It might, for instance, be taken to be the following: the pupil of Plato and teacher of Alexander the Great. Anybody who does this will attach another sense to the sentence "Aristotle was born in Stagira" than will a man who takes as the sense of the name: the teacher of Alexander the Great who was born in Stagira. So long as the thing meant remains the same, such variations of sense may be tolerated, although they are to be avoided in the theoretical structure of a demonstrative science and ought not to occur in a perfect language.

only a single aspect of the thing meant, supposing it to have one. Comprehensive knowledge of the thing meant would require us to be able to say immediately whether any given sense attaches to it. To such knowledge we never attain.

The regular connexion between a sign, its sense, and what it means is of such a kind that to the sign there corresponds a definite sense and to that in turn a definite thing meant, while to a given thing meant (an object) there does not belong only a single sign. The same sense has different expressions in different languages or even in the same language. To be sure, exceptions to this regular behavior occur. To every expression belonging to a complete totality of signs, there should certainly correspond a definite sense; but natural languages often do not satisfy this condition, and one must be content if the same word has the same sense in the same context. It may perhaps be granted that every grammatically well-formed expression figuring as a proper name always has a sense. But this is not to say that to the sense there also corresponds a thing meant. The words 'the celestial body most distant from the Earth' have a sense, but it is very doubtful if there is also a thing they mean. The expression 'the least rapidly convergent series' has a sense but demonstrably there is nothing it means, since for every given convergent series, another convergent, but less rapidly convergent, series can be found. In grasping a sense, one is not certainly assured of meaning anything.

If words are used in the ordinary way, what one intends to speak of is what they mean. It can also happen, however, that one wishes to talk about the words themselves or their sense. This happens, for instance, when the words of another are quoted. One's own words then first designate words of the other speaker, and only the latter have their usual meaning. We then have signs of signs. In writing, the words are in this case enclosed in quotation marks. Accordingly, a word standing between quotation marks must not be taken as having its ordinary meaning.

In order to speak of the sense of an expression 'A' one may simply use the phrase 'the sense of the expression "A" '. In indirect speech one talks about the sense, e.g., of another person's remarks. It is quite clear that in this way of speaking words do not have their customary meaning but designate what is usually their sense. In order to have a short expression, we will say: In indirect speech, words are used *indirectly* or have their *indirect* meaning. We distinguish accordingly the *customary* from the *indirect* meaning of a word; and its *customary* sense from its *indirect* sense. The indirect meaning of a word is accordingly its customary sense. Such exceptions must always be borne in mind if the mode of connexion between sign, sense, and meaning in particular cases is to be correctly understood.

The meaning and sense of a sign are to be distinguished from the associated idea. If what a sign means is an object perceivable by the senses, my idea of it is an internal image,[6] arising from memories of sense impressions which I have had and acts, both internal and external, which I have performed. Such an idea is often imbued with feeling; the clarity of its separate parts varies and oscillates. The same sense is not always connected, even in the same man, with the same idea. The idea is subjective: one man's idea is not that of another. There result, as a matter of course, a variety of differences in the ideas associated with the same sense. A painter, a horseman, and a zoologist will probably connect different ideas with the name 'Bucephalus.'[7] This constitutes an essential distinction between the idea and sign's sense, which may be the common property of many people, and so is not a part of a mode of the individual mind. For one can hardly deny that mankind has a common store of thoughts which is transmitted from one generation to another.[8]

In the light of this, one need have no scruples in speaking simply of *the* sense, whereas in the case of an idea one must, strictly speaking, add whom it belongs to and at what time. It might perhaps be said: Just as one man connects this idea, and another that idea, with the same word, so also one man can associate this sense and another that sense. But there still remains a difference in the mode of connexion. They are not prevented from grasping the same sense; but they cannot have the same idea. *Si duo idem faciunt, non est idem.* If two persons picture the same thing, each still has his own idea. It is indeed sometimes possible to establish differences in the ideas, or even in the sensations, of different men; but an exact comparison is not possible, because we cannot have both ideas together in the same consciousness.

The meaning of a proper name is the object itself which we designate by using it; the idea which we have in that case is wholly subjective; in between lies the sense, which is indeed no longer subjective like the idea, but is yet not the object itself. The following analogy will perhaps clarify these relationships. Somebody observes the Moon through a telescope. I compare the Moon itself to the meaning; it is the object of the observation, mediated by the real image projected by the object glass in the interior of the telescope, and by the retinal image of the observer. The former I compare to the sense, the latter is like the idea or experience. The optical image in the telescope is indeed one-sided and dependent upon the standpoint of observation; but it is still objective, inasmuch as it can be used by several observers. At any rate it could be arranged for several to use it simultaneously. But each one would have his own retinal image. On account of the diverse shapes of the observers' eyes, even a geometrical congruence could hardly be achieved, and an actual coincidence would be out of the question. This analogy might be developed still further, by assuming A's retinal image made visible to B; or A might also see his own retinal image in a mirror. In this way we might perhaps show how an idea can itself be taken as an object, but as such is not for the observer what it directly is for the person having the idea. But to pursue this would take us too far afield.

---

[6] [Frege] We may include with ideas direct experiences: here, sense-impressions and acts themselves take the place of the traces which they have left in the mind. The distinction is unimportant for our purpose, especially since memories of sense-impressions and acts go along with such impressions and acts themselves to complete the perpetual image. One may on the other hand understand direct experience as including any object in so far as it is sensibly perceptible or spatial.

[7] Alexander the Great's horse.

[8] [Frege] Hence it is inadvisable to use the word "idea" to designate something so basically different.

We can now recognize three levels of difference between words, expressions, or whole sentences. The difference may concern at most the ideas, or the sense but not the meaning, or, finally, the meaning as well. With respect to the first level, it is to be noted that, on account of the uncertain connexion of ideas with words, a difference may hold for one person, which another does not find. The difference between a translation and the original text should properly not overstep the first level. To the possible difference here belong also the colouring and shading which poetic eloquence seeks to give to the sense. Such colouring and shading are not objective, and must be evoked by each hearer or reader according to the hints of the poet or the speaker. Without some affinity in human ideas art would certainly be impossible; but it can never be exactly determined how far the intentions of the poet are realized.

In what follows there will be no further discussion of ideas and experiences; they have been mentioned here only to ensure that the idea aroused in the hearer by a word shall not be confused with its sense or its meaning.

To make short and exact expressions possible, let the following phraseology be established:

A proper name (word, sign, sign combination, expression) *expresses* its sense, *means* or *designates* its meaning. By employing a sign we express its sense and designate its meaning.

Idealists or sceptics will perhaps long since have objected: 'You talk, without further ado, of the Moon as an object; but how do you know that the name "the Moon" has any meaning? How do you know that anything whatsoever has a meaning?' I reply that when we say 'the Moon,' we do not intend to speak of our idea of the Moon, nor are we satisfied with the sense alone, but we presuppose a meaning. To assume that in the sentence 'The Moon is smaller than the Earth' the idea of the Moon is in question, would be flatly to misunderstand the sense. If this is what the speaker wanted, he would use the phrase 'my idea of the Moon.' Now we can of course be mistaken in the presupposition, and such mistakes have indeed occurred. But the question whether the presupposition is perhaps always mistaken need not be answered here; in order to justify mention of that which a sign means it is enough, at first, to point our intention in speaking or thinking. (We must then add the reservation: provided such a meaning exists.)

So far we have considered the sense and meaning only of such expressions, words, or signs as we have called proper names. We now inquire concerning the sense and meaning of an entire assertoric sentence. Such a sentence contains a thought.[9] Is this thought, now, to be regarded as its sense or its meaning? Let us assume for the time being that the sentence does mean something. If we now replace one word of the sentence by another having the same meaning, but a different sense, this can have no effect upon the meaning of the sentence. Yet we can see that in such a case the thought changes; since, e.g., the thought in the sentence 'The morning star is a body illuminated by the Sun' differs from that in the sentence 'The evening star is a body illuminated by the Sun.' Anybody who did not know that the evening star is the morning star might hold the one thought to be true, the other false. The thought, accordingly, cannot be what is meant by the sentence, but must rather be considered as its sense. What is the position now with regard to the meaning? Have we a right even to inquire about it? Is it possible that a sentence as a whole has only a sense, but no meaning? At any rate, one might expect that such sentences occur, just as there are parts of sentences having sense but no meaning. And sentences which contain proper names without meaning will be of this kind. The sentence 'Odysseus was set ashore at Ithaca while sound asleep' obviously has a sense. But since it is doubtful whether the name 'Odysseus,' occurring therein, means anything, it is also doubtful whether the whole sentence does. Yet it is certain, nevertheless, that anyone who seriously took the sentence to be true or false would ascribe to the name 'Odysseus' a meaning, not merely a sense; for it is of what the name means that the predicate is affirmed or denied. Whoever does not admit the name has meaning can neither apply nor withhold the predicate. But in that case it would be superfluous to advance to what the name means; one could be satisfied with the sense, if one wanted to go no further than the thought. If it were a question only of the sense of the sentence, the thought, it would be needless to bother with what is meant by a part of the sentence; only the sense, not the meaning, of the part is relevant to the sense of the whole sentence. The thought remains the same whether 'Odysseus' means something or not. The fact that we concern ourselves at all about what is meant by a part of the sentence indicates that we generally recognize and expect a meaning for the sentence itself. The thought loses value for us as soon as we recognize that the meaning of one of its parts is missing. We are therefore justified in not being satisfied with the sense of a sentence, and in inquiring also as to its meaning. But now why do we want every proper name to have not only a sense, but also a meaning? Why is the thought not enough for us? Because, and to the extent that, we are concerned with its truth-value. This is not always the case. In hearing an epic poem, for instance, apart from the euphony of the language we are interested only in the sense of the sentences and the images and feelings thereby aroused. The question of truth would cause us to abandon aesthetic delight for an attitude of scientific investigation. Hence it is a matter of no concern to us whether the name 'Odysseus,' for instance, has meaning, so long as we accept the poem as a work of art.[10] It is the striving for truth that drives us always to advance from the sense to the thing meant.

---

[9] [Frege] By a thought I understand not the subjective performance of thinking but its objective content, which is capable of being the common property of several thinkers.

We have seen that the meaning of a sentence may always be sought, whenever the meaning of its components is involved; and that this is the case when and only when we are inquiring after the truth-value.

We are therefore driven into accepting the *truth-value* of a sentence as constituting what it means. By the truth-value of a sentence I understand the circumstance that it is true or false. There are no further truth-values. For brevity I call the one the True, the other the False. Every assertoric sentence concerned with what its words mean is therefore to be regarded as a proper name, and its meaning, if it has one, is either the True or the False. These two objects are recognized, if only implicitly, by everybody who judges something to be true—and so even by a sceptic. The designation of the truth-values as objects may appear to be an arbitrary fancy or perhaps a mere play upon words, from which no profound consequences could be drawn. What I am calling an object can be more exactly discussed only in connexion with concept and relation. I will reserve this for another article.[11] But so much should already be clear, that in every judgment,[12] no matter how trivial, the step from the level of thoughts to the level of meaning (the objective) has already been taken.

One might be tempted to regard the relation of the thought to the True not as that of sense to meaning, but rather as that of subject to predicate. One can, indeed, say: 'The thought that 5 is a prime number is true.' But closer examination shows that nothing more has been said than in the simple sentence '5 is a prime number.' The truth claim arises in each case from the form of the assertoric sentence, and when the latter lacks its usual force, e.g., in the mouth of an actor upon the stage, even the sentence 'The thought that 5 is a prime number is true' contains only a thought, and indeed the same thought as the simple '5 is a prime number.' It follows that the relation of the thought to the True may not be compared with that of subject to predicate.

Subject and predicate (understood in the logical sense) are just elements of thought; they stand on the same level for knowledge. By combining subject and predicate, one reaches only a thought, never passes from sense to meaning, never from a thought to its truth-value. One moves at the same level but never advances from one level to the next. A truth-value cannot be a part of a thought, any more than, say, the Sun can, for it is not a sense but an object.

If our supposition that the meaning of a sentence is its truth-value is correct, the latter must remain unchanged when a part of the sentence is replaced by an expression with the same meaning. And this is in fact the case. Leibniz gives the definition: *'Eadem sunt, quae sibi mutuo substitui possunt, salva veritate.'* If we are dealing with sentences for which the meaning of their component parts is at all relevant, then what feature except the truth-value can be found that belongs to such sentences quite generally and remains unchanged by substitutions of the kind just mentioned?

If now the truth-value of a sentence is its meaning, then on the one hand all true sentences have the same meaning and so, on the other hand, do all false sentences. From this we see that in the meaning of the sentence all that is specific is obliterated. We can never be concerned only with the meaning of a sentence; but again the mere thought alone yields no knowledge, but only the thought together with its meaning, i.e. its truth-value. Judgments can be regarded as advances from a thought to a truth-value. Naturally this cannot be a definition. Judgment is something quite peculiar and incomparable. One might also say that judgments are distinctions of parts within truth-values. Such distinction occurs by a return to the thought. To every sense attaching to a truth-value would correspond its own manner of analysis. However, I have here used the word 'part' in a special sense. I have in fact transferred the relation between the parts and the whole of the sentence to its meaning, by calling the meaning of a word part of the meaning of the sentence, if the word itself is a part of the sentence. This way of speaking can certainly be attacked, because the total meaning and one part of it do not suffice to determine the remainder, and because the word 'part' is already used of bodies in another sense. A special term would need to be invented.

---

[10] [Frege] It would be desirable to have a special term for signs having only sense. If we name them, say, representations, the words of the actors on the stage would be representations; indeed the actor himself would be a representation.

[11] [Black] See his "Ueber Begriff und Gegenstand" (1892), in *Translations*, pages 42–45. [See Note 4 above.]

[12] [Frege] A judgment, for me, is not the mere grasping of a thought, but the admission of its truth.

The supposition that the truth-value of a sentence is what it means shall now be put to further test. We have found that the truth-value of a sentence remains unchanged when an expression is replaced by another with the same meaning: but we have not yet considered the case in which the expression to be replaced is itself a sentence. Now if our view is correct, the truth-value of a sentence containing another as part must remain unchanged when the part is replaced by another sentence having the same truth-value. Exceptions are to be expected when the whole sentence or its part is direct or indirect quotation; for in such cases as we have seen, the words do not have their customary meaning. In direct quotation, a sentence designates another sentence, and in indirect speech a thought.

We are thus led to consider subordinate sentences or clauses. These occur as parts of a sentence complex, which is, from the logical standpoint, likewise a sentence—a main sentence. But here we meet the question whether it is also true of the subordinate sentence that its meaning is a truth-value. Of indirect speech we already know the opposite. Grammarians view the subordinate clauses as representatives of parts of sentences and divide them accordingly into noun clauses, adjective clauses, adverbial clauses. This might generate the supposition that the meaning of a subordinate clause was not a truth-value but rather of the same kind as the meaning of a noun or adjective or adverb—in short, of a part of a sentence, whose sense was not a thought but only a part of a thought. Only a more thorough investigation can clarify the issue. In so doing, we shall not follow the grammatical categories strictly, but rather group together what is logically of the same kind. Let us first search for cases in which the sense of the subordinate clause, as we have just supposed, is nor an independent thought.

The case of an abstract[13] noun clause, introduced by 'that,' includes the case of indirect quotation, in which we have seen the words to have their indirect meaning, coincident with what is customarily their sense. In this case, then, the subordinate clause has for its meaning a thought, not a truth-value; as sense not a thought, but the sense of the words 'the thought that (etc.),' which is only a part of the thought in the entire complex sentence. This happens after 'say,' 'hear,' 'be of the opinion,' 'be convinced,' 'conclude,' and similar words.[14] There is a different, and indeed somewhat complicated, situation after words like 'perceive,' 'know,' 'fancy,' which are to be considered later.

That in the cases of the first kind the meaning of the subordinate clause is in fact the thought can also be recognized by seeing that it is indifferent to the truth of the whole whether the subordinate clause is true or false. Let us compare, for instance, the two sentences 'Copernicus believed that the planetary orbits are circles' and 'Copernicus believed that the apparent motion of the sun is produced by the real motion of the Earth.' One subordinate clause can be substituted for the other without harm to the truth. The main clause and the subordinate clause together have as their sense only a single thought, and the truth of the whole includes neither the truth nor the untruth of the subordinate clause. In such cases it is not permissible to replace one expression in the subordinate clause by another having the same customary meaning, but only by one having the same indirect meaning, i.e. the same customary sense. Somebody might conclude: The meaning of a sentence is not its truth-value, for in that case it could always be replaced by another sentence of the same truth-value. But this proves too much; one might just as well claim that the meaning of 'morning star' is not Venus, since one may not always say 'Venus' in place of 'morning star.' One has the right to conclude only that the meaning of a sentence is not *always* its truth-value, and that 'morning star' does not always mean the planet Venus, viz, when the word has its indirect meaning. An exception of such a kind occurs in the subordinate clause just considered which has a thought as its meaning.

If one says 'It seems that . . .' one means 'It seems to me that . . .' or 'I think that . . .' We therefore have the same case again. The situation is similar in the case of expressions such as 'to be pleased,' 'to regret,' 'to approve,' 'to blame,' 'to hope,' 'to fear.' If, toward the end of the battle of Waterloo,[15] Wellington was glad that the Prussians were coming, the basis for his joy was a conviction. Had he been deceived, he would have been no less pleased so long as his illusion lasted; and before he became so convinced he could not have been pleased that the Prussians were coming—even though in fact they might have been already approaching.

---

[13] [Black] Frege probably means clauses grammatically replaceable by an abstract noun-phrase; for example, "Smith denies *that dragons exist*"—"Smith denies *the existence of dragons*"; or again in this context after "denies," "that Brown is wise" is replaceable by "the wisdom of Brown."

[14] [Frege] in *"A lied in saying he had seen B,"* the subordinate clause designates a thought which is said (1) to have been asserted by *A* (2) while *A* was convinced of its falsity.

Just as a conviction or a belief is the ground of a feeling, it can, as in inference, also be the ground of a conviction. In the sentence: 'Columbus inferred from the roundness of the Earth that he could reach India by travelling towards the west,' we have as the meanings of the parts two thoughts, that the Earth is round, and that Columbus by travelling to the west could reach India. All that is relevant here is that Columbus was convinced of both, and that the one conviction was a ground for the other. Whether the Earth is really round and Columbus could really reach India by travelling west, as he thought, is immaterial to the truth of our sentence; but it is not immaterial whether we replace 'the Earth' by 'the planet which is accompanied by a moon whose diameter is greater than the fourth part of its own.' Here also we have the indirect meaning of the words.

Adverbial final clauses beginning 'in order that' also belong here; for obviously the purpose is a thought; therefore: indirect meaning for the words, subjunctive mood.

A subordinate clause with 'that' after 'command,' 'ask,' 'forbid,' would appear in direct speech as an imperative. Such a sentence has no meaning but only a sense. A command, a request, are indeed not thoughts, but they stand on the same level as thoughts. Hence in subordinate clauses depending upon 'command,' 'ask,' etc., words have their indirect meaning. The meaning of such a clause is therefore not a truth-value but a command, a request, and so forth.

The case is similar for the dependent question in phrases such as 'doubt whether,' 'not to know what.' It is easy to see that here also the words are to be taken to have their indirect meaning. Dependent clauses expressing questions and beginning with 'who,' 'what,' 'where,' 'when,' 'how,' 'by what means,' etc., seem at times to approximate very closely to adverbial clauses in which words have their customary meanings. These cases are distinguished linguistically [in German] by the mood of the verb. With the subjunctive, we have a dependent question and indirect meanings of the words, so that a proper name cannot in general be replaced by another name of the same object.

In the cases so far considered the words of the subordinate clauses had their indirect meaning, and this made it clear that the meaning of the subordinate clause itself was indirect, i.e., not a truth-value but a thought, a command, a request, a question. The subordinate clause could be regarded as a noun, indeed one could say: as a proper name of that thought, that command, etc., which it represented in the context of the sentence structure.

We now come to other subordinate clauses, in which the words do have their customary meaning without however a thought occurring as sense and a truth-value as meaning. How this is possible is best made clear by examples.

> Whoever discovered the elliptic form of the planetary orbits died in misery.

If the sense of the subordinate clause were here a thought, it would have to be possible to express it also in a separate sentence. But it does not work, because the grammatical subject 'whoever' has no independent sense and only mediates the relation with the consequent clause 'died in misery.' For this reason the sense of the subordinate clause is not a complete thought, and what it means is Kepler, not a truth value. One might object that the sense of the whole does contain a thought as part, viz. that there was somebody who first discovered the elliptic form of the planetary orbits; for whoever takes the whole to be true cannot deny this part. This is undoubtedly so; but only because otherwise the dependent clause 'whoever discovered the elliptic form of the planetary orbits' would have nothing to mean. If anything is asserted there is always an obvious presupposition that the simple or compound proper names used have meaning. If therefore one asserts 'Kepler died in misery,' there is a presupposition that the name 'Kepler' designates something; but it does not follow that the sense of the sentence 'Kepler died in misery' contains the thought that the name 'Kepler' designates something. If this were the case the negation would have to run not

> Kepler did not die in misery

but

> Kepler did not die in misery, or the name 'Kepler' has no reference.

---

[15] [Black] Frege uses the Prussian name for the battle—*Belle Alliance.*

That the name 'Kepler' designates something is just as much a presupposition for the assertion

> Kepler died in misery

as for the contrary assertion. Now languages have the fault of containing expressions which fail to designate an object (although their grammatical form seems to qualify them for that purpose) because the truth of some sentence is a prerequisite. Thus it depends on the truth of the sentence:

> There was someone who discovered the elliptic form of the planetary orbits

whether the subordinate clause

> Whoever discovered the elliptic form of the planetary orbits.

really designates an object, or only seems to do so while in fact there is nothing for it to mean. And thus it may appear as if our subordinate clause contained as a part of its sense the thought that there was somebody who discovered the elliptic form of the planetary orbits. If this were right the negation would run:

> Either whoever discovered the elliptic form of the planetary orbits did not die in misery or there was nobody who discovered the elliptic form of the planetary orbits.

This arises from an imperfection of language, from which even the symbolic language of mathematical analysis is not altogether free; even there combinations of symbols can occur that seem to mean something but (at least so far) do not mean anything, e.g. divergent infinite series. This can be avoided, e.g., by means of the special stipulation that divergent infinite series shall mean the number 0. A logically perfect language *(Begriffsschrift)* should satisfy the conditions, that every expression grammatically well constructed as a proper name out of signs already introduced shall in fact designate an object, and that no new sign shall be introduced as a proper name without being secured a meaning. The logic books contain warnings against logical mistakes arising from the ambiguity of expressions. I regard as no less pertinent a warning against apparent proper names without any meaning. The history of mathematics supplies errors which have arisen in this way. This lends itself to demagogic abuse as easily as ambiguity—perhaps more easily. 'The will of the people' can serve as an example; for it is easy to establish that there is at any rate no generally accepted meaning for this expression. It is therefore by no means unimportant to eliminate the source of these mistakes, at least in science, once and for all. Then such objections as the one discussed above would become impossible, because it could never depend upon the truth of a thought whether a proper name had meaning.

With the consideration of these noun clauses may be coupled that of types of adjective and adverbial clauses which are logically in close relation to them.

Adjective clauses also serve to construct compound proper names, though, unlike noun clauses, they are not sufficient by themselves for this purpose. These adjective clauses are to be regarded as equivalent to adjectives. Instead of 'the square root of 4 which is smaller than 0,' one can also say 'the negative square root of 4.' We have here the case of a compound proper name constructed from the expression for a concept with the help of the singular definite article. This is at any rate permissible if the concept applies to one and only one single object.[16]

Expressions for concepts can be so constructed that marks of a concept are given by adjective clauses as, in our example, by the clause 'which is smaller than 0.' It is evident that such an adjective clause cannot have a thought as sense or a truth-value as meaning, any more than the noun clause could. Its sense, which can also in many cases be expressed by a single adjective, is only a part of a thought. Here, as in the case of the noun clause, there is no independent subject and therefore no possibility of reproducing the sense of the subordinate clause in an independent sentence.

Places, instants, stretches of time, logically considered, are objects; hence the linguistic designation of a definite place, a definite instant, or a stretch of time is to be regarded as a proper name. Now adverbial clauses of place and time can be used to construct such a proper name in much the same way as we have seen noun and adjective clauses can. In the same way, expressions for concepts that apply to places, etc., can be constructed. It is to be noted here also that the sense of these subordinate clauses cannot be reproduced in an independent sentence, since an essential component, viz. the determination of place or time, is missing and is just indicated by a relative pronoun or a conjunction.[17]

---

[16] [Frege] In accordance with what was said before, an expression of the kind in question must actually always be assured of meaning, by means of a special stipulation, for example, by the convention that it shall count as meaning 0 when the concept applies to no object or to more than one. [In this context, see Russell (below, page 811).]

In conditional clauses, also, there most often recognizably occurs an indefinite indicator, with a correlative indicator in the dependent clause. (We have already seen this occur in noun, adjective, and adverbial clauses.) In so far as each indicator relates to the other, both clauses together form a connected whole, which as a rule expresses only a single thought. In the sentence

> If a number is less than 1 and greater than 0,
> its square is less than 1 and greater than 0

the component in question is 'a number' in the antecedent clause and 'its' in the consequent clause. It is by means of this very indefiniteness that the sense acquires the generality expected of a law. It is this which is responsible for the fact that the antecedent clause alone has no complete thought as its sense and in combination with the consequent clause expresses one and only one thought, whose parts are no longer thoughts. It is, in general, incorrect to say that in the hypothetical judgment two judgments are put in reciprocal relationship. If this or something similar is said, the word 'judgment' is used in the same sense as I have connected with the word 'thought,' so that I would use the formulation: 'A hypothetical thought establishes a reciprocal relationship between two thoughts.' This could be true only if an indefinite indicator is absent;[18] but in such a case there would also be no generality.

If an instant of time is to be indefinitely indicated in both the antecedent and the consequent clause, this is often achieved merely by using the present tense of the verb, which in such a case however does not indicate the temporal present. This grammatical form is then the indefinite indicator in the main and subordinate clauses. An example of this is: 'When the Sun is in the tropic of Cancer, the longest day in the northern hemisphere occurs.' Here, also, it is impossible to express the sense of the subordinate clause in a full sentence, because this sense is not a complete thought. If we say: 'The Sun is in the tropic of Cancer,' this would refer to our present time and thereby change the sense. Neither is the sense of the main clause a thought; only the whole, composed of main and subordinate clauses, has such a sense. It may be added that several common components may be indefinitely indicated in the antecedent and consequent clauses.

It is clear that noun clauses with 'who' or 'what' and adverbial clauses with 'where,' 'when,' 'wherever,' 'whenever' are often to be interpreted as having the sense of antecedent clauses, e.g. 'who touches pitch, defiles himself.'

Adjective clauses can also take the place of conditional clauses. Thus the sense of the sentence previously used can be given in the form 'The square of a number which is less than 1 and greater than 0 is less than 1 and greater than 0.'

The situation is quite different if the common component of the two clauses is designated by a proper name. In the sentence:

> Napoleon, who recognized the danger to his right flank, himself led his guards against the enemy position

two thoughts are expressed:

> 1. Napoleon recognized the danger to his right flank
> 2. Napoleon himself led his guards against the enemy position.

When and where this happened is to be fixed only by the context, but is nevertheless to be taken as definitely determined thereby. If the entire sentence is uttered as an assertion, we thereby simultaneously assert both component sentences. If one of the parts is false, the whole is false. Here we have the case that the subordinate clause by itself has a complete thought as sense (if we complete it by indication of place and time). The meaning of the subordinate clause is accordingly a truth-value. We can therefore expect that it may be replaced, without harm to the truth-value of the whole, by a sentence having the same truth-value. This is indeed the case; but it is to be noticed that for purely grammatical reasons, its subject must be 'Napoleon,' for only then can it be brought into the form of an adjective clause attaching to 'Napoleon.' But if the demand that it be expressed in this form is waived, and the connexion shown by 'and,' this restriction disappears.

---

[17] [Frege] In the case of these sentences, various interpretations are easily possible. The sense of the sentence, "After Schleswig-Holstein was separated from Denmark, Prussia and Austria quarreled" can be rendered "After the separation of Schleswig-Holstein from Denmark, Prussia and Austria quarreled." In this version, it is surely sufficiently clear that the sense is not to be taken as having as a part the thought that Schleswig-Holstein was once separated from Denmark, but that this is the necessary presupposition in order for the expression "after the separation of Schleswig-Holstein from Denmark" to have any meaning at all. To be sure, our sentence can also be interpreted as saying that Schleswig-Holstein was once separated from Denmark. We then have a case which is to be considered later. In order to understand the difference more clearly, let us project ourselves into the mind of a Chinese who, having little knowledge of European history, believes it to be false that Schleswig-Holstein was ever separated from Denmark. He will take our sentence, in the first version, to be neither true nor false, but will deny it to have any meaning, on the ground that its subordinate clause lacks a meaning. This clause would only apparently determine a time. If he interpreted our sentence in the second way, however, he would find a thought expressed in it which he would take to be false, beside a part which would be without meaning for him.

[18] [Frege] At times there is no linguistically explicit indicator and one must be read off from the entire context.

Subsidiary clauses beginning with 'although' also express complete thoughts. This conjunction actually has no sense and does not change the sense of the clause but only illuminates it in a peculiar fashion.[19] We could indeed replace the concessive clause without harm to the truth of the whole by another of the same truth-value; but the light in which the clause is placed by the conjunction might then easily appear unsuitable, as if a song with a sad subject were to be sung in a lively fashion.

In the last cases the truth of the whole included the truth of the component clauses. The case is different if an antecedent clause expresses a complete thought by containing, in place of an indefinite indicator, a proper name or something which is to be regarded as equivalent. In the sentence

If the Sun has already risen, the sky is very cloudy

the time is the present, that is to say, definite. And the place is also to be thought of as definite. Here it can be said that a relation between the truth-values of antecedent and consequent clauses has been asserted, viz., that the case does not occur in which the antecedent means the True and the consequent the False. Accordingly, our sentence is true if the Sun has not yet risen, whether the sky is very cloudy or not, and also if the Sun has risen and the sky is very cloudy. Since only truth-values are here in question, each component clause can be replaced by another of the same truth-value without changing the truth-value of the whole. To be sure, the light in which the subject then appears would usually be unsuitable; the thought might easily seem distorted; but this has nothing to do with its truth-value. One must always observe that there are overtones of subsidiary thoughts, which are however not explicitly expressed and therefore should not be reckoned in the sense. Hence, also, no account need be taken of their truth-values.[20]

The simple cases have now been discussed. Let us review what we have learned.

The subordinate clause usually has for its sense not a thought, but only a part of one, and consequently no truth-value is being meant. The reason for this is either that the words in the subordinate clause have indirect meaning, so that the meaning, not the sense, of the subordinate clause is a thought; or else that, on account of the presence of an indefinite indicator, the subordinate clause is incomplete and expresses a thought only when combined with the main clause. It may happen, however, that the sense of the subsidiary clause is a complete thought, in which case it can be replaced by another of the same truth-value without harm to the truth of the whole—provided there are no grammatical obstacles.

An examination of all the subordinate clauses which one may encounter will soon provide some which do not fit well into these categories. The reason, so far as I can see, is that these subordinate clauses have no such simple sense. Almost always, it seems, we connect with the main thoughts expressed by us subsidiary thoughts which, although not expressed, are associated with our words, in accordance with psychological laws, by the hearer. And since the subsidiary thought appears to be connected with our words on its own account, almost like the main thought itself, we want it also to be expressed. The sense of the sentence is thereby enriched, and it may well happen that we have more simple thoughts than clauses. In many cases the sentence must be understood in this way, in others it may be doubtful whether the subsidiary thought belongs to the sense of the sentence or only accompanies it.[21] One might perhaps find that the sentence

> Napoleon, who recognized the danger to his right flank, himself led his guards against the enemy position

expresses not only the two thoughts shown above, but also the thought that the knowledge of the danger was the reason why he led the guards against the enemy position. One may in fact doubt whether this thought is just slightly suggested or really expressed. Let the question be considered whether our sentence is false if Napoleon's decision had already been made before he recognized the danger. If our sentence could be true in spite of this, the subsidiary thought should not be understood as part of the sense. One would probably decide in favour of this. The alternative would make for a quite complicated situation: We would have more simple thoughts than clauses. If the sentence

Napoleon recognized the danger to his right flank were now to be replaced by another having the same truth value, e.g.

---

[19] [Frege] Similarly in the case of "but," "yet."

[20] [Frege] The thought of our sentence might also be expressed thus: "Either the Sun has not risen yet or the sky is very cloudy"—which shows how this kind of sentence connexion is to be understood.

[21] [Frege] This may be important for the question whether an assertion is a lie, or an oath a perjury.

> Napoleon was already more than 45 years old

not only would our first thought be changed, but also our third one. Hence the truth-value of the latter might change—viz. if his age was not the reason for the decision to lead the guards against the enemy. This shows why clauses of equal truth-value cannot always be substituted for one another in such cases. The clause expresses more through its connexion with another than it does in isolation.

Let us now consider cases where this regularly happens. In the sentence:

> Bebel fancies that the return of Alsace-Lorraine would appease France's desire for revenge

two thoughts are expressed, which are not however shown by means of antecedent and consequent clauses, viz.:

> (1) Bebel believes that the return of Alsace-Lorraine would appease France's desire for revenge
> (2) the return of Alsace-Lorraine would not appease France's desire for revenge.

In the expression of the first thought, the words of the subordinate clause have their indirect meaning, while the same words have their customary meaning in the expression of the second thought. This shows that the subordinate clause in our original complex sentence is to be taken twice over, with different meanings: once for a thought, once for a truth-value. Since the truth-value is not the total meaning of the subordinate clause, we cannot simply replace the latter by another of equal truth-value. Similar considerations apply to expressions such as 'know,' 'discover,' 'it is known that.'

By means of a subordinate causal clause and the associated main clause we express several thoughts, which however do not correspond separately to the original clauses. In the sentence: 'Because ice is less dense than water, it floats on water' we have

> (1) Ice is less dense than water;
> (2) If anything is less dense than water, it floats on water;
> (3) Ice floats on water.

The third thought, however, need not be explicitly introduced, since it is contained in the remaining two. On the other hand, neither the first and third nor the second and third combined would furnish the sense of our sentence. It can now be seen that our subordinate clause

> because ice is less dense than water

expresses our first thought, as well as a part of our second. This is how it comes to pass that our subsidiary clause cannot be simply replaced by another of equal truth-value; for this would alter our second thought and thereby might well alter its truth-value.

The situation is similar in the sentence

> If iron were less dense than water, it would float on water.

Here we have the two thoughts that iron is not less dense than water, and that something floats on water if it is less dense than water. The subsidiary clause again expresses one thought and a part of the other.

If we interpret the sentence already considered

> After Schleswig-Holstein was separated from Denmark, Prussia and Austria quarrelled

in such a way that it expresses the thought that Schleswig-Holstein was once separated from Denmark, we have first this thought, and secondly the thought that, at a time more closely determined by the subordinate clause, Prussia and Austria quarrelled. Here also the subordinate clause expresses not only one thought but also a part of another. Therefore it may not in general be replaced by another of the same truth-value.

It is hard to exhaust all the possibilities given by language; but I hope to have brought to light at least the essential reasons why a subordinate clause may not always be replaced by another of equal truth-value without harm to the truth of the whole sentence structure. These reasons arise:

> (1) when the subordinate clause does not have a truth-value as its meaning, inasmuch as it expresses only a part of a thought;
> (2) when the subordinate clause does have a truth-value as its meaning but is not restricted to so doing, inasmuch as its sense includes one thought and part of another.

The first case arises:

> (a) for words having indirect meaning

(b) if a part of the sentence is only an indefinite indicator instead of a proper name.

In the second case, the subsidiary clause may have to be taken twice over, viz, once in its customary meaning, and the other time in indirect meaning; or the sense of a part of the subordinate clause may likewise be a component of another thought, which, taken together with the thought directly expressed by the subordinate clause, makes up the sense of the whole sentence.

It follows with sufficient probability from the foregoing that the cases where a subordinate clause is not replaceable by another of the same value cannot be brought in disproof of our view that a truth-value is the meaning of a sentence that has a thought as its sense.

Let us return to our starting point.

When we found '$a = a$' and '$a = b$' to have different cognitive values, the explanation is that for the purpose of knowledge, the sense of the sentence, viz., the thought expressed by it, is no less relevant than its meaning, i.e. its truth-value. If now $a = b$, then indeed what is meant by 'b' is the same as what is meant by 'a,' and hence the truth-value of '$a = b$' is the same as that of '$a = a$.' In spite of this, the sense of 'b' may differ from that of 'a,' and thereby the thought expressed in '$a = b$' differs from that of $a = a$.' In that case the two sentences do not have the same cognitive value. If we understand by 'judgment' the advance from the thought to its truth-value, as in the present paper, we can also say that the judgments are different.

Sigmund Freud

1856–1939

Trained as a neurologist, Sigmund Freud pursued the nascent field of psychiatry to become the chief architect and theorist of psychoanalysis. Throughout a turbulent career, which transformed modern thinking about human nature, Freud developed a complex theory of human psychology and sexuality that traced adult mental aberrations and neuroses to early childhood experiences and the more or less systematic repression of the inherently sexual nature of human psychic energy. From his earliest speculations to his more mature theories, a crucial element was the interpretation of dreams as the manifest expression of latent psychic content that may be oblique, disguised, or otherwise represented symbolically, as distressing, anxiety producing, or too painful to confront directly. His practice, relying upon case studies and doctor-patient analytical sessions, produced almost from the very beginning, dramatic narratives and sometimes shocking revelations, that were often followed by sharp critiques and allegations (which continued throughout his career)—having, ironically, the effect of confirming to Freud the essential correctness of his insights and methodology as they provided an explanation for attacks against him.

Central to Freud's theory of the psyche was his use of the figure of Oedipus and what came to be popularly known as the "Oedipus Complex" as a powerful and provocative model for explaining the emergence of the adult ego and the articulation of a dynamic tripartite psychological structure of the Id, the Ego, and the Superego, subject to a more general distinction between the unconscious and the conscious mind. The work of analysis depended upon the supposition that much that happens in mental life is not conscious, hypothetically because of the repression of traumatic events, and must be brought, for the purposes of therapy, to consciousness. What is particularly striking in retrospect is the extraordinary reliance in Freud's theorizing upon literary models, particularly Shakespeare and Sophocles (but not limited to these two), using literary narratives as a way to illuminate or recognize characteristic symptoms discerned in practice. The ambiguity that has fueled a great deal of recent debate is the "scientific" status of Freud's discoveries and proposed principles of explanation. Are the stories upon which Freud relied for the terms of his own theory the source, or just additional evidence for the perspicuity of Freud's analytical insights? The two selections are reprinted here, the first from an early letter to Fleiss, which offers the first glimpse of Freud's more mature theory; and the second, from *A General Introduction to Psychoanalysis,* which explores in detail the structure and the ramifications of the Oedipal complex.

The primary and critical literature on Freud and the Psychoanalytic movement (including later theorists such as C. G. Jung, Jacques Lacan, Karen Horney, Abram Maslow, and others) is vast and complex. The basic writings of Freud himself are available in many collections, but the current standard edition is James Strachey, ed., *The Edition of the Complete Psychological Works of Sigmund Freud* (in twenty-four volumes, 1966–1974). See also, his *Collected Papers* (in five volumes, 1924–1950) and Freud's *Autobiography,* tr. by James Strachey (1935). For readers with a clinical interest in Freud, *Abstracts of The Standard Edition of the Complete Psychological Works of Sigmund Freud,* edited by Carrie Lee Rothgeb (1971; 1975) is essential. Major recent studies include: Stephen A. Mitchell and Margaret J. Black, *Freud and Beyond: A History of Modern Psychoanalytic Thought* (1995); Todd Dufresne, ed., *Returns of the "French Freud": Freud, Lacan, and Beyond* (1997); Jacques Derrida, *Resistances of Psychoanalysis* (1998); Laura Marcus, ed., *Sigmund Freud's Interpretation of Dreams: New Interdisciplinary Essays* (1999); Leonard Jackson, *Literature, Psychoanalysis, and the New Sciences of Mind* (2000); Edward Said, *Freud and the Non-European* (2003).

from

Letter to Wilhelm Fleiss, October 15, 1897

. . . My self-analysis is in fact the most essential thing I have at present and promises to become of the greatest value to me if it reaches its end. In the middle of it, it suddenly ceased for three days, during which I had the feeling of being tied up inside (which patients complain of so much), and I was really disconsolate until I found that these same three days (twenty-eight days ago) were the bearers of identical somatic phenomena. Actually only two bad days with a remission in between. From this one should draw the conclusion that the female period is not conducive to work. Punctually on the fourth day, it started again. Naturally, the pause also had another determinant—the resistance to something surprisingly new. Since then I have been once again intensely preoccupied [with it], mentally fresh, though afflicted with all sorts of minor disturbances that come from the content of the analysis.

My practice, uncannily, still leaves me a great deal of free time. The whole thing is all the more valuable for my purposes, since I have succeeded in finding a few real points of reference for the story. I asked my mother whether she still remembered the nurse. "Of course," she said, "an elderly person, very clever, she was always carrying you off to some church; when you returned home you preached and told us all about God Almighty. During my confinement with Anna (two and a half years younger), it was discovered that she was a thief, and all the shiny new kreuzers and zehners[1] and all the toys that had been given to you were found in her possession. Your brother Philipp himself fetched the policeman; she then was given ten months in prison." Now look at how this confirms the conclusions of my dream interpretation. It was easy for me to explain the only possible mistake. I wrote to you that she induced me to steal zehners and give them to her. In truth, the dream meant that she stole them herself. For the dream picture was a memory of my taking money from the mother of a doctor—that is, wrongfully. The correct interpretation is: I = she, and the mother of the doctor equals my mother. So far was I from knowing she was a thief that I made a wrong interpretation.

I also inquired about the doctor we had had in Freiberg because one dream concentrated a good deal of resentment on him. In the analysis of the dream figure behind which he was concealed, I also thought of a Professor von Kraus, my history teacher in high school. He did not seem to fit in at all, because my relationship with him was indifferent or even comfortable. My mother then told me that the doctor in my childhood had only one eye, and of all my teachers Professor Kraus was the only one with the same defect! The conclusive force of these coincidences might be weakened by the objection that on some occasion in my later childhood, I had heard that the nurse was a thief and then apparently had forgotten it until it finally emerged in the dream. I myself believe that that is so. But I have another, entirely irrefutable and amusing proof. I said to myself that if the old woman disappeared from my life so suddenly, it must be possible to demonstrate the impression this made on me. Where is it then? Thereupon a scene occurred to me which in the course of twenty-five years has occasionally emerged in my conscious memory without my understanding it. My mother was nowhere to be found; I was crying in despair. My brother Philipp (twenty years older than I) unlocked a wardrobe [*Kasten*] for me, and when I did not find my mother inside it either, I cried even more until, slender and beautiful, she came in through the door. What can this mean? Why did my brother unlock the wardrobe for me,

---

Freud's Letter to Wilhelm Fleiss, October 15, 1897, is reprinted from *The Complete Letters of Sigmund Freud to Wilhelm Fleiss, 1887–1904,* edited and translated by Jeffrey M. Masson (Cambridge, Mass.: Harvard University Press, 1985), 269–73.

[1] *Kreuzer* and *zehner* are designations of coins.

knowing that my mother was not in it and that thereby he could not calm me down? Now I suddenly understand it. I had asked him to do it. When I missed my mother, I was afraid she had vanished from me, just as the old woman had a short time before. So I must have heard that the old woman had been locked up and therefore must have believed that my mother had been locked up too—or rather, had been "boxed up" [*eingekastelt*]—for my brother Philipp, who is now sixty-three years old, to this very day is still fond of using such puns. The fact that I turned to him in particular proves that I was well aware of his share in the disappearance of the nurse.

Since then I have got much further, but have not yet reached my real point of rest. It is so difficult and would carry us so far afield to communicate what I have not yet finished that I hope you will excuse me from it and content yourself with the knowledge of those elements that are certain. If the analysis fulfills what I expect of it, I shall work on it systematically and then put it before you. So far I have found nothing completely new, [just] all the complications to which I have become accustomed. It is by no means easy. Being totally honest with oneself is a good exercise. A single idea of general value dawned on me. I have found, in my own case too, [the phenomenon of] being in love with my mother and jealous of my father, and I now consider it a universal event in early childhood, even if not so early as in children who have been made hysterical. (Similar to the invention of parentage [family romance][2] in paranoia-heroes, founders of religion). If this is so, we can understand the gripping power of *Oedipus Rex,* in spite of all the objections that reason raises against the presupposition of fate; and we can understand why the later "drama of fate" was bound to fail so miserably. Our feelings rise against any arbitrary individual compulsion, such as is presupposed in *Die Ahnfrau*[3] and the like; but the Greek legend seizes upon a compulsion which everyone recognizes because he senses its existence within himself. Everyone in the audience was once a budding Oedipus in fantasy and each recoils in horror from the dream fulfillment here transplanted into reality, with the full quantity of repression which separates his infantile state from his present one.

Fleetingly the thought passed through my head that the same thing might be at the bottom of *Hamlet* as well. I am not thinking of Shakespeare's conscious intention, but believe, rather, that a real event stimulated the poet in his representation, in that his unconscious understood the unconscious of his hero. How does Hamlet the hysteric justify his words, "Thus conscience does make cowards of us all?" How does he explain his irresolution in avenging his father by the murder of his uncle—the same man who sends his courtiers to their death without a scruple and who is positively precipitate in murdering Laertes? How better than through the torment he suffers from the obscure memory that he himself had contemplated the same deed against his father out of passion for his mother, and—"use every man after his desert, and who should 'scape whipping?'" His conscience is his unconscious sense of guilt. And is not his sexual alienation in his conversation with Ophelia typically hysterical? And his rejection of the instinct that seeks to beget children? And, finally, his transferral of the deed from his own father to Ophelia's? And does he not in the end, in the same marvelous way as my hysterical patients, bring down punishment on himself by suffering the same fate as his father of being poisoned by the same rival?

I have kept my interest focused so exclusively on the analysis that I have not yet even attempted to try out, instead of my hypothesis that in every instance repression starts from the feminine aspect and is directed against the male one, the opposite hypothesis proposed by you. I shall, however, tackle it sometime. Unfortunately, I barely participate in your work and progress. In this one respect I am better off than you are. What I can tell you about mental frontiers [*Seelenende*] of this world finds in you an understanding critic, and what you can tell me about its celestial frontiers [*Sternenende*] evokes only unproductive amazement in me.

Thirteenth Lecture: Archaic and Infantile Features in Dreams

[In the early pages of this lecture, Freud returns to his hypothesis concerning the "dream-work," that under the influence of censorship, the "latent content" is translated into another form. The manifest content in the dream may therefore belong to phases in intellectual development long since outgrown. This Freud designates as the *"archaic"* or *"regressive"* expression of the dream-work, and the task of dream interpretation for the analyst thus arises from what he calls "the peculiar *amnesia of childhood*" in which much of early childhood is forgotten, conjoined with the peculiar survival of selected concrete images or *"screen-memories."* The particular phenomenon to which he turns attention is the manifestation of apparent death wishes in dreams.]

---

[2] This refers to Freud's designation for the common fantasy of a child that he or she is really the offspring of other parents, typically more noble and attractive.

[3] *Die Anfrau* (The Ancesstress) is a tragedy by Austrian author Franz Grillparzer (1791–1872), published in 1817. The play could be taken as a "tragedy of fate" *(Schicksalsdrama),* in the sense Freud here suggests, though Grillparzer's characters are ultimately responsible for their own fates.

From THIRTEENTH LECTURE: ARCHAIC AND INFANTILE FEATURES IN DREAMS, which was first presented in a series of lectures in Vienna, 1915–1917; first published in 1920, revised edition, 1935. Reprinted from *A General Introduction to Psychoanalysis,* authorized English translation of the revised edition by Joan Riviere (New York: Liveright Publishing Corporation, 1935).

* * *

Let us keep to the death-wishes, which we shall certainly find mostly derived from the unbounded egoism of the dreamer. Wishes of this sort are very often found to be the underlying agents of dreams. Whenever anyone gets in our way in life—and how often must this happen when our relations to one another are so complicated!—a dream is immediately prepared to make away with that person, even if it be father, mother, brother or sister, husband or wife. It appeared to us amazing that such wickedness should be innate in humanity, and certainly we were not inclined to admit without further evidence that this result of our interpretation of dreams was correct. But, when once we had seen that the origin of wishes of this sort must be looked for in the past, we had little difficulty in finding the period in the past of the individual in which there is nothing strange in such egoism and such wishes, even when directed against the nearest and dearest. A child in his earliest years (which later are veiled in oblivion) is just the person who frequently displays such egoism in boldest relief; invariably, unmistakable tendencies of this kind, or, more accurately, surviving traces of them, are plainly visible in him. For a child loves himself first and only later learns to love others and to sacrifice something of his own ego to them. Even the people whom he seems to love from the outset are loved in the first instance because he needs them and cannot do without them—again therefore, from motives of egoism. Only later does the impulse of love detach itself from egoism: it is a literal fact that the child learns how to love through his own egoism.

In this connection it will be instructive to compare a child's attitude towards his brothers and sisters with his attitude towards his parents. The little child does not necessarily love his brothers and sisters, and often he is quite frank about it. It is unquestionable that in them he sees and hates his rivals, and it is well known how commonly this attitude persists without interruption for many years, till the child reaches maturity and even later. Of course it often gives place to a more tender feeling, or perhaps we should say it is overlaid by this, but the hostile attitude seems very generally to be the earlier. We can most easily observe it in children of two and a half to four years old when a new baby arrives, which generally meets with a very unfriendly reception; remarks such as "I don't like it. The stork is to take it away again" are very common. Subsequently every opportunity is seized to disparage the new-comer; attempts are even made to injure it and actual attacks upon it are by no means unheard-of. If the difference in age is less, by the time the child's mental activity is more fully developed the rival is already in existence and he adapts himself to the situation; if on the other hand there is a greater difference between their ages, the new baby may rouse certain kindly feelings from the first, as an object of interest, a sort of living doll; and when there is as much as eight years or more between them, especially if the elder child is a girl, protective, motherly impulses may at once come into play. But, speaking honestly, when we find a wish for the death of a brother or a sister latent in a dream we need seldom be puzzled, for we find its origin in early childhood without much trouble, or indeed, quite often in the later years when they still lived together.

There is probably no nursery without violent conflicts between the inhabitants, actuated by rivalry for the love of the parents, competition for possessions shared by them all, even for the actual space in the room they occupy. Such hostility is directed against older as well as younger brothers and sisters. I think it was Bernard Shaw[4] who said: "If there is anyone whom a young English lady hates more than her mother it is her elder sister." Now there is something in this dictum which jars upon us; it is hard enough to bring ourselves to understand hatred and rivalry between brothers and sisters, but how can feelings of hate force themselves into the relation between mother and daughter, parents and children?

This relationship is no doubt a more-favourable one, also from the children's point of view; and this too is what our expectations require: we find it far more offensive for love to be lacking between parents and children than between brothers and sisters. We have, so to speak, sanctified the former love while allowing the latter to remain profane. Yet everyday observation may show us how frequently the sentiments entertained towards each other by parents and grown-up children fall short of the ideal set up by society, and how much hostility lies smouldering, ready to burst into flame if it were not stifled by considerations of filial or parental duty and by other, tender impulses. The motives for this hostility are well known, and we recognize a tendency for those of the same sex to become alienated, daughter from mother and father from son. The daughter sees in her mother the authority which imposes limits to her will, whose task it is to bring her to that renunciation of sexual freedom which society demands; in certain cases, too, the mother is still a rival, who objects to being set aside. The same thing is repeated still more blatantly between father and son. To the son the father is the embodiment of the social compulsion to which he so unwillingly submits, the person who stands in the way of his following his own will, of his early sexual pleasures and, when there is family property, of his enjoyment of it. When a throne is involved this impatience for the death of the father may approach tragic intensity. The relation between father and daughter or mother and son would seem less liable to disaster; the latter relation furnishes the purest examples of unchanging tenderness, undisturbed by any egoistic consideration.

---

[4] George Bernard Shaw (1856–1950), Irish dramatist and writer.

Why, you ask, do I speak of things so banal and so well known to everybody? Because there exists an unmistakable tendency in people's minds to deny the significance of these things in real life and to pretend that the social ideal is much more frequently realized than it actually is. But it is better that psychology should tell the truth than that it should be left to cynics to do so. This general denial is only applied to real life, it is true; for fiction and drama are free to make use of the motives laid bare when these ideals are rudely disturbed.

There is nothing to wonder at therefore if the dreams of a great number of people bring to light the wish for the removal of their parents, especially of the parent whose sex is the same as the dreamer's. We may assume that the wish exists in waking life as well, sometimes even in consciousness if it can disguise itself behind another motive, as the dreamer in our third example disguised his real thought by pity for his father's useless suffering. It is but rarely that hostility reigns alone,—far more often it yields to more tender feelings which finally suppress it, when it has to wait in abeyance till a dream shows it, as it were, in isolation. That which the dream shows in a form magnified by this very isolation resumes its true proportions when our interpretation has assigned to it its proper place in relation to the rest of the dreamer's life. (H. Sachs.)[5] But we also find this death-wish where there is no basis for it in real life and where the adult would never have to confess to entertaining it in his waking life. The reason for this is that the deepest and most common motive for estrangement, especially between parent and child of the same sex, came into play in the earliest years of childhood.

I refer to that rivalry of affections in which sexual elements are plainly emphasized. The son, when quite a little child, already begins to develop a peculiar tenderness towards his mother, whom he looks upon as his own property, regarding his father in the light of a rival who disputes this sole possession of his; similarly the little daughter sees in her mother someone who disturbs her tender relation to her father and occupies a place which she feels she herself could very well fill. Observation shows us how far back these sentiments date, sentiments which we describe by the term *Oedipus complex*, because in the Oedipus myth the two extreme forms of the wishes arising from the situation of the son—the wish to kill the father and to marry the mother—are realized in an only slightly modified form. I do not assert that the Oedipus complex exhausts all the possible relations which may exist between parents and children; these relations may well be a great deal more complicated. Again, this complex may be more or less strongly developed, or it may even become inverted, but it is a regular and very important factor in the mental life of the child; we are more in danger of underestimating than of overestimating its influence and that of the developments which may follow from it. Moreover, the parents themselves frequently stimulate the children to react with an Oedipus complex, for parents are often guided in their preferences by the difference in sex of their children, so that the father favours the daughter and the mother the son; or else, where conjugal love has grown cold, the child may be taken as a substitute for the love-object which has ceased to attract.

It cannot be said that the world has shown great gratitude to psychoanalytic research for the discovery of the Oedipus complex; on the contrary, the idea has excited the most violent opposition in grown-up people; and those who omitted to join in denying the existence of sentiments so universally reprehended and tabooed have later made up for this by proffering interpretations so wide of the mark as to rob the complex of its value. My own unchanged conviction is that there is nothing in it to deny or to gloss over. We ought to reconcile ourselves to facts in which the Greek myth itself saw the hand of inexorable destiny. Again, it is interesting to find that the Oedipus complex, repudiated in actual life and relegated to fiction, has there come to its own. O. Rank[6] in a careful study of this theme has shown how this very complex has supplied dramatic poetry with an abundance of motives in countless variations, modifications, and disguises, in short, subject to just the distortion familiar to us in the work of the dream-censorship. So we may look for the Oedipus complex even in those dreamers who have been fortunate enough to escape conflicts with their parents in later life; and closely connected with this we shall find what is termed the *castration complex,* the reaction to that intimidation in the field of sex or to that restraint of early infantile sexual activity which is ascribed to the father.

[5] Hanns Sachs (1881–1947), Austrian psychoanalyst and editor, with Otto Rank, of *Imago*, one of the premier journals of the psychoanalytic movement, from 1912 to 1937.

[6] Otto Rank (1884–1939), Austrian psychoanalyst. Freud refers to *Inzest Motiv in Dichtung und Sage* (*The Incest Theme in Literature and Legend*, translation published 1992).

What we have already ascertained has guided us to the study of the child's mental life, and we may now hope to find in a similar way an explanation of the source of the other kind of prohibited wishes in dreams, i.e. the excessive sexual desires. We are impelled therefore to study the development of the sexual life of the child, and here from various sources we learn the following facts. In the first place, it is an untenable fallacy to suppose that the child has no sexual life and to assume that sexuality first makes its appearance at puberty, when the genital organs come to maturity. On the contrary he has from the very beginning a sexual life rich in content, thought it differs in many points from that which later is regarded as normal. What in adult life are termed "perversions" depart from the normal in the following respects: (1) in a disregard for the barriers of species (the gulf between man and beast), (2) in the insensibility to barriers imposed by disgust, (3) in the transgression of the incest-barrier (the prohibition against seeking sexual gratification with close blood-relations), (4) in homosexuality and, (5) in the transferring of the part played by the genital organs to other organs and different areas of the body. All these barriers are not in existence from the outset, but are only gradually built up in the course of development and education. The little child is free from them: he does not perceive any immense gulf between man and beast, the arrogance with which man separates himself from the other animals only dawns in him at a later period. He shows at the beginning of life no disgust for excrement, but only learns this feeling slowly under the influence of education; he attaches no particular importance to the difference between the sexes, in fact he thinks that both have the same formation of the genital organs; he directs his earliest sexual desires and his curiosity to those, nearest to him or to those, who for other reasons are specially beloved—his parents, brothers and sisters or nurses; and finally we see in him a characteristic which manifests itself again later at the height of some love-relationship—namely, he does not look for gratification in the sexual organs only, but discovers that many other parts of the body possess the same sort of sensibility and can yield analogous pleasurable sensations, playing thereby the part of genital organs. The child may be said then to be *polymorphously perverse,* and even if mere traces of all these impulses are found in him; this is due on the one hand to their lesser intensity as compared with that which they assume in later life and, on the other hand, to the fact that education immediately and energetically suppresses all sexual manifestations in the child. This suppression may be said to be embodied in a theory; for grown-up people endeavour to over look some of these manifestations, and, by misinterpretation, to rob others of their sexual nature, until in the end the whole thing can be altogether denied. It is often the same people who first inveigh against the sexual "naughtiness" of children in the nursery and then sit down to their writing-tables to defend the sexual purity of the same children. When they are left to themselves or when they are seduced children often display perverse sexual activity to a really remarkable extent. Of course grown-up people are right in not taking this too seriously and in regarding it, as they say, as "childish tricks" and "play," for the child cannot be judged either by a moral or legal code as if he were mature and fully responsible; nevertheless these things do exist, and they have their significance both as evidence of innate constitutional tendencies and inasmuch much as they cause and foster later developments: they give us an insight into the child's sexual life and so into that of humanity as a whole. If then we find all these perverse wishes behind the distortions of our dreams, it only means that dreams in *this respect also* have regressed completely to the infantile condition.

Amongst these forbidden wishes special prominence must still be given to the incestuous desires, i.e. those directed towards sexual intercourse with parents or brothers and sisters. You know in what abhorrence human society holds, or at least professes to hold, such intercourse, and what emphasis is laid upon the prohibitions of it. The most preposterous attempts have been made to account for this horror of incest: some people have assumed that it is a provision of nature for the preservation of the species, manifesting itself in the mind by these prohibitions because in-breeding would result in racial degeneration; others have asserted that propinquity from early childhood has deflected sexual desire from the persons concerned. In both these cases, however, the avoidance of incest would have been automatically secured and we should be at a loss to understand the necessity for stern prohibitions, which would seem rather to point to a strong desire. Psychoanalytic investigations have shown beyond the possibility of doubt, that an *incestuous love-choice* is in fact the first and the regular one, and that it is only later that any opposition is manifested towards it, the causes of which are not to be sought in the psychology of the individual.

Let us sum up the results which our excursions into child psychology have brought to the understanding of dreams. We have learnt not only that the material of the forgotten childish experiences is accessible to the dream, but also that the child's mental life, with all its peculiarities, its egoism, its incestuous object-choice, persists in it and therefore in the unconscious, and that our dreams take us back every night to this infantile stage. This corroborates the belief that *the Unconscious is the infantile mental life,* and, with this, the objectionable impression that so much evil lurks in human nature grows somewhat less. For this terrible evil is simply what is original, primitive and infantile in mental life, what we find in operation in the child, but in part overlook in him because it is on so small a scale, and in part do not take greatly to heart because we do not demand a high ethical standard in a child. By regressing to this infantile stage our dreams appear to have brought the evil in us to light, but the appearance is deceptive, though we have let ourselves be dismayed by it; we are not so evil as the interpretation of our dreams would lead us to suppose.

If the evil impulses of our dreams are merely infantile, a reversion to the beginnings of our ethical development, the dream simply making us children again in thought and feeling, it is surely not reasonable to be ashamed of these evil dreams. But the reasoning faculty is only part of our mental life; there is much in it besides which is not reasonable, and so it happens that, although it is unreasonable, we nevertheless are ashamed of such dreams. We subject them to the dream-censorship and are ashamed and indignant when one of these wishes by way of exception penetrates our consciousness in a form so undisguised that we cannot fail to recognize it; yes, we even at times feel just as much ashamed of a distorted dream as if we really understood it. Just think of the outraged comment of the respectable elderly lady upon her dream about "love service," although it was not interpreted to her. So the problem is not yet solved, and it is still possible that if we pursue this question of the evil in dreams we may arrive at another conclusion and another estimate of human nature.

Our whole enquiry has led to two results which, however, merely indicate the beginning of new problems and new doubts. In the first place: the regression in dreams is one not only of form but of substance. Not only does it translate our thoughts into a primitive form of expression, but it also reawakens the peculiarities of our primitive mental life—the old supremacy of the ego, the initial impulses of our sexual life, even restores to us our old intellectual possession if we may conceive of symbolism in this way. And secondly: all these old infantile characteristics, which were once dominant and solely dominant, must to-day be accounted to the unconscious and must alter and extend our views about it. "Unconscious" is no longer a term for what is temporarily latent: the unconscious is a special realm, with its own desires and modes of expression and peculiar mental mechanisms not elsewhere operative. Yet the latent dream-thoughts disclosed by our interpretation do not belong to this realm; rather they correspond to the kind of thoughts we have in waking life also. And yet they are unconscious: how is the paradox to be resolved? We begin to realize that here we must discriminate. Something which has its origin in our conscious life and shares its characteristics—we call it the "residue" from the previous day—meets together with something from the realm of the unconscious in the formation of a dream, and it is between these two regions that the dream-work is accomplished. The influence of the unconscious impinging upon this residue probably constitutes the condition for regression. This is the deepest insight into the nature of dreams possible to us until we have explored further fields in the mind; but soon it will be time to give another name to the unconscious character of the latent dream-thoughts, in order to distinguish it from that unconscious material which has its origin in the province of the infantile.

We can of course also ask: What is it that forces our mental activity during sleep to such regression? Why cannot the mental stimuli that disturb sleep be dealt with without it? And if on account of the dream-censorship the mental activity has to disguise itself in the old, and now incomprehensible, form of expression, what is the object of re-animating the old impulses, desires and characteristics, now surmounted, what, in short, is the use of *regression in substance* as well as in *form?* The only satisfactory answer would be that this is the one possible way in which dreams can be formed, that, dynamically considered, the relief from the stimulus giving rise to the dream cannot otherwise be accomplished. But this is an answer for which, at present, we have no justification.

Lecture Twenty-One: Development of the Libido and Sexual Organization

[Freud begins this lecture with a return to the subject of perversions and its importance for his theory of sexuality, with particular emphasis upon infantile sexuality, espe-

---

From TWENTY-FIRST LECTURE: DEVELOPMENT OF THE LIBIDO AND SEXUAL ORGANIZATION, which was first given in a series of lectures in Vienna, 1915–1917, and first published in 1920, revised edition, 1935. Reprinted from *A General Introduction to Psychoanalysis,* authorized English translation of the revised edition by Joan Riviere (New York: Liveright Publishing Corporation, 1935).

cially as children seek "gratification in the genital organs." He introduces the idea of a *"latency period"* that may be absent, but usually appears from about the sixth to the eighth year, though the period of "greatest interest" for *"libido-development"* comes earlier, usually before the third year. The rapid development of the libido in early childhood carries forward, from an early *"oral* phase" to a period of *"genital organization"* which subordinates the *"libido-function"* to *"the primacy of the genital zone."*]

* * *

To-day we will follow up another aspect of this development—namely, the relation of the sexual component-impulses to an *object;* or, rather, we will take a fleeting glimpse over this development so that we may spend more time upon a comparatively late result of it. Certain of the component-impulses of the sexual instinct have an object from the very beginning and hold fast to it: such are the impulses to mastery (sadism), to gazing (skoptophilia) and curiosity. Others, more plainly connected with particular erotogenic areas in the body, only have an object in the beginning, so long as they are still dependent upon the non-sexual functions, and give it up when they become detached from these later. Thus the first object of the oral component of the sexual instinct is the mother's breast which satisfies the infant's need for nutrition. In the act of sucking for its own sake the erotic component, also gratified in sucking for nutrition, makes itself independent, gives up the object in an external person, and replaces it by a part of the child's own person. The oral impulse becomes *auto-erotic,* as the anal and other erotogenic impulses are from the beginning. Further development has, to put it as concisely as possible, two aims: first, to renounce auto-erotism, to give up again the object found in the child's own body in exchange again for an external one; and secondly, to combine the various objects of the separate impulses and replace them by one single one. This naturally can only be done if the single object is again itself complete, with a body like that of the subject; nor can it be accomplished without some part of the auto-erotic impulse-excitations being abandoned as useless.

The processes by which an object is found are rather involved, and have not so far received comprehensive exposition. For our purposes, it may be emphasized that, when the process has reached a certain point in the years of childhood before the latency period, the object adopted proves almost identical with the first object of the oral pleasure impulse, adopted by reason of the child's dependent relationship to it; it is, namely, the mother, although not the mother's breast. We call the mother the first *love*-object. We speak of 'love' when we lay the accent upon the mental side of the sexual impulses and disregard, or wish to forget for a moment, the demands of the fundamental physical or 'sensual' side of the impulses. At about the time when the mother becomes the love-object, the mental operation of repression has already begun in the child and has withdrawn from him the knowledge of some part of his sexual aims. Now with this choice of the mother as love-object is connected all that which, under the name of *'the Oedipus complex,'* has become of such great importance in the psychoanalytic explanation of the neuroses and which has had a perhaps equally important share in causing the opposition against psychoanalysis.

Here is a little incident which occurred during the present war.[7] One of the staunch adherents of psychoanalysis was stationed in his medical capacity on the German front in Poland; he attracted the attention of his colleagues by the fact that he occasionally effected an unexpected influence upon a patient. On being questioned, he admitted that he worked with psychoanalytic methods and with readiness agreed to impart his knowledge to his colleagues. So every evening the medical men of the corps, his colleagues and superiors, met to be initiated into the mysteries of psychoanalysis. For a time all went well; but when he had introduced his audience to the Oedipus complex a superior officer rose and announced that he did not believe this, it was the behaviour of a cad for the lecturer to relate such things to brave men, fathers of families who were fighting for their country, and he forbade the continuation of the lectures. This was the end; the analyst got himself transferred to another part of the front. In my opinion however, it is a bad outlook if a victory for German arms depends upon an 'organization' of science such as this, and German science will not prosper under any such organization.

Now you will be impatiently waiting to hear what this terrible Oedipus complex comprises. The name tells you: you all know the Greek myth of King Oedipus; whose destiny it was to slay his father and to wed his mother, who did all in his power to avoid the fate prophesied by the oracle, and who in self-punishment blinded himself when he discovered that in ignorance he had committed both these crimes. I trust that many of you have yourselves experienced the profound effect of the tragic drama fashioned by Sophocles from this story. The Attic poet's work portrays the gradual discovery of the deed of Oedipus, long since accomplished, and brings it slowly to light by skilfully prolonged enquiry, constantly fed by new evidence; it has thus a certain resemblance to the course of a psychoanalysis. In the dialogue the deluded mother-wife, Jocasta, resists the continuation of the enquiry; she points out that many people in their dreams have mated with their mothers, but that dreams are of no account. To us dreams are of much account, especially typical dreams which occur in many people; we have no doubt that the dream Jocasta speaks of is intimately related to the shocking and terrible story of the myth.

---

[7] That is, World War I.

It is surprising that Sophocles' tragedy does not call forth indignant remonstrance in its audience; this reaction would be much better justified in them than it was in the blunt army doctor. For at bottom it is an immoral play; it sets aside the individual's responsibility to social law, and displays divine forces ordaining the crime and rendering powerless the moral instincts of the human being which would guard him against the crime. It would be easy to believe that an accusation against destiny and the gods was intended in the story of the myth; in the hands of the critical Euripides, at variance with the gods, it would probably have become such an accusation. But with the reverent Sophocles there is no question of such an intention; the pious subtlety which declares it the highest morality to bow to the will of the gods, even when they ordain a crime, helps him out of the difficulty. I do not believe that this moral is one of the virtues of the drama, but neither does it detract from its effect; it leaves the hearer indifferent; he does not react to this, but to the secret meaning and content of the myth itself. He reacts as though by self-analysis he had detected the Oedipus complex in himself, and had recognized the will of the gods and the oracle as glorified disguises of his own unconscious; as though he remembered in himself the wish to do away with his father and in his place to wed his mother, and must abhor the thought. The poet's words seem to him to mean: "In vain do you deny that you are accountable, in vain do you proclaim how you have striven against these evil designs. You are guilty, nevertheless; for you could not stifle them; they still survive unconsciously in you." And psychological truth is contained in this; even though man has repressed his evil desires into his Unconscious and would then gladly say to himself that he is no longer answerable for them, he is yet compelled to feel his responsibility in the form of a sense of guilt for which he can discern no foundation.

There is no possible doubt that one of the most important sources of the sense of guilt which so often torments neurotic people is to be found in the Oedipus complex. More than this: in 1913, under the title of *Totem and Tabu,* I published a study of the earliest forms of religion and morality in which I expressed a suspicion that perhaps the sense of guilt of man kind as a whole, which is the ultimate source of religion and morality, was acquired in the beginnings of history through the Oedipus complex. I should much like to tell you more of this, but I had better not; it is difficult to leave this subject when once one begins upon it, and we must return to individual psychology.

Now what does direct observation of children, at the period of object-choice before the latency period, show us in regard to the Oedipus complex? Well, it is easy to see that the little man wants his mother all to himself, finds his father in the way, becomes restive when the latter takes upon himself to caress her, and shows his satisfaction when the father goes away or is absent. He often expresses his feelings directly in words and promises his mother to marry her; this may not seem much in comparison with the deeds of Oedipus, but it is enough in fact; the kernel of each is the same. Observation is often rendered puzzling by the circumstance that the same child on other occasions at this period will display great affection for the father; but such contrasting—or, better, *ambivalent*—states of feeling, which in adults would lead to conflicts, can be tolerated alongside one another in the child for a long time, just as later on they dwell together permanently in the unconscious. One might try to object that the little boy's behaviour is due to egoistic motives and does not justify the conception of an erotic complex; the mother looks after all the child's needs and consequently it is to the child's interest that she should trouble herself about no one else. This too is quite correct; but it is soon clear that in this, as in similar dependent situations, egoistic interests only provide the occasion on which the erotic impulses seize. When the little boy shows the most open sexual curiosity about his mother, wants to sleep with her at night, insists on being in the room while she is dressing, or even attempts physical acts of seduction, as the mother so often observes and laughingly relates, the erotic nature of this attachment to her is established without a doubt. Moreover, it should not be forgotten that a mother looks after a little daughter's needs in the same way without producing this effect; and that often enough a father eagerly vies with her in trouble for the boy without succeeding in winning the same importance in his eyes as the mother. In short, the factor of sex preference is not to be eliminated from the situation by any criticisms. From the point of view of the boy's egoistic interests it would merely be foolish if he did not tolerate two people in his service rather than only one of them.

As you see, I have only described the relationship of a boy to his father and mother; things proceed in just the same way, with the necessary reversal, in little girls. The loving devotion to the father, the need to do away with the superfluous mother and to take her place, the early display of coquetry and the arts of later womanhood, make up a particularly charming picture in a little girl, and may cause us to forget its seriousness and the grave consequences which may later result from this situation. Let us not fail to add that frequently the parents themselves exert a decisive influence upon the awakening of the Oedipus complex in a child, by themselves following the sex attraction where there is more than one child; the father in an unmistakable manner prefers his little daughter with marks of tenderness, and the mother, the son; but even this factor does not seriously impugn the spontaneous nature of the infantile Oedipus complex. When other children appear, the Oedipus complex expands and becomes a family complex. Reinforced anew by the injury resulting to the egoistic interests, it actuates a feeling of aversion towards these new arrivals and an unhesitating wish to get rid of them again. These feelings of hatred are as a rule much more often openly expressed than those connected with the parental complex. If such a wish is fulfilled and after a short time death removes the unwanted addition to the family, later analysis can show what a significant event this death is for the child, although it does not necessarily remain in memory. Forced into the second place by the birth of another child and for the first time almost entirely parted from the mother, the child finds it very hard to forgive her for this exclusion of him; feelings which in adults we should describe as profound embitterment are roused in him, and often become the ground-work of a lasting estrangement. That sexual curiosity and all its consequences is usually connected with these experiences has already been mentioned. As these new brothers and sisters grow up the child's attitude to them undergoes the most important transformations. A boy may take his sister as love-object in place of his faithless mother; where there are several brothers to win the favour of a little sister hostile rivalry, of great importance in after life, shows itself already in the nursery. A little girl takes an older brother as a substitute for the father who no longer treats her with the same tenderness as in her earliest years; or she takes a little sister as a substitute for the child that she vainly wished for from her father.

So much and a great deal more of a similar kind is shown by direct observation of children, and by consideration of clear memories of childhood, uninfluenced by any analysis. Among other things you will infer from this that a child's position in the sequence of brothers and sisters is of very great significance for the course of his later life, a factor to be considered in every biography. What is even more important, however, is that in the face of these enlightening considerations, so easily to be obtained, you will hardly recall without smiling the scientific theories accounting for the prohibition of incest. What has not been invented for this purposes! We are told that sexual attraction is diverted from the members of the opposite sex in one family owing to their living together from early childhood; or that a biological tendency against inbreeding has a mental equivalent in the horror of incests! Whereby it is entirely overlooked that no such rigorous prohibitions in law and custom would be required if any trustworthy natural barriers against the temptation to incest existed. The opposite is the truth. The first choice of object in mankind is regularly an incestuous one, directed to the mother and sister of men, and the most stringent prohibitions are required to prevent this sustained infantile tendency from being carried into effect. In the savage and primitive peoples surviving to-day the incest prohibitions are a great deal stricter than with us; Theodor Reik[8] has recently shown in a brilliant work that the meaning of the savage rites of puberty which represent re-birth is the loosening of the boy's incestuous attachment to the mother and his reconciliation with the father.

Mythology will show you that incest, ostensibly so much abhorred by men, is permitted to their gods without a thought; and from ancient history you may learn that incestuous marriage with a sister was prescribed as a sacred duty for kings (the Pharaohs of Egypt and the Incas of Peru); it was therefore in the nature of a privilege denied to the common herd.

Incest with the mother is one of the crimes of Oedipus and parricide the other. Incidentally, these are the two great offences condemned by totemism, the first social-religious institution of mankind. Now let us turn from the direct observation of children to the analytic investigation of adults who have become neurotic; what does analysis yield in further knowledge of the Oedipus complex? Well, this is soon told. The complex is revealed just as the myth relates it; it will be seen that every one of these neurotics was himself an Oedipus or, what amounts to the same thing, has become a Hamlet in his reaction to the complex. To be sure, the analytic picture of the Oedipus complex is an enlarged and accentuated edition of the infantile sketch; the hatred of the father and the death-wishes against him are no longer vague hints, the affection for the mother declares itself with the aim of possessing her as a woman. Are we really to accredit such grossness and intensity of the feelings to the tender age of childhood; or does the analysis deceive us by introducing another factor? It is not difficult to find one. Every time anyone describes anything past, even if he be a historian, we have to take into account all that he unintentionally imports into that past period from present and intermediate times, thereby falsifying it. With the neurotic it is even doubtful whether this retroversion is altogether unintentional; we shall hear later on that there are motives for it and we must explore the whole subject of the 'retrogressive phantasy-making' which goes back to the remote past. We soon discover, too, that the hatred against the father has been strengthened by a number of motives arising in later periods and other relationships in life, and that the sexual desires towards the mother have been moulded into forms which would have been as yet foreign to the child. But it would be a vain attempt if we endeavoured to explain the whole of the Oedipus complex by 'retrogressive phantasy-making,' and by motives originating in later periods of life. The infantile nucleus, with more or less of the accretions to it, remains intact, as is confirmed by direct observation of children. The clinical fact which confronts us behind the form of the Oedipus complex as established by analysis now becomes of the greatest practical importance. We learn that at the time of puberty, when the sexual instinct first asserts its demands in full strength, the old familiar incestuous objects are taken up again and again invested by the libido. The infantile object-choice was but a feeble venture in play, as it were, but it laid down the direction for the object-choice of puberty. At this time a very intense flow of feeling towards the Oedipus complex or in reaction to it comes into force; since their mental antecedents have become intolerable, however, these feelings must remain for the most part outside consciousness. From the time of puberty onward the human individual must devote himself to the great task of *freeing himself from the parents;* and only after this detachment is accomplished can he cease to be a child and so become a member of the social community. For a son, the task consists in releasing his libidinal desires from his mother, in order to employ them in the quest of an external love-object in reality; and in reconciling himself with his father if he has remained antagonistic to him, or in freeing himself from his domination if, in the reaction to the infantile revolt, he has lapsed into subservience to him. These tasks are laid down for every man; it is noteworthy how seldom they are carried through ideally, that is, how seldom they are solved in a manner psychologically as well as socially satisfactory. In neurotics, however, this detachment from the parents is not accomplished at all; the son remains all his life in subjection to his father, and incapable of transferring his libido to a new sexual object. In the reversed relationship the daughter's fate may be the same. In this sense the Oedipus complex is justifiably regarded as the kernel of the neuroses.

---

[8] Theodor Reik (1888–1969), Austrian psychologist who emigrated to the United States in 1938.

You will imagine how incompletely I am sketching a large number of the connections bound up with the Oedipus complex which practically and theoretically are of great importance. I shall not go into the variations and possible inversions of it at all. Of its less immediate effects I should like to allude to one only, which proves it to have influenced literary production in a far-reaching manner. Otto Rank has shown in a very valuable work that dramatists throughout the ages have drawn their material principally from the Oedipus and incest complex and its variations and masked forms.[9] It should also be remarked that long before the time of psychoanalysis the two criminal offences of Oedipus were recognized as the true expressions of unbridled instinct. Among the works of the Encyclopaedist Diderot[10] you will find the famous dialogue, *Le neveu de Rameau,* which was translated into German by no less a person than Goethe. There you may read these remarkable words: *Si le petit sauvage était abandonné à lui-même, qu'il conserva toute son inbecillité et qu'il réunit au peu de raison de l'enfant au berceau la violence des passions de l'homme de trente ans, il tordrait le cou à son pére et coucherait avec sa mère.*[11]

There is yet one thing more which I cannot pass over. The mother-wife of Oedipus must not remind us of dreams in vain. Do you still remember the results of our dream-analyses, how so often the dream-forming wishes proved perverse and incestuous in their nature, or betrayed an unsuspected enmity to near and beloved relatives? We then left the source of these evil strivings of feeling unexplained. Now you can answer this question yourselves. They are dispositions of the libido, and investments of objects by libido, belonging to early infancy and long since given up in conscious life, but which at night prove to be still present and in a certain sense capable of activity. But, since all men and not only neurotic persons have perverse, incestuous, and murderous dreams of this kind, we may infer that those who are normal to-day have also made the passage through the perversions and the object-investments of the Oedipus complex; and that this is the path of normal development; only that neurotics show in a magnified and exaggerated form what we also find revealed in the dream-analyses of normal people. And this is one of the reasons why we chose the study of dreams to lead up to that of neurotic symptoms.

[10] Denis Diderot (above, page 383); *Rameau's Nephew* was first published in 1762.

[11] If the little savage were left to himself, preserving all of his imbecility, and joined the small reason of the infant in the cradle to the violence of the passions of a man of thirty years of age, he would wring his father's neck and sleep with his mother.

Leo Tolstoy

1828–1910

For Tolstoy, art properly corresponds to the "religious view of life by the people among whom it arose." It follows that every people generates an art appropriate to itself. At least this was true until "church-Christianity," which Tolstoy thought had become debased in its institutional practices, ceased to be the maker of a truly religious view. Loss of belief by the upper classes changed art and made sheer enjoyment its only professed end. The result was false art, and Tolstoy is relentless in his rejection of it. He advocates, against this faithlessness, an art expressive of what he regards as the central message of Christianity—"that Christian principle of universal union which forms the religious perception of our time." Two kinds of art that meet this standard are, first, an art that expresses "feelings flowing from a perception of our sonship to God and of the brotherhood of Man," and, second, expression of "feelings of merriment, of pity, of cheerfulness, of tranquillity. . . ." Both generate a sense of brotherhood in the recipients.

True art, for Tolstoy, is communication and sharing of feelings between men. Its characteristics are (1) the individuality of the feeling, (2) clarity, and (3) (and foremost) sincerity. Tolstoy does not say explicitly how we are to know a work is sincere. Presumably if it conveys a sense of brotherhood its sincerity is proved, but one could, it seems, be sincerely immoral. There is also the question of whether a work of art is valuable if we have already experienced and assimilated a feeling of brotherhood. Presumably this repetition in different circumstances would be valuable as moral reinforcement.

Tolstoy pits himself against the current of theories of art of his time. He rejects all theories of beauty, aesthetic enjoyment, and the like. They are all reducible to either the mystical-transcendental or the hedonistic. The former he regards as absurd, the latter inadequate and decadent. Any art appealing only to the initiate, such as that apparently advocated by Mallarmé and the symbolists, or to a certain class is anathema because it separates people from each other. Tolstoy's attack on Beethoven, especially his *Ninth Symphony,* partly on this ground, is only one of several he makes against well-known and usually revered works.

In sum, Tolstoy judges a work solely on whether it has or has not been an instrument of human progress and contributes to the consequent diminishment of cruelty.

The standard translation is that by Aylmer Maude, *What Is Art? and Essays on Art* (1930). Maude is also editor of *Tolstoy on Art and Its Critics* (1924). See H. W. Garrod, *Tolstoi's Theory of Art* (1935); Isaiah Berlin, *The Hedgehog and the Fox* (1953); R. F. Christian, *Tolstoy: A Critical Introduction* (1969); Edward Crankshaw, *Tolstoy: The Making of a Novelist* (1974); Henry Gifford, *Tolstoy* (1982).

What Is Art?

from

Chapter IV

To the question, what is this art to which is offered up the labor of millions, the very lives of men, and even morality itself? we have extracted replies from the existing aesthetics which all amount to this, that the aim of art is beauty, that beauty is recognized by the enjoyment it gives, and that artistic enjoyment is a good and important thing, because it is enjoyment. In a word, that enjoyment is good because it is enjoyment. Thus what is considered the definition of art is no definition at all, but only a shuffle to justify existing art. Therefore, however strange it may seem to say so, in spite of the mountains of books written about art, no exact definition of art has been constructed. And the reason of this is that the conception of art has been based on the conception of beauty.

Chapter V

What is art if we put aside the conception of beauty, which confuses the whole matter? The latest and most comprehensible definitions of art, apart from the conception of beauty, are the following: (1) *a* Art is an activity arising even in the animal kingdom, and springing from sexual desire and the propensity to play (Schiller, Darwin, Spencer), and *b* accompanied by a pleasurable excitement of the nervous system (Grant Allen).[1] This is the physiological-evolutionary definition. (2) Art is the external manifestation, by means of lines, colors, movements, sounds, or words, of emotions felt by man (Véron). This is the experimental definition. According to the very latest definition (Sully), (3) art is "the production of some permanent object or passing action which is fitted not only to supply an active enjoyment to the producer, but to convey a pleasurable impression to a number of spectators or listeners, quite apart from any personal advantage to be derived from it."[2]

Notwithstanding the superiority of these definitions to the metaphysical definitions which depended on the conception of beauty, they are yet far from exact. The first, the physiological-evolutionary definition, (1) *a,* is inexact, because instead of speaking about the artistic activity itself, which is the real matter in hand, it treats of the derivation of art. The modification of it, *b,* based on the physiological effects on the human organism, is inexact because within the limits of such definition many other human activities can be included, as has occurred in the neoaesthetic theories which reckon as art the preparation of handsome clothes, pleasant scents, and even of victuals.

The experimental definition, (2), which makes art consist in the expression of emotions, is inexact because a man may express his emotions by means of lines, colors, sounds, or words and yet may not act on others by such expression—and then the manifestation of his emotions is not art.

The third definition (that of Sully) is inexact because in the production of objects or actions affording pleasure to the producer and a pleasant emotion to the spectators or hearers apart from personal advantage, may be included the showing of conjuring tricks or gymnastic exercises, and other activities which are not art. And further, many things the production of which does not afford pleasure to the producer and the sensation received from which is unpleasant, such as gloomy, heart-rending scenes in a poetic description or a play, may nevertheless be undoubted works of art.

The inaccuracy of all these definitions arises from the fact that in them all (as also in the metaphysical definitions) the object considered is the pleasure art may give, and not the purpose it may serve in the life of man and of humanity.

In order to define art correctly it is necessary first of all to cease to consider it as a means to pleasure, and to consider it as one of the conditions of human life. Viewing it in this way we cannot fail to observe that art is one of the means of intercourse between man and man.

Every work of art causes the receiver to enter into a certain kind of relationship both with him who produced or is producing the art, and with all those who, simultaneously, previously, or subsequently, receive the same artistic impression.

Speech transmitting the thoughts and experiences of men serves as a means of union among them, and art serves a similar purpose. The peculiarity of this latter means of intercourse, distinguishing it from intercourse by means of words, consists in this, that whereas by words a man transmits his thoughts to another, by art he transmits his feelings.

The activity of art is based on the fact that a man receiving through his sense of hearing or sight another man's expression of feeling, is capable of experiencing the emotion which moved the man who expressed it. To take the simplest example: one man laughs, and another who hears becomes merry, or a man weeps, and another who hears feels sorrow. A man is excited or irritated, and another man seeing him is brought to a similar state of mind. By his

---

Tolstoy's *What Is Art?* was first published in 1898. The selection is from *What Is Art? and Essays on Art,* translated by Aylmer Maude (London: Oxford University Press, 1930).

[1] Schiller (above, page 460); Charles Darwin (1809–1882), English naturalist; Herbert Spencer (1820–1903), English philosopher; Grant Allen (1848–1899), English naturalist.

[2] René Sully-Prudhomme (1839–1907), French poet.

movements or by the sounds of his voice a man expresses courage and determination or sadness and calmness, and this state of mind passes on to others. A man suffers, manifesting his sufferings by groans and spasms, and this suffering transmits itself to other people; a man expresses his feelings of admiration, devotion, fear, respect, or love, to certain objects, persons, or phenomena, and others are infected by the same feelings of admiration, devotion, fear, respect, or love, to the same objects, persons, or phenomena.

And it is on this capacity of man to receive another man's expression of feeling and to experience those feelings himself, that the activity of art is based.

If a man infects another or others directly, immediately, by his appearance or by the sounds he gives vent to at the very time he experiences the feeling; if he causes another man to yawn when he himself cannot help yawning, or to laugh or cry when he himself is obliged to laugh or cry, or to suffer when he himself is suffering—that does not amount to art.

Art begins when one person with the object of joining another or others to himself in one and the same feeling, expresses that feeling by certain external indications. To take the simplest example: a boy having experienced, let us say, fear on encountering a wolf, relates that encounter, and in order to evoke in others the feeling he has experienced, describes himself, his condition before the encounter, the surroundings, the wood, his own lightheartedness, and then the wolf's appearance, its movements, the distance between himself and the wolf, and so forth. All this, if only the boy when telling the story again experiences the feelings he had lived through, and infects the hearers and compels them to feel what he had experienced—is art. Even if the boy had not seen a wolf but had frequently been afraid of one, and if wishing to evoke in others the fear he had felt, he invented an encounter with a wolf and recounted it so as to make his hearers share the feelings he experienced when he feared the wolf, that also would be art. And just in the same way it is art if a man, having experienced either the fear of suffering or the attraction of enjoyment (whether in reality or in imagination), expresses these feelings on canvas or in marble so that others are infected by them. And it is also art if a man feels, or imagines to himself, feelings of delight, gladness, sorrow, despair, courage, or despondency, and the transition from one to another of these feelings, and expresses them by sounds so that the hearers are infected by them and experience them as they were experienced by the composer.

The feelings with which the artist infects others may be most various—very strong or very weak, very important or very insignificant, very bad or very good: feelings of love of one's country, self-devotion and submission to fate or to God expressed in a drama, raptures of lovers described in a novel, feelings of voluptuousness expressed in a picture, courage expressed in a triumphal march, merriment evoked by a dance, humor evoked by a funny story, the feeling of quietness transmitted by an evening landscape or by a lullaby, or the feeling of admiration evoked by a beautiful arabesque—it is all art.

If only the spectators or auditors are infected by the feelings which the author has felt, it is art.

To evoke in oneself a feeling one has once experienced and having evoked it in oneself then by means of movements, lines, colors, sounds, or forms expressed in words, so to transmit that feeling that others experience the same feeling—this is the activity of art.

Art is a human activity consisting in this, that one man consciously by means of certain external signs, hands on to others feelings he has lived through, and that others are infected by these feelings and also experience them.

Art is not, as the metaphysicians say, the manifestation of some mysterious idea of beauty or God; it is not, as the aesthetic physiologists say, a game in which man lets off his excess of stored-up energy; it is not the expression of man's emotions by external signs; it is not the production of pleasing objects; and, above all, it is not pleasure; but it is a means of union among men joining them together in the same feelings, and indispensable for the life and progress towards well-being of individuals and of humanity.

As every man, thanks to man's capacity to express thoughts by words, may know all that has been done for him in the realms of thought by all humanity before his day, and can in the present, thanks to this capacity to understand the thoughts of others, become a sharer in their activity and also himself hand on to his contemporaries and descendants the thoughts he has assimilated from others as well as those that have arisen in himself; so, thanks to man's capacity to be infected with the feelings of others by means of art, all that is being lived through by his contemporaries is accessible to him, as well as the feelings experienced by men thousands of years ago, and he has also the possibility of transmitting his own feelings to others.

If people lacked the capacity to receive the thoughts conceived by men who preceded them and to pass on to others their own thoughts, men would be like wild beasts, or like Kasper Hauser.[3]

And if men lacked this other capacity of being infected by art, people might be almost more savage still, and above all more separated from, and more hostile to, one another.

---

[3] [Tolstoy] "The foundling of Nuremberg," found in the marketplace of that town on May 23, 1828, apparently some sixteen years old. He spoke little and was almost totally ignorant even of common objects. He subsequently explained that he had been brought up in confinement underground and visited by only one man, whom he saw but seldom.

And therefore the activity of art is a most important one, as important as the activity of speech itself and as generally diffused.

As speech does not act on us only in sermons, orations, or books, but in all those remarks by which we interchange thoughts and experiences with one another, so also art in the wide sense of the word permeates our whole life, but it is only to some of its manifestations that we apply the term in the limited sense of the word.

We are accustomed to understand art to be only what we hear and see in theaters, concerts, and exhibitions; together with buildings, statues, poems, and novels. . . . But all this is but the smallest part of the art by which we communicate with one another in life. All human life is filled with works of art of every kind—from cradle song, jest, mimicry, the ornamentation of houses, dress, and utensils, to church services, buildings, monuments, and triumphal processions. It is all artistic activity. So that by art, in the limited sense of the word, we do not mean all human activity transmitting feelings but only that part which we for some reason select from it and to which we attach special importance.

This special importance has always been given by men to that part of this activity which transmits feelings flowing from their religious perception, and this small part they have specifically called art, attaching to it the full meaning of the word.

That was how men of old—Socrates, Plato, and Aristotle—looked on art.[4] Thus did the Hebrew prophets and the ancient Christians regard art. Thus it was, and still is, understood by the Mohammedans, and thus it still is understood by religious folk among our own peasantry.

Some teachers of mankind—such as Plato in his *Republic,* and people like the primitive Christians, the strict Mohammedans, and the Buddhists—have gone so far as to repudiate all art.

People viewing art in this way (in contradiction to the prevalent view of today which regards any art as good if only it affords pleasure) held and hold that art (as contrasted with speech, which need not be listened to) is so highly dangerous in its power to infect people against their wills, that mankind will lose far less by banishing all art than by tolerating each and every art.

Evidently such people were wrong in repudiating all art, for they denied what cannot be denied—one of the indispensable means of communication without which mankind could not exist. But not less wrong are the people of civilized European society of our class and day in favoring any art if it but serves beauty, that is, gives people pleasure.

Formerly people feared lest among works of art there might chance to be some causing corruption, and they prohibited art altogether. Now they only fear lest they should be deprived of any enjoyment art can afford, and they patronize any art. And I think the last error is much grosser than the first and that its consequences are far more harmful.

Chapter VI

But how could it happen that that very art which in ancient times was merely tolerated (if tolerated at all), should have come in our times to be invariably considered a good thing if only it affords pleasure?

It has resulted from the following causes. The estimation of the value of art (or rather, of the feelings it transmits) depends on men's perception of the meaning of life; depends on what they hold to be the good and the evil of life. And what is good and what is evil is defined by what are termed religions.

Humanity unceasingly moves forward from a lower, more partial and obscure understanding of life to one more general and more lucid. And in this as in every movement there are leaders—those who have understood the meaning of life more clearly than others—and of these advanced men there is always one who has in his words and by his life expressed this meaning more clearly, lucidly, and strongly, than others. This man's expression of the meaning of life, together with those superstitions, traditions, and ceremonies, which usually form round the memory of such a man, is what is called a religion. Religions are the exponents of the highest comprehension of life accessible to the best and foremost men at a given time in a given society—a comprehension towards which all the rest of that society must inevitably and irresistibly advance. And therefore religions alone have always served, and still serve, as bases for the valuation of human sentiments. If feelings bring men nearer the ideal their religion indicates, if they are in harmony with it and do not contradict it, they are good; if they estrange men from it and oppose it they are bad.

If the religion places the meaning of life in worshipping one God and fulfilling what is regarded as his will, as was the case among the Jews, then the feelings flowing from love of that God and of his law, when successfully transmitted through the art of poetry, by the prophets, by the Psalms, or by the epic of the book of Genesis, are good, high art. All opposing that, as for instance the transmission of feelings of devotion to strange gods, or of feelings incompatible with the law of God, would be considered bad art. Or if, as was the case among the Greeks, the religion places the meaning of life in earthly happiness, in beauty and in strength, then art successfully transmitting the joy and energy of life would be considered good art, but art transmitting feelings of effeminacy or despondency would be bad art. If the meaning of life is seen in the well-being of one's nation, or in honoring one's ancestors and continuing the mode of life led by them, as was the case among the Romans and the Chinese respectively, then art transmitting feelings of joy at the sacrifice of one's personal well-being for the common weal, or at the exaltation of one's ancestors and the maintenance of their traditions, would be considered good art; but art expressing feelings contrary to these would be regarded as bad. If the meaning of life is seen in freeing oneself from the yoke of animalism, as is the case among the Buddhists, then art successfully transmitting feelings that elevate the soul and humble the flesh will be good art, and all that transmits feelings strengthening the bodily passions will be bad art.

---

[4] Plato (above, page 16); Aristotle (above, page 52).

In every age and in every human society there exists a religious sense of what is good and what is bad common to that whole society, and it is this religious conception that decides the value of the feelings transmitted by art. Therefore among all nations art which transmitted feelings considered to be good by the general religious sense was recognized as being good and was encouraged, but art which transmitted feelings considered bad by this general religious sense was recognized as being bad and was rejected. All the rest of the immense field of art by means of which people communicate one with another was not esteemed at all and was only noticed when it ran counter to the religious conception of its age, and then merely to be repudiated. Thus it was among all nations—Greeks, Jews, Indians, Egyptians, and Chinese—and so it was when Christianity appeared.

The Christianity of the first centuries recognized as productions of good art only legends, lives of saints, sermons, prayers, and hymn-singing, evoking love of Christ, emotion at his life, desire to follow his example, renunciation of worldly life, humility, and the love of others; all productions transmitting feelings of personal enjoyment they considered to be bad, and therefore rejected; for instance, tolerating plastic representations only when they were symbolical, they rejected all the pagan sculptures.

This was so among the Christians of the first centuries, who accepted Christ's teaching if not quite in its true form at least not in the perverted, paganized form in which it was subsequently held.

But besides this Christianity, from the time of the wholesale conversion of nations by order of the authorities, as in the days of Constantine, Charlemagne, and Vladímir,[5] there appeared another, a church-Christianity, which was nearer to paganism than to Christ's teaching. And in accord with its own teaching, this church-Christianity estimated quite otherwise the feelings of people and the productions of art which transmitted those feelings.

This church-Christianity not only did not acknowledge the fundamental and essential positions of true Christianity—the immediate relationship of each man to the Father, the consequent brotherhood and equality of all men, and the substitution of humility and love in place of any kind of violence—but on the contrary, having set up a heavenly hierarchy similar to the pagan mythology, and having introduced the worship of Christ, of the Virgin, of angels, of apostles, of saints, and of martyrs, and not only of these divinities themselves but also of their images, it made blind faith in the church and in its ordinances the essential point of its teaching.

However foreign this teaching may have been to true Christianity, however degraded, not only in comparison with true Christianity but even with the conception of life of Romans such as Julian[6] and others, for all that it was to the barbarians who accepted it, a higher doctrine than their former adoration of gods, heroes, and good and bad spirits. And therefore this teaching was a religion to them, and on the basis of this religion the art of that time was assessed. And art transmitting pious adoration of the Virgin, Jesus, the saints, and the angels, a blind faith in and submission to the church, fear of torments, and hope of blessedness in a life beyond the grave, was considered good, while all art opposed to this was held to be bad.

The teaching on the basis of which this art arose was a perversion of Christ's teaching, but the art which sprang up on this perverted teaching was for all that a true art, since it corresponded to the religious view of life held by the people among whom it arose.

The artists of the Middle Ages, vitalized by the same source of feeling—religion—as the mass of the people, and transmitting in architecture, sculpture, painting, music, poetry, or drama, the feelings and states of mind they experienced, were true artists; and their activity, founded on the highest conceptions accessible to their age and common to the entire people—though for our times a mean art—was nevertheless a true one, shared by the whole community.

---

[5] Constantine I (c. 280–337), first Christian emperor of Rome; Charlemagne (742–814), establisher of the Holy Roman Empire; Vladímir I (c. 956–1015), czar of Russia.

[6] Julian the Apostate (331–363), emperor of Rome.

And this was the state of things until in the upper, rich, more educated, classes of European society doubt arose as to the truth of the understanding of life which was expressed by church-Christianity. When after the Crusades and the maximum development of papal power and its abuses, people of the rich classes became acquainted with the wisdom of the classics, and saw on the one hand the reasonable lucidity of the teaching of the ancient sages, and on the other hand the incompatibility of the church doctrine with the teaching of Christ, it became impossible for them to continue to believe the church teaching.

If in externals they still kept to the forms of church teaching, they could no longer believe in it, and held to it only by inertia and to influence the masses, who continued to believe blindly in church doctrine and whom the upper classes for their own advantage considered it necessary to encourage in those beliefs.

So that a time came when church-Christianity ceased to be the general religious doctrine of all Christian people: some—the masses—continued blindly to believe in it, but the upper classes—those in whose hands lay the power and wealth, and therefore the leisure to produce art and the means to stimulate it—ceased to believe that teaching.

In regard to religion the upper circles of the Middle Ages found themselves in the position educated Romans were in before Christianity arose, that is, they no longer believed in the religion of the masses but had no beliefs to put in place of the worn-out church doctrine which for them had lost its meaning.

There was only this difference, that whereas for the Romans who lost faith in their emperor gods and household gods it was impossible to extract anything further from all the complex mythology they had borrowed from conquered nations, and it was consequently necessary to find a completely new conception of life, the people of the Middle Ages when they doubted the truth of the church teaching had no need to seek a fresh one. That Christian teaching which they professed in a perverted form as church doctrine, had mapped out the path of human progress so far ahead that they needed only to rid themselves of those perversions which hid the teaching announced by Christ and to adopt its real meaning—if not completely, at least in a greater degree than the church had done. And this was partially accomplished not only in the reformations of Wyclif, Huss, Luther, and Calvin,[7] but by the whole current of nonchurch Christianity represented in earlier times by the Paulicians and the Bogomilites, and afterwards by the Waldenses and other nonchurch Christians, who were called heretics.[8] But this could be, and was, done chiefly by poor people—who did not rule. A few of the rich and strong, such as Francis of Assisi[9] and others, accepted the Christian teaching in its full significance even though it undermined their privileged positions. But most people of the upper classes (though in the depth of their souls they had lost faith in the church teaching) could not or would not act thus, because the essence of that Christian view of life which stood ready to be adopted when once they rejected the church faith, was a teaching of the brotherhood (and therefore the equality) of man, and this condemned the privileges by which they lived, in which they had grown up and been educated, and to which they were accustomed. Not in the depth of their hearts believing in the church teaching—which had outlived its age and had no longer any true meaning for them—and not being strong enough to accept true Christianity, men of these rich, governing classes—popes, kings, dukes, and all the great ones of the earth—were left without any religion, with but the external forms of one, which they supported as being profitable and even necessary for themselves since these forms maintained a teaching which justified the privileges they made use of. In reality these people believed in nothing, just as the Romans of the first centuries of our era believed in nothing. But at the same time they were the people who had the power and the wealth, and they were the people who rewarded art and directed it.

And it should be remarked that it was just among these people that there grew up an art esteemed not according to its success in expressing men's religious feelings, but in proportion to its beauty—in other words, according to the enjoyment it gave.

No longer able to believe in the church religion whose falsehood they had detected, and incapable of accepting true Christian teaching which denounced their whole manner of life, these rich and powerful people, stranded with no religious conception of life, involuntarily returned to the pagan view of things which places life's meaning in personal enjoyment. And then took place among the upper classes what is called the Renaissance of science and art, which was really not only a denial of every religion, but also an assertion that religion is unnecessary.

The church doctrine is so coherent a system that it cannot be altered or corrected without destroying it altogether. As soon as doubt arose with regard to the infallibility of the pope (and this doubt was then in the minds of all educated people), doubt inevitably followed as to the truth of tradition. But doubt as to the truth of tradition is fatal not only to popery and Catholicism but also to the whole church creed with all its dogmas: the divinity of Christ, the resurrection, and the Trinity; and it destroys the authority of the Scriptures, since they were considered to be inspired only because the tradition of the church so decided.

---

[7] John Wycliffe (c. 1320–1384), John Huss (c. 1369–1415), Martin Luther (1483–1546), John Calvin (1509–1564), all Christian religious reformers.

[8] French Puritan dissenters from Catholicism (c. 1170).

[9] Saint Francis (1182–1226), founder of the Franciscan order.

So that the majority of the highest classes of that age, even the popes and the ecclesiastics, really believed in nothing at all. In the church doctrine these people did not believe, for they saw its insolvency; but neither could they follow Francis of Assisi, Peter of Chelczic,[10] and most of the heretics, in acknowledging the moral, social teaching of Christ, for that teaching undermined their social position. So these people remained without any religious view of life; and having none, they could have no standard whereby to estimate what was good and what was bad art, except that of personal enjoyment. And having acknowledged their criterion of what was good to be pleasure, that is beauty, these people of the upper classes of European society went back in their comprehension of art to the gross conception of the primitive Greeks, which Plato had already condemned. And conformably to this understanding of life a theory of art was formulated.

Chapter XV

Art in our society has become so perverted that not only has bad art come to be considered good, but even the very perception of what art really is has been lost. In order to be able to speak about the art of our society it is, therefore, first of all necessary to distinguish art from counterfeit art.

There is one indubitable sign distinguishing real art from its counterfeit—namely, the infectiousness of art. If a man without exercising effort and without altering his standpoint, on reading, hearing, or seeing another man's work experiences a mental condition which unites him with that man and with others who are also affected by that work, then the object evoking that condition is a work of art. And however poetic, realistic, striking, or interesting, a work may be, it is not a work of art if it does not evoke that feeling (quite distinct from all other feelings) of joy and of spiritual union with another (the author) and with others (those who are also infected by it).

It is true that this indication is an *internal* one and that there are people who, having forgotten what the action of real art is, expect something else from art (in our society the great majority are in this state), and that therefore such people may mistake for this aesthetic feeling the feeling of diversion and a certain excitement which they receive from counterfeits of art. But though it is impossible to undeceive these people, just as it may be impossible to convince a man suffering from color blindness that green is not red, yet for all that, this indication remains perfectly definite to those whose feeling for art is neither perverted nor atrophied, and it clearly distinguishes the feeling produced by art from all other feelings.

The chief peculiarity of this feeling is that the recipient of a truly artistic impression is so united to the artist that he feels as if the work were his own and not someone else's—as if what it expresses were just what he had long been wishing to express. A real work of art destroys in the consciousness of the recipient the separation between himself and the artist, and not that alone, but also between himself and all whose minds receive this work of art. In this freeing of our personality from its separation and isolation, in this uniting of it with others, lies the chief characteristic and the great attractive force of art.

If a man is infected by the author's condition of soul, if he feels this emotion and this union with others, then the object which has effected this is art; but if there be no such infection, if there be not this union with the author and with others who are moved by the same work—then it is not art. And not only is infection a sure sign of art, but the degree of infectiousness is also the sole measure of excellence in art.

The stronger the infection the better is the art, as art, speaking of it now apart from its subject matter—that is, not considering the value of the feelings it transmits.

And the degree of the infectiousness of art depends on three conditions: (1) On the greater or lesser individuality of the feeling transmitted; (2) on the greater or lesser clearness with which the feeling is transmitted; (3) on the sincerity of the artist, that is, on the greater or lesser force with which the artist himself feels the emotion he transmits.

The more individual the feeling transmitted the more strongly does it act on the recipient; the more individual the state of soul into which he is transferred the more pleasure does the recipient obtain and therefore the more readily and strongly does he join in it.

Clearness of expression assists infection because the recipient who mingles in consciousness with the author is the better satisfied the more clearly that feeling is transmitted which, as it seems to him, he has long known and felt and for which he has only now found expression.

But most of all is the degree of infectiousness of art increased by the degree of sincerity in the artist. As soon as the spectator, hearer, or reader, feels that the artist is infected by his own production and writes, sings, or plays, for himself, and not merely to act on others, this mental condition of the artist infects the recipient; and, on the contrary, as soon as the spectator, reader, or hearer, feels that the author is not writing, singing, or playing, for his own satisfaction—does not himself feel what he wishes to express, but is doing it for him, the recipient—resistance immediately springs up, and the most individual and the newest feelings and the cleverest technique not only fail to produce any infection but actually repel.

---

[10] Petr Chelcický (c. 1390–c. 1460), Czech reformer, whose followers founded the Moravians.

I have mentioned three conditions of contagion in art, but they may all be summed up into one, the last, sincerity; that is, that the artist should be impelled by an inner need to express his feeling. That condition includes the first; for if the artist is sincere he will express the feeling as he experienced it. And as each man is different from everyone else, his feeling will be individual for everyone else; and the more individual it is—the more the artist has drawn it from the depths of his nature—the more sympathetic and sincere will it be. And this same sincerity will impel the artist to find clear expression for the feeling which he wishes to transmit.

Therefore this third condition—sincerity—is the most important of the three. It is always complied with in peasant art, and this explains why such art always acts so powerfully; but it is a condition almost entirely absent from our upper-class art, which is continually produced by artists actuated by personal aims of covetousness or vanity.

Such are the three conditions which divide art from its counterfeits, and which also decide the quality of every work of art considered apart from its subject matter.

The absence of any one of these conditions excludes a work from the category of art and relegates it to that of art's counterfeits. If the work does not transmit the artist's peculiarity of feeling and is therefore not individual, if it is unintelligibly expressed, or if it has not proceeded from the author's inner need for expression—it is not a work of art. If all these conditions are present even in the smallest degree, then the work even if a weak one is yet a work of art.

The presence in various degrees of these three conditions: individuality, clearness, and sincerity, decides the merit of a work of art as art, apart from subject matter. All works of art take order of merit according to the degree in which they fulfill the first, the second, and the third, of these conditions. In one the individuality of the feeling transmitted may predominate; in another, clearness of expression; in a third, sincerity; while a fourth may have sincerity and individuality but be deficient in clearness; a fifth, individuality and clearness, but less sincerity; and so forth, in all possible degrees and combinations.

Thus is art divided from what is not art, and thus is the quality of art, as art, decided, independently of its subject matter, that is to say, apart from whether the feelings it transmits are good or bad.

But how are we to define good and bad art with reference to its content or subject matter?

from
Chapter XVI

How in the subject matter of art are we to decide what is good and what is bad?

Art like speech is a means of communication and therefore of progress, that is, of the movement of humanity forward towards perfection. Speech renders accessible to men of the latest generations all the knowledge discovered by the experience and reflection both of preceding generations and of the best and foremost men of their own times; art renders accessible to men of the latest generations all the feelings experienced by their predecessors and also those felt by their best and foremost contemporaries. And as the evolution of knowledge proceeds by truer and more necessary knowledge dislodging and replacing what was mistaken and unnecessary, so the evolution of feeling proceeds by means of art—feelings less kind and less necessary for the well-being of mankind being replaced by others kinder and more needful for that end. That is the purpose of art. And speaking now of the feelings which are its subject matter, the more art fulfills that purpose the better the art, and the less it fulfills it the worse the art.

The appraisement of feelings (that is, the recognition of one or other set of feelings as more or less good, more or less necessary for the well-being of mankind) is effected by the religious perception of the age.

In every period of history and in every human society there exists an understanding of the meaning of life, which represents the highest level to which men of that society have attained—an understanding indicating the highest good at which that society aims. This understanding is the religious perception of the given time and society. And this religious perception is always clearly expressed by a few advanced men and more or less vividly perceived by members of the society generally. Such a religious perception and its corresponding expression always exists in every society. If it appears to us that there is no religious perception in our society, this is not because there really is none, but only because we do not wish to see it. And we often wish not to see it because it exposes the fact that our life is inconsistent with that religious perception.

Religious perception in a society is like the direction of a flowing river. If the river flows at all it must have a direction. If a society lives, there must be a religious perception indicating the direction in which, more or less consciously, all its members tend.

And so there always has been, and is, a religious perception in every society. And it is by the standard of this religious perception that the feelings transmitted by art have always been appraised. It has always been only on the basis of this religious perception of their age, that men have chosen from amid the endlessly varied spheres of art that art which transmitted feelings making religious perception operative in actual life. And such art has always been highly valued and encouraged, while art transmitting feelings already outlived, flowing from the antiquated religious perceptions of a former age, has always been condemned and despised. All the rest of art transmitting those most diverse feelings by means of which people commune with one another was not condemned and was tolerated if only it did not transmit feelings contrary to religious perception. Thus for instance among the Greeks, art transmitting feelings of beauty, strength, and courage (Hesiod, Homer, Phidias)[11] was chosen, approved, and encouraged, while art transmitting feelings of rude sensuality, despondency, and effeminacy, was condemned and despised. Among the Jews, art transmitting feelings of devotion and submission to the God of the Hebrews and to his will (the epic of Genesis, the prophets, the Psalms) was chosen and encouraged, while art transmitting feelings of idolatry (the golden calf) was condemned and despised. All the rest of art—stories, songs, dances, ornamentation of houses, of utensils, and of clothes—which was not contrary to religious perception, was neither distinguished nor discussed. Thus as regards its subject matter has art always and everywhere been appraised and thus it should be appraised, for this attitude towards art proceeds from the fundamental characteristics of human nature, and those characteristics do not change.

I know that according to an opinion current in our times religion is a superstition humanity has outgrown, and it is therefore assumed that no such thing exists as a religious perception common to us all by which art in our time can be appraised. I know that this is the opinion current in the pseudocultured circles of today. People who do not acknowledge Christianity in its true meaning because it undermines their social privileges, and who therefore invent all kinds of philosophic and aesthetic theories to hide from themselves the meaninglessness and wrongfulness of their lives, cannot think otherwise. These people intentionally, or sometimes unintentionally, confuse the notion of a religious cult with the notion of religious perception, and think that by denying the cult they get rid of the perception. But even the very attacks on religion and the attempts to establish an idea of life contrary to the religious perception of our times, most clearly demonstrate the existence of a religious perception condemning the lives that are not in harmony with it.

If humanity progresses, that is, moves forward, there must inevitably be a guide to the direction of that movement. And religions have always furnished that guide. All history shows that the progress of humanity is accomplished no otherwise than under the guidance of religion. But if the race cannot progress without the guidance of religion—and progress is always going on, and consequently goes on also in our own times—then there must be a religion of our times. So that whether it pleases or displeases the so-called cultured people of today, they must admit the existence of religion—not of a religious cult, Catholic, Protestant, or another, but of religious perception—which even in our times is the guide always present where there is any progress. And if a religious perception exists amongst us, then the feelings dealt with by our art should be appraised on the basis of that religious perception; and as has been the case always and everywhere, art transmitting feelings flowing from the religious perception of our time should be chosen from amid all the indifferent art, should be acknowledged, highly valued, and encouraged, while art running counter to that perception should be condemned and despised, and all the remaining, indifferent art should neither be distinguished nor encouraged.

The religious perception of our time in its widest and most practical application is the consciousness that our well-being, both material and spiritual, individual and collective, temporal and eternal, lies in the growth of brotherhood among men—in their loving harmony with one another. This perception is not only expressed by Christ and all the best men of past ages, it is not only repeated in most varied forms and from most diverse sides by the best men of our times, but it already serves as a clue to all the complex labor of humanity, consisting as this labor does on the one hand in the destruction of physical and moral obstacles to the union of men, and on the other hand in establishing the principles common to all men which can and should unite them in one universal brotherhood. And it is on the basis of this perception that we should appraise all the phenomena of our life and among the rest our art also: choosing from all its realms and highly prizing and encouraging whatever transmits feelings flowing from this religious perception, rejecting whatever is contrary to it, and not attributing to the rest of art an importance that does not properly belong to it.

---

[11] Hesiod (eighth century B.C.), Homer (eighth century B.C.), Greek poets; Phidias (fifth century B.C.), Greek sculptor.

The chief mistake made by people of the upper classes at the time of the so-called Renaissance—a mistake we still perpetuate—was not that they ceased to value and attach importance to religious art (people of that period could not attach importance to it because, like our own upper classes, they could not believe in what the majority considered to be religion), but their mistake was that they set up in place of the religious art that was lacking, an insignificant art which aimed merely at giving pleasure, that is, they began to choose, to value, and to encourage, in place of religious art, something which in any case did not deserve such esteem and encouragement.

One of the fathers of the church said that the great evil is not that men do not know God, but that they have set up instead of God, that which is not God. So also with art. The great misfortune of the people of the upper classes of our time is not so much that they are without a religious art as that, instead of a supreme religious art chosen from all the rest as being specially important and valuable, they have chosen a most insignificant and, usually, harmful art, which aims at pleasing certain people and which therefore, if only by its exclusive nature, stands in contradiction to that Christian principle of universal union which forms the religious perception of our time. Instead of religious art, an empty and often vicious art is set up, and this hides from men's notice the need of that true religious art which should be present in life to improve it.

It is true that art which satisfies the demands of the religious perception of our time is quite unlike former art, but notwithstanding this dissimilarity, to a man who does not intentionally hide the truth from himself, what forms the religious art of our age is very clear and definite. In former times when the highest religious perception united only some people (who even if they formed a large society were yet but one society among others—Jews, or Athenian or Roman citizens), the feelings transmitted by the art of that time flowed from a desire for the might, greatness, glory, and prosperity of that society, and the heroes of art might be people who contributed to that prosperity by strength, by craft, by fraud, or by cruelty (Ulysses, Jacob, David, Samson, Hercules, and all the heroes). But the religious perception of our times does not select any one society of men; on the contrary it demands the union of all—absolutely of all people without exception—and above every other virtue it sets brotherly love of all men. And therefore the feelings transmitted by the art of our time not only cannot coincide with the feelings transmitted by former art, but must run counter to them.

Christian, truly Christian, art has been so long in establishing itself, and has not yet established itself, just because the Christian religious perception was not one of those small steps by which humanity advances regularly, but was an enormous revolution which, if it has not already altered, must inevitably alter the entire conception of life of mankind, and consequently the whole internal organization of that life. It is true that the life of humanity, like that of an individual, moves regularly; but in that regular movement come, as it were, turning points which sharply divide the preceding from the subsequent life. Christianity was such a turning point; such at least it must appear to us who live by the Christian perception of life. Christian perception gave another, a new direction to all human feelings, and therefore completely altered both the content and the significance of art. The Greeks could make use of Persian art and the Romans could use Greek art, or, similarly, the Jews could use Egyptian art—the fundamental ideals were one and the same. Now the ideal was the greatness and prosperity of the Persians, now the greatness and prosperity of the Greeks, now that of the Romans. The same art was transferred to other conditions and served new nations. But the Christian ideal changed and reversed everything, so that, as the Gospel puts it, "That which was exalted among men has become an abomination in the sight of God."[12] The ideal is no longer the greatness of Pharaoh or of a Roman emperor, not the beauty of a Greek nor the wealth of Phoenicia, but humility, purity, compassion, love. The hero is no longer Dives, but Lazarus the beggar; not Mary Magdalene in the day of her beauty but in the day of her repentance; not those who acquire wealth but those who have abandoned it; not those who dwell in palaces but those who dwell in catacombs and huts; not those who rule over others, but those who acknowledge no authority but God's. And the greatest work of art is no longer a cathedral of victory with statues of conquerors, but the representation of a human soul so transformed by love that a man who is tormented and murdered, yet pities and loves his persecutors.

And the change is so great that men of the Christian world find it difficult to resist the inertia of the heathen art to which they have been accustomed all their lives. The subject matter of Christian religious art is so new to them, so unlike the subject matter of former art, that it seems to them as though Christian art were a denial of art, and they cling desperately to the old art. But this old art, having no longer in our day any source in religious perception, has lost its meaning, and we shall have to abandon it whether we wish to or not.

---

[12] Luke 16.15.

The essence of the Christian perception consists in the recognition by every man of his sonship to God and of the consequent union of men with God and with one another, as is said in the Gospel (John 17:21[13]). Therefore the subject matter of Christian art is of a kind that feeling can unite men with God and with another.

The expression *unite men with God and with one another* may seem obscure to people accustomed to the misuse of these words that is so customary, but the words have a perfectly clear meaning nevertheless. They indicate that the Christian union of man (in contradiction to the partial, exclusive, union of only certain men) is that which unites all without exception.

Art, all art, has this characteristic, that it unites people. Every art causes those to whom the artist's feeling is transmitted to unite in soul with the artist and also with all who receive the same impression. But non-Christian art, while uniting some people, makes that very union a cause of separation between these united people and others; so that union of this kind is often a source not merely of division but even of enmity towards others. Such is all patriotic art, with its anthems, poems, and monuments; such is all church art, that is, the art of certain cults, with their images, statues, processions, and other local ceremonies. Such art is belated and non-Christian, uniting the people of one cult only to separate them yet more sharply from the members of other cults, and even to place them in relations of hostility to one another. Christian art is such only as tends to unite all without exception, either by evoking in them the perception that each man and all men stand in a like relation towards God and towards their neighbor, or by evoking in them identical feelings, which may even be the very simplest, provided that they are not repugnunt to Christianity and are natural to everyone without exception.

Good Christian art of our time may be unintelligible to people because of imperfections in its form or because men are inattentive to it, but it must be such that all men can experience the feelings it transmits. It must be the art not of some one group of people, or of one class, or of one nationality, or of one religious cult; that is, it must not transmit feelings accessible only to a man educated in a certain way, or only to an aristocrat, or a merchant, or only to a Russian, or a native of Japan, or a Roman Catholic, or a Buddhist, and so on, but it must transmit feelings accessible to everyone. Only art of this kind can in our time be acknowledged to be good art, worthy of being chosen out from all the rest of art and encouraged.

Christian art, that is, the art of our time, should be catholic in the original meaning of the word, that is, universal, and therefore it should unite all men. And only two kinds of feeling unite all men: first, feelings flowing from a perception of our sonship to God and of the brotherhood of man; and next, the simple feelings of common life accessible to everyone without exception—such as feelings of merriment, of pity, of cheerfulness, of tranquility, and so forth. Only these two kinds of feelings can now supply material for art good in its subject matter.

And the action of these two kinds of art apparently so dissimilar, is one and the same. The feelings flowing from the perception of our sonship to God and the brotherhood of man—such as a feeling of sureness in truth, devotion to the will of God, self-sacrifice, respect for and love of man—evoked by Christian religious perception; and the simplest feelings, such as a softened or a merry mood caused by a song or an amusing jest intelligible to everyone, or by a touching story, or a drawing, or a little doll: both alike produce one and the same effect—the loving union of man with man. Sometimes people who are together, if not hostile to one another, are at least estranged in mood and feeling, till perhaps a story, a performance, a picture, or even a building, but oftenest of all music, unites them all as by an electric flash, and in place of their former isolation or even enmity they are conscious of union and mutual love. Each is glad that another feels what he feels; glad of the communion established not only between him and all present, but also with all now living who will yet share the same impression; and, more than that, he feels the mysterious gladness of a communion which, reaching beyond the grave, unites us with all men of the past who have been moved by the same feelings and with all men of the future who will yet be touched by them. And this effect is produced both by religious art which transmits feelings of love of God and one's neighbor, and by universal art transmitting the very simplest feelings common to all men.

The art of our time should be appraised differently from former art chiefly in this, that the art of our time, that is, Christian art (basing itself on a religious perception which demands the union of man), excludes from the domain of art good in its subject matter, everything transmitting exclusive feelings which do not unite men but divide them. It relegates such work to the category of art that is bad in its subject matter; while on the other hand it includes in the category of art that is good in subject matter a section not formerly admitted as deserving of selection and respect, namely, universal art transmitting even the most trifling and simple feelings if only they are accessible to all men without exception, and therefore unite them. Such art cannot but be esteemed good in our time, for it attains the end which Christianity, the religious perception of our time, sets before humanity.

---

[13] [Maude] "That they may all be one; even as thou, father, art in me and I in thee, that they may also be in us."

Christian art either evokes in men feelings which through love of God and of one's neighbor draw them to closer and ever closer union and make them ready for, and capable of, such union; or evokes in them feelings which show them that they are already united in the joys and sorrows of life. And therefore the Christian art of our time can be and is of two kinds: first, art transmitting feelings flowing from a religious perception of man's position in the world in relation to God and to his neighbor—religious art in the limited meaning of the term; and secondly, art transmitting the simplest feelings of common life, but such always as are accessible to all men in the whole world—the art of common life—the art of the people—universal art. Only these two kinds of art can be considered good art in our time.

* * *

In the arts of painting and sculpture, all pictures and statues in so-called genre style, representations of animals, landscapes, and caricatures with subjects comprehensible to everyone, and also all kinds of ornaments, are universal in subject matter. Such productions in painting and sculpture are very numerous (for instance, china dolls), but for the most part such objects (for instance, ornaments of all kinds) are either not considered to be art or are considered to be art of a low quality. In reality all such objects if only they transmit a true feeling experienced by the artist and comprehensible to everyone (however insignificant it may seem to us to be), are works of real, good, Christian art.

I fear it will here be urged against me that having denied that the conception of beauty can supply a standard for works of art, I contradict myself by acknowledging ornaments to be works of good art. The reproach is unjust, for the subject matter of all kinds of ornamentation consists not in the beauty but in the feeling (of admiration at, and delight in, the combination of lines and colors) which the artist has experienced and with which he infects the spectator. Art remains what it was and what it must be: nothing but the infection by one man of another or of others with the feelings experienced by the artist. Among these feelings is the feeling of delight at what pleases the sight. Objects pleasing the sight may be such as please a small or a large number of people, or such as please all men—and ornaments for the most part are of the latter kind. A landscape representing a very unusual view, or a genre picture of a special subject, may not please everyone, but ornaments, from Yakútsk ornaments to Greek ones, are intelligible to everyone and evoke a similar feeling of admiration in all, and therefore this despised kind of art should in Christian society be esteemed far above exceptional, pretentious pictures and sculptures.

So that in relation to feelings conveyed, there are only two kinds of good Christian art, all the rest of art not comprised in these two divisions should be acknowledged to be bad art, deserving not to be encouraged but to be driven out, denied, and despised, as being art not uniting but dividing people. Such in literary art are all novels and poems which transmit ecclesiastical or patriotic feelings, and also exclusive feelings pertaining only to the class of the idle rich: such as aristocratic honor, satiety, spleen, pessimism, and refined and vicious feelings, flowing from sex-love—quite incomprehensible to the great majority of mankind.

In painting we must similarly place in the class of bad art all ecclesiastical, patriotic, and exclusive pictures; all pictures representing the amusements and allurements of a rich and idle life; all so-called symbolic pictures in which the very meaning of the symbol is comprehensible only to those of a certain circle; and above all pictures with voluptuous subjects—all that odious female nudity which fills all the exhibitions and galleries. And to this class belongs almost all the chamber and opera music of our times—beginning especially with Beethoven (Schumann, Berlioz, Liszt, Wagner)[14]—by its subject matter devoted to the expression of feelings accessible only to people who have developed in themselves an unhealthy nervous irritation evoked by this exclusive, artificial, and complex music.

"What! the *Ninth Symphony* not a good work of art!" I hear exclaimed by indignant voices.

And I reply: Most certainly it is not. All that I have written I have written with the sole purpose of finding a clear and reasonable criterion by which to judge the merits of works of art. And this criterion, coinciding with the indications of plain and sane sense, indubitably shows me that that symphony of Beethoven's is not a good work of art. Of course to people educated in the worship of certain productions and of their authors, to people whose taste has been perverted just by being educated in such a worship, the acknowledgment that such a celebrated work is bad, is amazing and strange. But how are we to escape the indications of reason and common sense?

Beethoven's *Ninth Symphony* is considered a great work of art. To verify its claim to be such I must first ask myself whether this work transmits the highest religious feeling? I reply in the negative, since music in itself cannot transmit those feelings; and therefore I ask myself next: Since this work does not belong to the highest kind of religious art, has it the other characteristic of the good art of our time—the quality of uniting all men in one common feeling—does it rank as Christian universal art? And again I have no option but to reply in the negative; for not only do I not see how the feelings transmitted by this work could unite people not specially trained to submit themselves to its complex hypnotism, but I am unable to imagine to myself a crowd of normal people who could understand anything of this long, confused, and artificial production, except short snatches which are lost in a sea of what is incomprehensible. And therefore, whether I like it or not, I am compelled to conclude that this work belongs to the rank of bad art. It is curious to note in this connection, that attached to the end of this very symphony is a poem of Schiller's which (though somewhat obscurely) expresses this very thought, namely, that feeling (Schiller speaks only of the feeling of gladness) unites people and evokes love in them. But though this poem is sung at the end of the symphony, the music does not accord with the thought expressed in the verses; for the music is exclusive and does not unite all men, but unites only a few, dividing them off from the rest of mankind.

---

[14] All nineteenth-century German composers.

Edmund Husserl

1859–1938

Though Edmund Husserl is most frequently cited as the principal originator of Phenomenology, that identification has, in many ways, obscured his pivotal importance for the unfolding of twentieth-century intellectual history. In the context of this anthology, and for theory in the humanities, Husserl, particularly in his work before he turned his attention to Phenomenology, appears conspicuously at the crossroads of virtually every major subsequent movement—and not coincidentally, counts among his students both Martin Heidegger and Rudolph Carnap. His earliest major work, *The Philosophy of Arithmetic* (1891), set forth a view of mathematical theory that drew significantly upon psychology—a decision that drew the very sharp and powerful criticism of Gottlob Frege (above, page 734) whose *Foundations of Arithmetic* was published almost a decade earlier, in 1884. It is worth remarking that Frege himself had encountered stinging criticism from the mathematician Georg Cantor (1845–1918), and remained convinced that Cantor had not understood his work. Frege's own review of Husserl could arguably be characterized in a similar way, though the point of difference between Frege's strict formalism and Husserl's reliance on conscious intuition was much more sharp—just as the effect of Frege's aggressively polemical review was evidently much more unsettling. Husserl, however, proceeded with a determination but with serious doubts as to the possibility of reformulating the appraisal of psychology as an empirical pursuit without giving up the philosophical attention to the direct experience of intentional consciousness, a concern he shared in common with his teacher, Franz Brentano (1838–1917). What was at stake, for Husserl, was the fundamental question of whether or not, given the prodigious advances of a formalist view of mathematics and logic, it was still possible to incorporate into the study of these crucial subjects the richness of the actual experience of thinking and the subtlety of insight as the very life of conscious experience that evidently could not be reduced to formal rules. This concern remained the hallmark of Husserl's work throughout his long career.

It was in his remarkable *Logical Investigations* (1900–1901; second edition, 1913) that Husserl carried out what is increasingly regarded as his most important and interesting work. In the "Prolegomena to Pure Logic," itself almost a separate book introducing *Logical Investigations,* Husserl begins with his clear and insistent recognition that the subject could not be fruitfully pursued without a critical account of the work of British empiricist philosophers, especially John Stuart Mill and David Hume, but that stopping there would compromise the objective of understanding logic as a theory of science without reducing it to a merely sterile formalism. Husserl urged instead a "thoroughgoing *division of labour*" between formal mathematics and philosophy, though treating formal mathematics as a "special science" with a crucial, though more limited technical aim in formulating rules and facilitating scientific prediction. Philosophical investigation, on the other hand, aims to clarify "the essence of a thing, an event, a cause," but especially "that wonderful affinity which this essence has with essence of thought, which enables it to be thought, with the essence of knowledge, which makes it knowable, with meanings which make it capable of being meant. . . ."[1]

From this point of view, *Logical Investigations* provided Husserl with the point of departure for the later development of Phenomenology, but it was first of all, one of the earliest and most important texts for the increasingly pervasive "linguistic turn" in subsequent philosophy and criticism. Here too, Husserl differed quite sharply from Frege, whose *Sense and Meaning* (above, page 735) had appeared in 1892 (and which Husserl mentions in the selection reprinted here), though objecting forcefully that allowing questions of reference (and thereby empirical verifiability) to preempt the field of the study of meaning would impose a crippling burden upon the philosophical examination of conscious insight, which clearly ranges much more freely than Frege's model would allow. Since Frege, however, was primarily concerned in that essay with the logical problem of equality, the connection between his work and Husserl's, in this particular, is not widely discussed. What is particularly interesting, however, is how many developments Husserl anticipated, including a mild prediction of trouble ahead for strict formalism—which came, for Frege, in 1902, with Bertrand Russell's devastating detection of an unsolvable contradiction in Frege's *Begriffsschrift* and the logical system developed from it, now popularly known as "Russell's Paradox" (below, page 811)—but also an anticipation of Wittgenstein's "picture theory of meaning" as well as a striking critique of its insufficiency that corresponds quite well with Wittgenstein's own later development of the idea of the "language game."[2] In a similar way, Husserl's work on signs predates Saussure (below, page 786) and Ogden and Richards in *The Meaning of Meaning* (1923), just as it has certain resemblances to the less well known work of Peirce (above, page 652) whose own version of phenomenology Peirce called "Phanerscopy."[3]

The great difficulty in forming, in retrospect, an apposite view of Husserl is exacerbated by his own increasing commitment to a more and more stringently rationalist and Cartesian development of Phenomenology, which, as J. R. Findlay wryly notes, runs the risk of transforming "his brilliant, original analysis of consciousness into one of those ordinary subjectivisms that comfort the shattered ego by assuring it, quite baselessly, that in some secret manner it has manufactured its own shattering world."[4] In one respect, his pursuit of the project of Phenomenology, as a movement, seems to have had the effect of making it less and less possible for anyone else to follow it, but the brilliant analysis of consciousness to which Findlay alludes has been an enormously powerful influence, discernible in figures as disparate as Jean Paul Sartre (below, page 1175), his student, Martin Heidegger (below, page 1051), and two generations of phenomenological thinkers such as Maurice Merleau-Ponty (1908–1961), Gaston Bachelard (1884–1962), Georges Poulet (1902–1991), Paul Ricoeur (b. 1913), Emmanuel Lévinas (1906–1995), Paul de Man (below, page 1309), and Jacques Derrida (below, page 1203). In this respect, Husserl is all the more important, even when his influence is mediated or submerged, for mid-century literary criticism, more or less desperately starved for philosophical reflection, but finding analytical philosophy not well suited to literary and cultural investigations. Husserl was not just the originator of a movement, but the source of a style that seemed, on the face of it, far more congenial to the kind of subtle and supple explorations of meaning that literary texts demand. He is also, in a more deeply ironic way, a major source of a counter-style in deconstruction, evinced in the penetrating and lithe critique of Husserl (particularly the Husserl of *Logical Investigations*) by Jacques Derrida (a portion of which is reprinted below, page 1215).

---

[1] See *Logical Investigations* I, 245.

[2] See, for example, *Investigations* I, 305, where Husserl employs the same metaphor, though more directly to mathematical operations.

[3] Cf. *Collected Papers* 3.284: "Phaneroscopy is the description of the phaneron; and by the phaneron I mean the collective total of all that is in any way or in any sense present to the mind, quite regardless of whether it corresponds to any real thing or not. If you ask present when, and to whose mind, I reply that I leave these questions unanswered, never having entertained a doubt that those features of the phaneron that I have found in my mind are present at all times and to all minds."

[4] Translator's Introduction, *Logical Investigations* I, 10.

It remains to say that Husserl, from a Jewish background but who converted in the late 1880s to an evangelical Lutheran church, enjoyed through most of his long career the respect and admiration of an ever-growing group of philosophers and thinkers. After his appointment to the University of Freiburg in 1916, his international reputation continued to grow, but in the years after his retirement in 1928, he was humiliated by exclusion from the university after Hitler's rise to power in 1933, an exclusion made all the more bitter later in being enforced by his former student who succeeded him in his chair as professor of philosophy, Martin Heidegger.

An edition of Husserl's works in English translation is in progress, *Works,* vol. 1–9 (1980–2001), and the *Edmund Husserl Bibliography,* compiled by Steven Spileers, was published in 1998. Husserl's major works include: *The Philosophy of Arithmetic* (1891); *Logical Investigations* (1900, 1913; trans. 1970); *Cartesian Meditations: An Introduction to Phenomenology* (1929; trans. 1960); *Ideas: General Introduction to Pure Phenomenology* [Volume 1 of *Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie*] (trans. 1931); *The Idea of Phenomenology* (1907; trans. 1964); *Phenomenology and the Crisis of Philosophy* (1936, trans. 1965); and *The Phenomenology of Internal Time-Consciousness,* ed. Martin Heidegger (trans. 1964). Important critical studies include: Paul Ricoeur, *Husserl: An Analysis of His Phenomenology* (1967), and *A Key to Ideas I* (1996); Maurice Natanson, *Edmund Husserl: Philosopher of Infinite Tasks* (1973); Jacques Derrida, *Speech and Phenomena and Other Essays on Husserl's Theory of Signs* (1967; trans. 1973) and *The Problem of Genesis in Husserl's Philosophy* (2003); Barry Smith and David W. Smith, eds., *The Cambridge Companion to Husserl* (1995).

Investigation I: Expression and Meaning

Chapter One

Essential Distinctions

§1 An ambiguity in the term 'sign'

The terms 'expression' and 'sign' are often treated as synonyms, but it will not be amiss to point out that they do not always coincide in application in common usage. Every sign is a sign for something, but not every sign has 'meaning', a 'sense' that the sign 'expresses'. In many cases it is not even true that a sign 'stands for' that of which we may say it is a sign. And even where this can be said, one has to observe that 'standing for' will not count as the 'meaning' which characterizes the expression. For signs in the sense of indications (notes, marks etc.) *do not express* anything, unless they happen to fulfil a significant as well as an indicative function. If, as one unwillingly does, one limits oneself to expressions employed in living discourse, the notion of an indication seems to apply more widely than that of an expression, but this does not mean that its content is the genus of which an expression is the species. To mean is *not a particular way of being a sign in the sense of indicating something.* It has a narrower application only because meaning—in communicative speech—is always bound up with such an indicative relation, and this in its turn leads to a wider concept, since meaning is also capable of occuring without such a connection. *Expressions* function meaningfully even in *isolated mental life, where they no longer serve to indicate anything.* The two notions of sign do not therefore really stand in the relation of more extensive genus to narrower species.

The whole matter requires more thorough discussion.

§2 The essence of indication

Of the two concepts connected with the word 'sign', we shall first deal with that of an *indication.* The relation that here obtains we shall call the *indicative relation.* In this sense a brand is the sign of a slave, a flag the sign of a nation. Here all marks belong, as characteristic qualities suited to help us in recognizing the objects to which they attach.

But the concept of an indication extends more widely than that of a mark. We say the Martian canals are signs of the existence of intelligent beings on Mars, that fossil vertebrae are signs of the existence of prediluvian animals etc. Signs to aid memory, such as the much-used knot in a handkerchief, memorials etc., also have their place here. If suitable things, events or their properties are deliberately produced to serve as such indications, one calls them 'signs' whether they exercise this function or not. Only in the case of indications deliberately and artificially brought about, does one speak of standing for, and that both in respect of the action which produces the marking (the branding or chalking etc.), and in the sense of the indication itself, i.e. taken in its relation to the object it stands for or that it is to signify.

These distinctions and others like them do not deprive the concept of indication of its essential unity. A thing is only properly an indication if and where it in fact serves to indicate something to some thinking being. If we wish to seize the pervasively common element here present we must refer back to such cases of 'live' functioning. In these we discover as a common circumstance the fact that certain objects or states of affairs *of whose reality someone has actual knowledge* indicate to him *the reality of certain other objects or states of affairs,* in the sense that *his belief in the reality of the one is experienced* (though not at all evidently) *as motivating a belief or surmise in the reality of the other.* This relation of 'motivation' represents a *descriptive unity* among our acts of judgement in which indicating and indicated states of affairs become constituted for the thinker. This descriptive unity is not to be conceived as a mere form-quality founded upon our acts of judgement, for it is in their unity that the essence of indication lies. More lucidly put: the 'motivational' unity of our acts of judgement has itself the character of a unity of judgement; before it as a whole an objective correlate, a unitary state of affairs, parades itself, is meant in such a judgement, appears to be in and for that judgement. Plainly such a state of affairs amounts to just this: that certain things *may* or *must* exist, *since* other things have been given. This 'since', taken as expressing an objective connection, is the objective correlate of 'motivation' taken as a descriptively peculiar way of combining acts of judgement into a single act of judgement.

§3 Two senses of 'demonstration' (Hinweis und Beweis)

We have sketched the phenomenological situation so generally that what we have said applies as much to the

---

From *Investigation I: Expression and Meaning* was first published in 1900, in *Logische Untersuchungen.* Reprinted from *Logical Investigations,* translated by J. N. Findlay, from the Second German Edition (1913). (London: Routledge & Kegan Paul, 1970), Volume I, pages 269–311.

'demonstration' of genuine inference and proof, as to the 'demonstration' of indication. These two notions should, however, be kept apart. Their distinctness has already been suggested by our stress on the *lack of insight* in indications. In cases where the existence of one state of affairs is evidently inferred from that of another, we do not in fact speak of the latter as an indication or sign of the former, and, conversely, we only speak of demonstration in the strict logical sense in the case of an inference which is or could be informed by insight. Much, no doubt, that is propounded as demonstrative or, in the simplest case, as syllogistically cogent, is devoid of insight and may even be false. But to propound it is at least to make the claim that a relation of consequence could be seen to hold. This is bound up with the fact that there is an objective syllogism or proof, or an objective relationship between ground and consequent, which corresponds to our subjective acts of inferring and proving. These ideal unities are not the experiences of judging in question, but their ideal 'contents', the propositions they involve. The premisses prove the conclusion no matter who may affirm the premisses and the conclusion, or the unity that both form. An ideal rule is here revealed which extends its sway beyond the judgements here and now united by 'motivation'; in supra-empirical generality it comprehends as such all judgements having a like content, all judgements, even, having a like form. Such regularity makes itself subjectively known to us when we conduct proofs with insight, while the precise rule is made known to us through ideative reflection on the contents of the judgements experienced together in the actual context of 'motivation', in the actual inference and proof. These contents are the propositions involved.

In the case of an indication there is no question of all this. Here insight and (to put the matter objectively) knowledge regarding the ideal connections among the contents of the judgements concerned, is quite excluded. When one says that the state of affairs *A* indicates the state of affairs *B*, that the existence of the one points to that of the other, one may confidently be expecting to find *B* true, but one's mode of speech implies no objectively necessary connections between *A* and *B*, nothing into which one could have insight. The contents of one's judgements are not here related as premisses are to a conclusion. At times no doubt we do speak of 'indications' even in cases where there is an objective relation of entailment (a mediate one, in fact). A mathematician may make use (so he says) of the fact that an algebraic equation is of uneven order as a sign that it has at least one real root. To be more exact, we are here only concerned with the possibility that someone who fails to carry out and see the cogency of the relevant thought-chain, may make use of a statement about an equation's uneven order as an immediate, blind motive for asserting the equation to have some necessarily connected property which he needs for his mathematical purposes. In such situations, where certain states of affairs readily serve to indicate others which are, in themselves, their consequences, they do not function in thought as logical grounds of the latter, but work through connections which previous actual demonstration, or blind learning on authority, has established among our convictions, whether as actual mental states or as dispositions for such. Nothing is of course altered in all this by the possible presence of an accompanying merely habitual knowledge of an objectively present rational connection.

If an indication (or the connection of 'motivation' in which such a soi-disant objective relation makes its appearance) is without essential relation to a necessary connection, the question arises whether it may not claim to be essentially related to a connection of probability. Where one thing indicates another, where belief in the one's existence furnishes one with an empirical motive or ground—not necessary but contingent—for belief in the existence of the other, must the motivating belief not furnish a *ground of probability* for the belief it motivates? This is not the place for a close discussion of this pressing question. We need only observe that the question may correctly be answered in the affirmative in so far as such empirical 'motivations' all fall under an ideal jurisdiction in virtue of which they may be spoken of as 'justified' or 'unjustified', or, objectively expressed, in which they may be spoken of as real, i.e. valid, motivations which lead to a probability or perhaps to an empirical certainty, or *per contra*, as merely apparent, i.e. invalid, motivations, which do not lead to such a probability. One may, e.g., cite the controversy as to whether volcanic phenomena do or do not indicate that the earth's interior is molten, and so on. One thing is sure, that to talk of an indication is not to presuppose a definite relation to considerations of probability. Usually such talk relates not to mere surmises but to assured judgements. The ideal jurisdiction to which we have here accorded authority must first demand, therefore, that we should scale down our confident judgements to modest surmises.

I shall here observe, further, that we cannot avoid talking about 'motivation' in a general sense which covers strict demonstration as much as empirical indication. Here in fact we have a quite undeniable phenomenological affinity, obvious enough to register itself in ordinary discourse. We commonly speak of reasoning and inference, not merely in the sense of logic, but in a sense connected with empirical indications. This affinity plainly extends more widely: it covers the field of emotional, and, in particular, of volitional phenomena, to which talk of 'motives' was at first alone confined. Here too 'because' has a part to play, covering as wide a linguistic territory as does the most general sense of 'motivation'. I cannot therefore approve of Meinong's censure of Brentano's terminology, which I have here adopted.[1] But I entirely agree with him that in perceiving something as 'motivated' we are not at all perceiving it as caused.

§4 Digression on the associative origin of indication

The mental facts in which the notion of indication has its 'origin', i.e. in which it can be abstractively apprehended, belong to the wider group of facts which fall under the historical rubric of the 'association of ideas'. Under this rubric we do not merely have those facts which concern the 'accompaniment' and 'reactivation' of ideas stated in the laws of association, but the further facts in which association operates creatively, and produces peculiar descriptive characters and forms of unity.[2] Association does not merely restore contents to consciousness, and then leave it to them to combine with the contents there present, as the essence or generic nature of either may necessarily prescribe. It cannot indeed disturb such unified patterns as depend solely on our mental contents, e.g. the unity of visual contents in the visual field. But it can create additional phenomenological characters and unities which do not have their necessary, law-determined ground in the experienced contents themselves, nor in the generic forms of their abstract aspects.[3] If *A* summons *B* into consciousness, we are not merely simultaneously or successively conscious of both *A* and *B*, but we usually *feel* their connection forcing itself upon us, a connection in which the one points to the other and seems to belong to it. To turn mere coexistence into mutual pertinence, or, more precisely, to build cases of the former into intentional unities of things which seem mutually pertinent, is the constant result of associative functioning. All unity of experience, all empirical unity, whether of a thing, an event or of the order and relation of things, becomes a phenomenal unity through the felt mutual belongingness of the sides and parts that can be made to stand out as units in the apparent object before us. That one thing points to another, in definite arrangement and connection, is itself apparent to us. The single item itself, in these various forward and backward references, is no mere experienced content, but an apparent object (or part, property etc., of the same) that appears only in so far as experience *(Erfahrung)* endows contents with a new phenomenological *character,* so that they no longer count separately, but help to present an object different from themselves. In this field of facts the fact of indication also has its place, in virtue whereof an object or state of affairs not merely recalls another, and so points to it, but also provides evidence for the latter, fosters the presumption that it likewise exists, and makes us immediately feel this in the manner described above.

§5 Expressions as meaningful signs. Setting aside of a sense of 'expression' not relevant for our purpose

From indicative signs we distinguish *meaningful* signs, i.e. *expressions.* We thereby employ the term 'expression' restrictively: we exclude much that ordinary speech would call an 'expression' from its range of application. There are other cases in which we have thus to do violence to usage, where concepts for which only ambiguous terms exist call for a fixed terminology. We shall lay down, for provisional intelligibility, that each instance or part of *speech,* as also each sign that is essentially of the same sort, shall count as an expression, whether or not such speech is actually uttered, or addressed with communicative intent to any persons or not. Such a definition excludes facial expression and the various gestures which involuntarily accompany speech without communicative intent, or those in which a man's mental states achieve understandable 'expression' for his environment, without the added help of speech. Such 'utterances' are not expressions in the sense in which a case of speech is an expression, they are not phenomenally one with the experiences made manifest in them in the consciousness of the man who manifests them, as is the case with speech. In such manifestations one man communicates nothing to another: their utterance involves no intent to put certain 'thoughts' on record expressively, whether for the man himself, in his solitary state, or for others. Such 'expressions', in short, have properly speaking, *no meaning.* It is not to the point that another person may interpret our involuntary manifestations, e.g. our 'expressive movements', and that he may thereby become deeply acquainted with our inner thoughts and emotions. They 'mean' something to him in so far as he interprets them, but even for him they are without meaning in the special sense in which verbal signs have meaning: they only mean in the sense of indicating.

---

[1] [Husserl] A. V. Meinong, *Göttinger gel. Anz.* (1892), p. 446. [A. Alexius von Handschuchsheim Meinong (1853–1920), German philosopher and psychologist.]

[2] [Husserl] To use personification and to talk of association as 'creating' something, and to employ other similar figurative expressions in common use, is too convenient to be abandoned. Important as a scientifically exact but circumlocutory description of the relevant facts may be, ready understanding absolutely requires that we talk figuratively wherever ultimate exactness is not needed.

[3] [Husserl] I talk above of 'experienced contents', not of meant, apparent objects or events. Everything that really helps to constitute the individual, 'experiencing' consciousness is an experienced content. What it perceives, remembers, inwardly presents etc., is a meant or intentional object. This point will be further discussed in Investigation V.

In the treatment which follows these distinctions must be raised to complete conceptual clarity.

§6 Questions as to the phenomenological and intentional distinctions which pertain to expressions as such

It is usual to distinguish two things in regard to every expression: 1. The expression physically regarded (the sensible sign, the articulate sound-complex, the written sign on paper etc.); 2. A certain sequence of mental states, associatively linked with the expression, which make it be the expression of something. These mental states are generally called the 'sense' or the 'meaning' of the expression, this being taken to be in accord with what these words ordinarily mean. But we shall see this notion to be mistaken, and that a mere distinction between physical signs and sense-giving experiences is by no means enough, and not at all enough for logical purposes.

The points here made have long been observed in the special case of names. We distinguish, in the case of each name, between what it 'shows forth' (i.e. mental states) and what it means. And again between what it means (the sense or 'content' of its naming presentation) and what it names (the object of that presentation). We shall need similar distinctions in the case of all expression, and shall have to explore their nature precisely. Such distinctions have led to our distinction between the notions of 'expression' and 'indication', which is not in conflict with the fact that an expression in living speech also functions as an indication, a point soon to come up for discussion. To these distinctions other important ones will be added which will concern the relations between meaning and the intuition which illustrates meaning and on occasion renders it evident. Only by paying heed to these relations, can the concept of meaning be clearly delimited, and can the fundamental opposition between the symbolic and the epistemological function of meanings be worked out.

§7 Expressions as they function in communication

Expressions were originally framed to fulfil a communicative function: let us, accordingly, first study expressions in this function, so that we may be able to work out their essential logical distinctions. The articulate sound-complex, the written sign etc., first becomes a spoken word or communicative bit of speech, when a speaker produces it with the intention of 'expressing himself about something' through its means; he must endow it with a sense in certain acts of mind, a sense he desires to share with his auditors. Such sharing becomes a possibility if the auditor also understands the speaker's intention. He does this inasmuch as he takes the speaker to be a person, who is not merely uttering sounds but *speaking to him,* who is accompanying those sounds with certain sense-giving acts, which the sounds reveal to the hearer, or whose sense they seek to communicate to him. What first makes mental commerce possible, and turns connected speech into discourse, lies in the correlation among the corresponding physical and mental experiences of communicating persons which is effected by the physical side of speech. Speaking and hearing, intimation of mental states through speaking and reception thereof in hearing, are mutually correlated.

If one surveys these interconnections, one sees at once that all expressions in *communicative* speech function as *indications.* They serve the hearer as signs of the 'thoughts' of the speaker, i.e. of his sense-giving inner experiences, as well as of the other inner experiences which are part of his communicative intention. This function of verbal expressions we shall call their *intimating function.* The content of such intimation consists in the inner experiences intimated. The sense of the predicate 'intimated' can be understood more narrowly or more widely. The *narrower* sense we may restrict to *acts which impart sense,* while the *wider* sense will cover *all* acts that a hearer may introject into a speaker on the basis of what he says (possibly because he tells us of such acts). If, e.g., we state a wish, our judgement concerning that wish is what we intimate in the narrower sense of the word, whereas the wish itself is intimated in the wider sense. The same holds of an ordinary statement of perception, which the hearer forthwith takes to belong to some actual perception. The act of perception is there intimated in the wider sense, the judgement built upon it in the narrower sense. We at once see that ordinary speech permits us to call an experience which is intimated an experience which is *expressed.*

To understand an intimation is not to have conceptual knowledge of it, not to judge in the sense of asserting anything about it: it consists simply in the fact that the hearer *intuitively* takes the speaker to be a person who is expressing this or that, or as we certainly can say, *perceives* him as such. When I listen to someone, I perceive him as a speaker, I hear him recounting, demonstrating, doubting, wishing etc. The hearer perceives the intimation in the same sense in which he perceives the intimating person—even though the mental phenomena which make him a person cannot fall, for what they are, in the intuitive grasp of another. Common speech credits us with percepts even of other people's inner experiences; we 'see' their anger, their pain etc. Such talk is quite correct, as long as, e.g., we allow outward bodily things likewise to count as perceived, and as long as, in general the notion of perception is not restricted to the adequate, the strictly intuitive percept. If the essential mark of perception lies in the intuitive persuasion that a thing or event is itself before us for our grasping—such a persuasion is possible, and in the main mass of cases actual, without verbalized, conceptual apprehension—then the receipt of such an intimation is the mere perceiving of it. The essential distinction just touched on is of course present here. The hearer perceives the speaker as manifesting certain inner experiences, and to that extent he also perceives these experiences themselves: he does not, however, himself experience them, he has not an 'inner' but an 'outer' percept of them. Here we have the big difference between the real grasp of what is inadequate intuition, and the putative grasp of what is on a basis of inadequate, though intuitive, presentation. In the former case we have to do with an experienced, in the latter case with a presumed being, to which no truth corresponds at all. Mutual understanding demands a certain correlation among the mental acts mutually unfolded in intimation and in the receipt of such intimation, but not at all their exact resemblance.

§8 Expressions in solitary life

So far we have considered expressions as used in communication, which last depends essentially on the fact that they operate indicatively. But expressions also play a great part in uncommunicated, interior mental life. This change in function plainly has nothing to do with whatever makes an expression an expression. Expressions continue to have meanings as they had before, and the same meanings as in dialogue. A word only ceases to be a word when our interest stops at its sensory contour, when it becomes a mere sound-pattern. But when we live in the understanding of a word, it expresses something and the same thing, whether we address it to anyone or not.

It seems clear, therefore, that an expression's meaning, and whatever else pertains to it essentially, cannot coincide with its feats of intimation. Or shall we say that, even in solitary mental life, one still uses expressions to intimate something, though not to a second person? Shall one say that in soliloquy one speaks to oneself, and employs words as signs, i.e. as indications, of one's own inner experiences? I cannot think such a view acceptable. Words function as signs here as they do everywhere else: everywhere they can be said to point to something. But if we reflect on the relation of expression to meaning, and to this end break up our complex, intimately unified experience of the sense-filled expression, into the two factors of word and sense, the word comes before us as intrinsically indifferent, whereas the sense seems the thing aimed at by the verbal sign and meant by its means: the expression seems to direct interest away from itself towards its sense, and to point to the latter. But this pointing is not an indication in the sense previously discussed. The existence of the sign neither 'motivates' the existence of the meaning, nor, properly expressed, our belief in the meaning's existence. What we are to use as an indication, must be perceived by us as existent. This holds also of expressions used in communication, but not for expressions used in soliloquy, where we are in general content with imagined rather than with actual words. In imagination a spoken or printed word floats before us, though in reality it has no existence. We should not, however, confuse imaginative presentations, and the image-contents they rest on, with their imagined objects. The imagined verbal sound, or the imagined printed word, does not exist, only its imaginative presentation does so. The difference is the difference between imagined centaurs and the imagination of such beings. The word's nonexistence neither disturbs nor interests us, since it leaves the word's expressive function unaffected. Where it *does* make a difference is where intimation is linked with meaning. Here thought must not be merely expressed as meaning, but must be communicated and intimated. We can only do the latter where we actually speak and hear.

One of course speaks, in a certain sense, even in soliloquy, and it is certainly possible to think of oneself as speaking, and even as speaking to oneself, as, e.g., when someone says to himself: 'You have gone wrong, you can't go on like that.' But in the genuine sense of communication, there is no speech in such cases, nor does one tell oneself anything: one merely conceives of oneself as speaking and communicating. In a monologue words can perform no function of indicating the existence of mental acts, since such indication would there be quite purposeless. For the acts in question are themselves experienced by us at that very moment.

§9 Phenomenological distinctions between the phenomena of physical expression and the sense-giving and sense-fulfilling act

If we now turn from experiences specially concerned with intimation, and consider expressions in respect of distinctions that pertain to them equally whether they occur in dialogue or soliloquy, two things seem to be left over: the expressions themselves, and what they express as their meaning or sense. Several relations are, however, intertwined at this point, and talk about 'meaning', or about 'what is expressed', is correspondingly ambiguous. If we seek a foothold in pure description, the concrete phenomenon of the sense-informed expression breaks up, on the one hand, into the *physical phenomenon* forming the physical side of the expression, and, on the other hand, into the *acts* which give it *meaning* and possibly also *intuitive fulness,* in which its relation to an expressed object is constituted. In virtue of such acts, the expression is more than a merely sounded word. It *means* something, and in so far as it means something, it relates to what is objective. This objective somewhat can either be actually present through accompanying intuitions, or may at least appear in representation, e.g. in a mental image, and where this happens the relation to an object is realized. Alternatively this need not occur: the expression functions significantly, it remains more than mere sound of words, but it lacks any basic intuition that will give it its object. The relation of expression to object is now unrealized as being confined to a mere meaning-intention. A *name,* e.g., names its object whatever the circumstances, in so far as it *means* that object. But if the object is not intuitively before one, and so not before one as a named or meant object, mere meaning is all there is to it. If the originally *empty* meaning-intention is now fulfilled, the relation to an object is realized, the naming becomes an actual, conscious relation between name and object named.

Let us take our stand on this fundamental distinction between meaning-intentions void of intuition and those which are intuitively fulfilled: if we leave aside the sensuous acts in which the expression, *qua* mere sound of words, makes its appearance, we shall have to distinguish between two acts or sets of acts. We shall, on the one hand, have acts essential to the expression if it is to be an expression at all, i.e. a verbal sound infused with sense. These acts we shall call the *meaning-conferring acts* or the *meaning-intentions.* But we shall, on the other hand, have acts, not essential to the expression as such, which stand to it in the logically basic relation of *fulfilling* (confirming, illustrating) it more or less adequately, and so actualizing its relation to its object. These acts, which become fused with the meaning-conferring acts in the unity of knowledge or fulfilment, we call the *meaning-fulfilling* acts. The briefer expression 'meaning-fulfilment' can only be used in cases where there is no risk of the ready confusion with the *whole* experience in which a meaning-intention finds fulfilment in its correlated intuition. In the realized relation of the expression to its objective correlate,[4] the sense-informed expression becomes one with the act of meaning-fulfilment. The sounded word is first made one with the meaning-intention, and this in its turn is made one (as intentions in general are made one with their fulfilments) with its corresponding meaning-fulfilment. The word 'expression' is normally understood—wherever, that is, we do not speak of a 'mere' expression—as the *sense-informed* expression. One should not, therefore, properly say (as one often does) that an expression *expresses its meaning* (its intention). One might more properly adopt the alternative way of speaking according to which the *fulfilling act* appears as *the act expressed by the complete expression:* we may, e.g., say, that a statement 'gives expression' to an act of perceiving or imagining. We need not here point out that both meaning-conferring and meaning-fulfilling acts have a part to play in intimation in the case of communicative discourse. The former in fact constitute the inmost core of intimation. To make them known to the hearer is the prime aim of our communicative intention, for only in so far as the hearer attributes them to the speaker will he understand the latter.

§10 The phenomenological unity of these acts

The above distinguished acts involving the expression's appearance, on the one hand, and the meaning-intention and possible meaning-fulfilment, on the other, do not constitute a mere aggregate of simultaneously given items in consciousness. They rather form an intimately fused unity of peculiar character. Everyone's personal experience bears witness to the differing weight of the two constituents, which reflects the asymmetry of the relation between an expression and the object which (through its meaning) it expresses or names. Both are 'lived through', the presentation of the word and the sense-giving act: but, while we experience the former, we do not live *in* such a presentation at all, but solely in enacting its sense, its meaning. And in so far as we do this, and yield ourselves to enacting the meaning-intention and its further fulfilment, our whole interest centres upon the object intended in our intention, and named by its means. (These two ways of speaking have in fact the same meaning.) The function of a word (or rather of an intuitive word-presentation) is to awaken a sense-conferring act in ourselves, to point to what is intended, or perhaps given intuitive fulfilment in this act, and to guide our interest exclusively in this direction.

---

[4] [Husserl] I often make use of the vaguer expression 'objective correlate' *(Gegenständlichkeit)* since we are here never limited to objects in the narrower sense, but have also to do with states of affairs, properties, and non-independent forms etc., whether real or categorial. —

Such pointing is not to be described as the mere objective fact of a regular diversion of interest from one thing to another. The fact that two presented objects *A* and *B* are so linked by some secret psychological coordination that the presentation of *A* regularly arouses the presentation of *B*, and that interest is thereby shifted from *A* to *B*—such a fact does not make *A* the expression of the presentation of *B*. To be an expression is rather a descriptive aspect of the *experienced unity* of sign and thing signified.

What is involved in the descriptive difference between the physical sign-phenomenon and the meaning-intention which makes it into an expression, becomes most clear when we turn our attention to the sign *qua* sign, e.g. to the printed word as such. If we do this, we have an external percept (or external intuitive idea) just like any other, whose object loses its verbal character. If this object again functions as a word, its presentation is wholly altered in character. The word (*qua* external singular) remains intuitively present, maintains its appearance, but we no longer intend it, it no longer properly is the object of our 'mental activity.' Our interest, our intention, our thought—mere synonyms if taken in sufficiently wide senses—point exclusively to the thing meant in the sense-giving act. This means, phenomenologically speaking, that the intuitive presentation, in which the physical world-phenomenon is constituted, undergoes an essential phenomenal modification when its object begins to count as an *expression*. While what constitutes the object's appearing remains unchanged, the intentional character of the experience alters. There is constituted (without need of a fulfilling or illustrative intuition) an act of meaning which finds support in the verbal presentation's intuitive content, but which differs in essence from the intuitive intention directed upon the word itself. With this act, the new acts or act-complexes that we call 'fulfilling' acts or act-complexes are often peculiarly blended, acts whose object coincides with the object meant in the meaning, or named through this meaning.

In our next chapter we shall have to conduct additional researches into the question as to whether the 'meaning-intention', which on our view characteristically marks off an expression from empty 'sound of words' consists in the mere association of mental imagery of the intended object with the sounded words, or at least necessarily involves such an act of fancy, or whether, on the other hand, mental imagery lies outside of the essence of an expression, and rather performs a fulfilling role, even if only of a partial, indirect or provisional character. In order not to blur the main outlines of our thought, we shall not here enter more deeply into phenomenological questions. In this whole investigation, we need only do as much phenomenology as is required to establish essential, primary distinctions.

The provisional description so far given will have shown how complex is the correct description of a phenomenological situation. Such complexity appears inevitable once we clearly see that all objects and relations among objects only are what they are for us, through acts of thought essentially different from them, in which they become present to us, in which they stand before us as unitary items that we *mean*. Where not the phenomenological, but the naïvely objective interest dominates, where we live in intentional acts without reflecting upon them, all talk of course becomes plain sailing and clear and devoid of circumlocution. One then, in our case, simply speaks of 'expression' and of 'what is expressed', of name and thing named, of the steering of attention from one to the other etc. But where the phenomenological interest dominates, we endure the hardship of having to describe phenomenological relationships which we may have experienced on countless occasions, but of which we were not normally conscious as objects, and we have also to do our describing with expressions framed to deal with objects whose appearance lies in the sphere of our normal interests.

§11 The ideal distinctions between (1) expression and meaning as ideal unities

We have so far considered 'the well-understood expression' as a concrete experience. Instead of considering its two types of factor, the phenomenal expression and the sense-conferring or sense-fulfilling experience, we wish to consider what is, in a certain fashion, given 'in' these: the expression itself, its sense and its objective correlate. We turn therefore from the real relation of acts to the ideal relation of their objects or contents. A subjective treatment yields to one that is objective. The ideality of the relationship between expression and meaning is at once plain in regard to both its sides, inasmuch as, when we ask for the meaning of an expression, e.g. 'quadratic remainder', we are naturally not referring to the sound-pattern uttered here and now, the vanishing noise that can never recur identically: we mean the expression *in specie*. 'Quadratic remainder' is the same expression by whomsoever uttered. The same holds of talk about the expression's meaning, which naturally does not refer to some meaning-conferring experience.

Every example shows that an essential distinction must here be drawn.

If I sincerely say—we shall always presume sincerity—'The three perpendiculars of a triangle intersect in a point', this is of course based on the fact that I judge so. If someone hears me and understands my assertion, he likewise knows this fact; he 'apperceives' me as someone who judges thus. But is the judging here *intimated* the meaning of my assertion, is it what my assertion asserts, and in that sense expresses? Plainly not. It would hardly occur to anyone, if asked as to the sense or meaning of my assertion, to revert to my judgement as an inner experience. Everyone would rather reply by saying: What this assertion asserts is *the same* whoever may assert it, and on whatever occasion or in whatever circumstances he may assert it, and what it asserts is precisely this, *that the three perpendiculars of a triangle intersect in a point,* no more and no less. One therefore repeats what is in essence 'the same' assertion, and one repeats it because it is the one, uniquely adequate way of expressing the same thing, i.e. its meaning. In this selfsame meaning, of whose identity we are conscious whenever we repeat the statement, nothing at all about judging or about one who judges is discoverable. We thought we were sure that a state of affairs held or obtained objectively, and what, we were sure of we expressed by way of a declarative sentence. The state of affairs is what it is whether we assert that it obtains or not. It is intrinsically an item, a unity, which is capable of so obtaining or holding. But such an obtaining is what appeared before us, and we set it forth as it appeared before us: we said 'So the matter is'. Naturally we could not have done this, we could not have made the assertion, if the matter had not so appeared before us, if, in other words, we had not so judged. This forms part of an assertion as a psychological fact, it is involved in its intimation. But only in such intimation; for while what is intimated consists in inner experiences, what we assert in the judgement involves nothing subjective. My act of judging is a transient experience: it arises and passes away. But what my assertion asserts, the content *that the three perpendiculars of a triangle intersect in a point,* neither arises nor passes away. It is an identity in the strict sense, one and the same geometrical truth.

It is the same in the case of all assertions, even if what they assert is false and absurd. Even in such cases we distinguish their ideal content from the transient acts or affirming and asserting it: it is the meaning of the assertion, a unity in plurality. We continue to recognize its identity of intention in evident acts of reflection: we do not arbitrarily attribute it to our assertions, but discover it in them.

If 'possibility' or 'truth' is lacking, an assertion's intention can only be carried out symbolically: it cannot derive any 'fulness' from intuition or from the categorial functions performed on the latter, in which 'fulness' its value for knowledge consists. It then lacks, as one says, a 'true', a 'genuine' meaning. Later we shall look more closely into this distinction between intending and fulfilling meaning. To characterize the various acts in which the relevant ideal unities are constituted, and to throw light on the essence of their actual 'coincidence' in knowledge, will call for difficult, comprehensive studies. It is plain, however, that each assertion, whether representing an exercise of knowledge or not—whether or not, i.e., it fulfils or can fulfil its intention in corresponding intuitions, and the formative acts involved in these—involves a thought, in which thought, as its unified specific character, its meaning is constituted.

It is this ideal unity men have in mind when they say that 'the' judgement is the meaning of 'the' declarative sentence. Only the fundamental ambiguity of the word 'judgement' at once tends to confuse the evidently grasped ideal unity with the real act of judging, to confuse what the assertion intimates with what it asserts.

What we have here said of complete assertions readily applies also to actual or possible parts of assertions. If I judge *If the sum of the angles in a triangle does not equal two right angles, the axiom of parallels does not hold,* the hypothetical antecedent is no assertion, for I do not say that such an inequation holds. None the less it says something, and what it says is once more quite different from what it intimates. What it says is not my mental act of hypothetical presumption, though I must of course have performed this in order to speak sincerely as I do. But it is rather the case that, when this subjective act is intimated, something objective and ideal is brought to expression: the hypothesis whose conceptual content can appear as the same intentional unity in many possible thought-experiences, and which evidently stands before us in its unity and identity in the objectively-ideal treatment characteristic of all thinking.

The same holds of the other parts of our statements, even of such as do not have the form of propositions.

§12 Continuation: the objective correlate of an expression

Talk of *what an expression expresses* has, in the discussion so far, several essentially different meanings. It relates, *on the one hand,* to intimation in general, and especially in that connection to sense-giving acts, at times also to sense-fulfilling acts (if these are present at all). In an assertion, e.g., we express our judgement (we intimate it), but we also express percepts and other sense-fulfilling acts which illustrate our assertion's meaning. *On the other hand,* such talk relates to the 'contents' of such acts, and primarily to the meanings, which are often enough said to be 'expressed'.

It is doubtful whether the examples analysed, in our last section, would suffice even to lend provisional intelligibility to the notion of meaning, if one could not forthwith introduce a new sense of 'expression' for purposes of comparison. The terms 'meaning', 'content', 'state of affairs' and all similar terms harbour such powerful equivocations that our intention, even if expressed most carefully, still can promote misunderstanding. The third sense of 'being expressed', which we must now discuss, concerns the *objective correlate* meant by a meaning and expressed by its means.

Each expression not merely says something, but says it *of* something: it not only has a meaning, but refers to certain *objects*. This relation sometimes holds in the plural for one and the same expression. But the object never coincides with the meaning. Both, of course, only pertain to an expression in virtue of the mental acts which give it sense. And, if we distinguish between 'content' and object in respect of such 'presentations', one's distinction means the same as the distinction between what is meant or said, on the one hand, and what is spoken of, by means of the expression, on the other.

The necessity of distinguishing between meaning (content) and object becomes clear when a comparison of examples shows us that several expressions may have the same meaning but different objects, and again that they may have different meaning but the same object. There is of course also the possibility of their differing in both respects and agreeing in both. The last occurs in the cases of synonymous expression, e.g. the corresponding expressions in different languages which mean and name the same thing ('London', 'Londres'; 'zwei', 'deux', 'duo' etc.).

Names offer the plainest examples of the separation of meaning from the relation to objects, this relation being in their case usually spoken of as 'naming'. Two names can differ in meaning but can name the same object, e.g. 'the victor at Jena'—'the vanquished at Waterloo'; 'the equilateral triangle'—'the equiangular triangle'. The meaning expressed in our pairs of names is plainly different, though the same object is meant in each case. The same applies to names whose indefiniteness gives them an 'extension'. The expressions 'an equilateral triangle' and 'an equiangular triangle' have the same objective reference, the same range of possible application.

It can happen, conversely, that two expressions have the same meaning but a different objective reference. The expression 'a horse' has the same meaning in whatever context it occurs. But if on one occasion we say 'Bucephalus is a horse', and on another 'That cart-horse is a horse', there has been a plain change in our sense-giving presentation in passing from the one statement to the other. The expression 'a horse' employs the same meaning to present Bucephalus on one occasion and the cart-horse on the other. It is thus with all general names, i.e. names with an 'extension'. 'One' is a name whose meaning never differs, but one should not, for that reason, identify the various 'ones' which occur in a sum: they all mean the same, but they differ in objective reference.

The case of proper names is different, whether they name individual or general objects. A word like 'Socrates' can only name different things by meaning different things, i.e. by becoming *equivocal*. Wherever the word has *one* meaning, it also names *one* object. The same holds of expressions like 'the number two', 'redness' etc. We therefore distinguish equivocal names that have *many meanings* from general or class-names that have *many values*.

The same holds of other types of expression, though in their case talk of objective reference involves certain difficulties in virtue of its manifoldness. If we consider, e.g., statements of the form '*S* is *P*' we generally regard the subject of the statement as the object about which the statement is made. Another view is, however, possible, which treats the *whole* state of affairs which corresponds to the statement as an analogue of the object a name names, and distinguishes this from the object's meaning. If this is done one can quote as examples pairs of sentences such as '*a* is bigger than *b*'—'*b* is smaller than *a*', which plainly say different things. They are not merely grammatically but also 'cogitatively' different, i.e. different in meaning-content. But they express the same state of affairs: the same 'matter' is predicatively apprehended and asserted in two different ways. Whether we define talk of the 'object' of a statement in one sense or the other—each has its own claims—statements are in either case possible which differ in meaning while referring to the same object.

§13 Connection between meaning and objective reference

Our examples entitle us to regard the distinction between an expression's meaning and its power to direct itself as a name to this or that objective correlate—and of course the distinction between meaning and object itself—as well-established. It is clear for the rest that the sides to be distinguished in each expression are closely connected: an expression only refers to an objective correlate *because* it means something, it can be rightly said to signify or name the object *through* its meaning. An act of meaning is the determinate manner in which we refer to our object of the moment, though this mode of significant reference and the meaning itself can change while the objective reference remains fixed.

A more profound phenomenological clarification of this relation can be reached only by research into the way expressions and their meaning-intentions function in knowledge. This would show that talk about *two distinguishable sides* to each expression, should not be taken seriously, that the essence of an expression lies solely in its meaning. But the same intuition (as we shall show later) can offer fulfillment of different expressions: it can be categorically apprehended in varying ways and synthetically linked with other intuitions. Expressions and their meaning-intentions do not take their measure, in contexts of thought and knowledge, from mere intuition—I mean phenomena of external or internal sensibility—but from the varying intellectual forms through which intuited objects first become intelligibly determined, mutually related objects. And so expressions, even when they function outside of knowledge, must, as symbolic intentions, point to categorically *formed* unities. Different meanings may therefore pertain to the same intuitions regarded in differing categorical fashion, and may therefore also pertain to the same object. But where a whole range of objects corresponds to a single meaning, this meaning's own essence must be *indeterminate:* it must permit a sphere of possible fulfilment.

These indications may suffice for the moment. They must guard in advance against the error of seriously thinking that sense-giving acts have two distinct sides, one which gives them their meaning, while the other gives them their determinate direction to objects.[5]

§14 Content as object, content as fulfilling sense and content as sense or meaning simpliciter

Relational talk of 'intimation', 'meaning' and 'object' belongs *essentially* to every expression. Every expression intimates something, means something and names or otherwise designates something. In each case, talk of 'expression' is equivocal. As said above, relation to an actually given objective correlate, which fulfils the meaning-intention, is *not* essential to an expression. If this last important case is also taken into consideration, we note that there are two things that can be said to be expressed in the realized relation to the object. We have, on the one hand, the *object itself,* and the object as meant in this or that manner. On the other hand, and more properly, we have the object's ideal correlate in the acts of meaning-fulfilment which constitute it, *the fulfilling sense.* Wherever the meaning-intention is fulfilled in a corresponding intuition, i.e. wherever the expression actually serves to name a given object, there the object is constituted as one 'given' in certain acts, and, to the extent that our expression really measures up to the intuitive data, as given *in the same manner* in which the expression *means* it. In this unity of coincidence between meaning and meaning-fulfilment, the essence of the meaning-fulfilment corresponds with, and is correlative, to the essence of meaning: the essence of the meaning-fulfilment is the *fulfilling* sense of the expression, or, as one may also call it, the sense expressed by the expression. One says, e.g., that a statement of perception expresses a perception, but also that it expresses the *content* of a perception. We distinguish, in a perceptual statement, as in every statement, between *content* and *object;* by the 'content' we understand the self-identical meaning that the hearer can grasp even if he is not a percipient. We must draw the same distinction in the case of fulfilling acts, in the case, therefore, of perceptions and their categorial formations. Through these acts the objective correlate of our act of meaning stands before us intuitively as the very object we mean. We must, I say, distinguish again, in such fulfilling acts, between their *content,* the meaning-element, as it were, in the categorially formed percept, and the *object* perceived. In the unity of fulfilment, the fulfilling content coincides with the intending content, so that, in our experience of this unity of coincidence, the object, at once intended and 'given', stands before us, not as two objects, but as *one* alone. The ideal conception of the act which *confers meaning* yields us the Idea of the *intending meaning,* just as the ideal conception of the correlative essence of the act which *fulfils* meaning, yields the *fulfilling meaning,* likewise *qua* Idea. This is the *identical content* which, in perception, pertains to the totality of possible acts of perception which intended the same object perceptually, and intend it actually as the same object. This content is therefore the ideal correlate of this *single* object, which may, for the rest, be completely imaginary.

The manifold ambiguities in talk about what an expression expresses, or about an *expressed content,* may therefore be so ordered that one distinguishes between a content in a *subjective,* and a content in an *objective* sense. In the latter respect we must distinguish between:

> The content as intending sense, or as sense, *meaning simpliciter,* the content as fulfilling sense, and the content as object.

§15 The equivocations in talk of meaning and meaninglessness connected with these distinctions

The application of the terms 'meaning' and 'sense', not merely to the content of the meaning-intention inseparable from the expression, but also to the content of the meaning-fulfilment, engenders a most unwelcome ambiguity. It is clear from previous indications, where we dealt with the fact of fulfilment, that the acts on either side, in which intending and fulfilling sense are constituted, need not be the same. What tempts us to transfer the same terms from intention to fulfilment, is the peculiar way in which the unity of fulfilment is a unity of identification or coincidence: the equivocation which one hoped a modifying adjective might render innocuous, can scarcely be avoided. We shall continue, of course, to understand by 'meaning' *simpliciter* the meaning which, as the identical element in our intention, is essential to the expressions as such.

---

[5] [Husserl] Cf. with this Twardowski's assumption of a 'presentative activity moving in two directions' in his work *Zur Lehre vom Inhalt und Gegenstand der Vorstellungen* (Vienna, 1894), p. 14. [Kasimir Twardowski (1866–1938), Russian-German psychologist and philosopher.]

'Meaning' is further used by us as synonymous with 'sense'. It is agreeable to have parallel, interchangeable terms in the case of this concept, particularly since the sense of the term 'meaning' is itself to be investigated. A further consideration is our ingrained tendency to use the two words as synonymous, a circumstance which makes it seem rather a dubious step if their meanings are differentiated, and if (as G. Frege has proposed)[6] we use one for meaning in our sense, and the other for the objects expressed. To this we may add that both terms are exposed to the same equivocations, which we distinguished above in connection with the term 'expression', and to many more besides, and that this is so both in scientific and in ordinary speech. Logical clarity is much impaired by the manner in which the sense or meaning of an expression is, often in the same thought-sequence, now looked upon as the acts intimated by it, now as its ideal sense, now as the objective correlate that it expresses. Since fixed terminological landmarks are lacking, the concepts themselves run confusedly into one another.

Fundamental confusions arise from these facts. General and equivocal names are, e.g., repeatedly lumped together, since both can be predicatively referred to a plurality of objects. Lacking fixed concepts, men did not know how to distinguish the *multiple senses* of the equivocal names from the *multiple values* of the general ones. Here we also meet with the frequent unclearness as to the true essence of the difference between collective and general names. For, where collective meanings are fulfilled, we intuit a plurality of items: fulfilment is articulated into a plurality of individual intuitions, and so, if intention and fulfilment are not kept apart, it may well seem that the collective expression in question has many meanings.

It is more important for us to set forth precisely the most detrimental equivocations in talk which concerns *meaning* and *sense,* on the one hand, or *meaningless* or *senseless* expressions, on the other. If we separate the blurred concepts, the following list emerges:

1. It is part of the notion of an expression to have a meaning: this precisely differentiates an expression from the other signs mentioned above. A meaningless expression is, therefore, properly speaking, no expression at all: it is at best something that claims or seems to be an expression, though, more closely considered, it is not one at all. Here belong articulate, word-like sound-patterns such as 'Abracadabra', and also combinations of genuine expressions to which no unified meaning corresponds, though their outer form seems to pretend to such a meaning, e.g. 'Green is or'.

2. In meaning, a relation to an object is constituted. To use an expression significantly, and to refer expressively to an object (to form a presentation of it), are one and the same. It makes no difference whether the object exists or is fictitious or even impossible. But if one gives a very rigorous interpretation to the proposition that an expression, in so far as it has meaning, relates to an object, i.e. in a sense which involves the existence of the object, then an expression has *meaning* when an object corresponding to it exists, and it is *meaningless* when no such object exists. Meanings are often spoken of as signifying the *objects* meant, a usage that can scarcely be maintained consistently, as it springs from a confusion with the genuine concept of meaning.

3. If the meaning is identified with the objective correlate of an expression, a name like 'golden mountain' is meaningless. Here men generally distinguish objectlessness from meaninglessness. As opposed to this, men tend to use the word 'senseless' of expressions infected with contradiction and obvious incompatibilities, e.g. 'round square', or to deny them meaning by some equivalent phrase. Sigwart,[7] e.g., says that a self-contradictory formula such as 'square circle' expresses no concept we can think, but that it uses words to set up an insoluble task. The existential proposition 'There is no square circle', on his view denies the possibility of connecting a concept with these words, and by a concept he expressly wants us to understand (if we get him right) the 'general meaning of a word', which is just what we mean by it. Erdmann[8] has similar opinions in regard to the instance 'A square circle is frivolous'. We should, in consistency, have to apply the word 'senseless', not merely to expressions immediately

absurd, but to those whose absurdity is mediate, i.e. the countless expressions shown by mathematicians, in lengthy indirect demonstrations, to be objectless *a priori.* We should likewise have to deny that concepts like *regular decahedron* etc., are concepts at all.

Marty raises the following objection to the thinkers just mentioned. 'If the words are senseless, how could we understand the question as to whether such things exist, so as to answer it negatively? Even to reject such an existence, we must, it is plain, somehow form a presentation of such contradictory material'[9] . . . 'If such absurdities are called senseless, this can only mean that they have no rational sense'.[10] These objections are clinching, in so far as these thinkers' statements suggest that they are confusing the true meaninglessness mentioned above under 1, with another quite different meaninglessness, i.e. *the* a priori *impossibility of a fulfilling sense.* An expression has meaning in this sense if a possible fulfilment, i.e. the possibility of a unified intuitive illustration, corresponds to its intention. This possibility is plainly meant ideally. It concerns no contingent acts of expression or fulfilment, but their ideal contents: meaning as an ideal unity, here to be called 'intending meaning', on the one hand, and fulfilling meaning, standing to it in a certain relation of precise adequacy, on the other. We apprehend this ideal relation by ideative abstraction based on an act of unified fulfilment. In the contrary case we apprehend the real impossibility of meaning-fulfilment through an experience of the incompatibility of the partial meanings in the intended unity of fulfilment.

The phenomenological clarification of these relationships calls for long, difficult analyses, as will appear in a later investigation.

4. If we ask what an expression means, we naturally recur to cases where it actually contributes to knowledge, or, what is the same, where its meaning-intention is intuitively fulfilled. In this manner the 'notional presentation', i.e. the meaning-intention, gains clarity, it shows itself up as 'correct', as 'really' capable of execution. The draft it makes on intuition is as it were cashed. Since in the unity of fulfilment the act of intention coincides with the fulfilling act, and fuses with it in the most intimate fashion—if indeed there is any difference left over here at all—it readily seems as if the expression first got its meaning here, as if it drew meaning from the act of fulfilment. The tendency therefore arises to treat the *fulfilling intuitions*—categorially formative acts are here in general passed over—as meanings. But fulfilment is often imperfect—we shall have to devote closer study to all such possibilities—and expressions often go with remotely relevant, only partially illustrative intuitions, if with any at all. Since the phenomenological differences of these cases have not been closely considered, men have come to locate the significance of expressions, even of such as could make no claim to adequate fulfilment, in accompaniments of intuitive imagery. This naturally led to a total denial of meaning to absurd expressions.

The new concept of meaning therefore originates in a confusion of meaning with fulfilling intuition. On this conception, an expression has meaning if and only if its intention—we should say its 'meaning-intention'—is in fact fulfilled, even if only in a partial, distant and improper manner. The understanding of the expression must be given life through certain 'ideas of meaning' (it is commonly said), i.e. by certain *illustrative* images.

The final refutation of highly attractive, opposed notions is an important task which requires lengthy discussions. These we shall postpone to the next chapter, and here go on enumerating different concepts of meaning.

§16 Continuation: meaning and connotation

Another equivocation in our talk about meaninglessness was introduced by John Stuart Mill, and again rests on a new, fifth concept of meaning. He locates the essence of the meaning of names in their connotation, and therefore treats non-connotative names as meaningless. (Sometimes he says, more carefully but less clearly, that they are meaningless in the 'proper' or 'strict' sense.) It is well-known that by 'connotative names' Mill understands such as designate a subject and imply an attribute, by 'non-connotative names' such as designate a subject without (as it is here more clearly put) indicating an attribute as attaching to it.[11] Proper names are non-connotative and so too are names of attributes (e.g. 'whiteness'). Mill compares proper names to the distinctive chalk-marks which the robber, in the well-known tale from the *Arabian Nights,* made on the house.[12] And he goes on to say: 'When we impose a proper name, we perform an operation in some degree analogous to what the robber intended in chalking the house. We put a mark, not indeed upon the object itself, but upon the idea of the object. A proper name is but an unmeaning mark which we connect in our minds with the idea of the object, in order that whenever the mark meets our eyes or occurs to our thoughts, we may think of that individual object . . . When we predicate of anything its proper name; when we say, pointing to a man, this is Brown or Smith, or pointing to a city, this is York, we do not, merely by so doing, convey to the reader any information about them, except that those are their names . . . It is otherwise when objects are spoken of by connotative names. When we say, "The town is built of marble", we give the hearer what may be entirely new information, and this merely by the signification of the many-worded connotative name "built of marble". Such names . . . are not mere marks, but more, that is to say significant marks; and the connotation is what constitutes their significance.'[13]

[10] [Husserl] Ibid. p. 81 note. Cf. Art. V, Vol. xviii, p. 464.

[11] [Husserl] *Logic,* Book I, ch. 2, § 5. [John Stuart Mill (1806–1873), English philosopher, logician and writer. Husserl refers to Mill's *A System of Logic* (1843, 1872).]

[12] [Husserl] *System of Logic,* Book I, ch. 2, § 5.

If we set our own analyses alongside of these utterances of Mill's, we cannot help seeing that he confuses distinctions that should in principle be kept apart. Above all, he blurs the distinction between indicating and expressing. The chalk-mark of the robber is a mere indication, while a proper name is an expression.

Like every expression a proper name functions as an indication, i.e. in its intimating role. Here there is a real analogy with the robber's chalk-mark. If the robber sees the chalk-mark he knows: This is the house I must rob. If I hear a proper name uttered, the corresponding presentation is aroused in me, and I know: This is the presentation the speaker is framing in his mind, and that he likewise wishes to arouse in mine. A name, however, has an additional expressiveness to which the intimating function is merely auxiliary. A man's presentation is not of primary importance: we are not concerned to direct interest to it but to the *object* it presents, to what it *refers to* and therefore *names,* and to set this before us as such. In a statement it makes its first appearance as the object about which something is asserted, in a wish-sentence as the object about which something is wished etc. Only in order to perform this task will a proper name, like any other name, become an element in complex, unified expressions, in statements, wish-sentences and the like. But in its relation to its *object* the proper name is not an index. This is at once clear when we reflect on the fact that it is of the essence of an index to point to a fact, an existence, whereas the object named need not be taken to exist at all. When Mill extending his analogy, holds a proper name to be associated with the idea of the person it names in essentially the same manner as the chalk-mark is associated with the house, but *at once* adds that the point of the association is that we may *think* of the individual object whenever the sign meets our eye or enters our thought, his addition cracks the analogy wide asunder.

Mill correctly stresses the difference between names that are a means towards 'knowing' an object and names which are not, but neither this distinction, nor the equivalent distinction between connotative and non-connotative names, has anything to do with the distinction between the meaningful and the meaningless. The first-mentioned pair of differences are in fact not merely logically equivalent but identical. The difference is simply one of attributive and non-attributive names: to mediate the 'knowledge' of a thing and to mediate its attributes mean exactly the same. It is, no doubt, important, whether a name means a thing directly or only by way of the attributes that pertain to it. But this is a difference within the unitary genus Expression, just as the very important, parallel difference between nominal meanings (or logical 'presentations') which are attributive and those which are not attributive, is a difference within the unitary genus Meaning.

Mill *after a fashion* 'feels' the difference in question by being at times obliged to speak of a meaning of proper names in a sense contrasting with the 'strict' and 'proper' sense ascribed to the meaning of connotative names. He would have done better had he introduced a wholly new sense of meaning (though not, we may say, one to be recommended). The way, at least, in which the distinguished logician brings in his valuable distinction between connotative and non-connotative names has done much to confuse the quite different distinctions we have here been discussing.

One must note, further, that Mill's distinction between what a name *denotes* and what it *connotes* must not be confused with the merely cognate distinction between what a name *names* and what it *means*. This confusion is greatly aided by Mill's exposition.

How important all these distinctions are, and how little it helps to treat them with superficial contempt as being 'merely grammatical', will be shown in further investigations. These will make plain, we hope, that if one blurs the straightforward distinctions we have proposed, we cannot hope for a trustworthy elaboration of the concepts of Presentation and Judgement, in the sense relevant to logic.

---

[13] [Husserl] Op. cit., Book I, ch. 2, § 5.

Ferdinand de Saussure

1857–1913

Saussure is usually regarded as the founder of structuralist linguistics. His posthumously published *Course in General Linguistics* (1913) is a reconstruction by students of his lectures at the University of Geneva in the years 1906–1911. Saussure did not leave even notes for these lectures, so what we have are the students' notes. This has caused some criticism by linguists, at least one of them declaring the *Course* to be written by the Pseudo-Saussure.

Though not concerned with literary texts or with theory, the *Course* has been enormously influential and stands as one of the most important documents for the recent period in which speculation about language has been very important for criticism and theory. Saussure's treatment of the linguistic sign as composed of "signifier" and "signified" and his characterization of language as a system of differences (each word being identified by its difference from the other words in the system) flow through the work of structural and poststructural theorists. His emphasis on the arbitrary nature of the sign, though the idea is as old as Plato's *Cratylus* (above, page 41), is also important, for he develops it systematically beyond his predecessors' thoughts, including a future science, "semiology," not to be confused with "semiotics" proposed by C.S. Peirce (above, page 652).

Saussure's structuralism is the result of his effort to make a science of linguistics. Just as no science wants actual objects in or animals walking through its system, so did Saussure want no objects in his. As a result, the objects that the words are said to denote are (with some inconsistency criticized by others) banished, and the linguistic sign is "diacritical," a combination of signifier and signified. The latter is the concept, the former the so-called sound-image. The relation of sign to object (its denotation or reference) is "arbitrary"; so is the relation of signifier to signified. With the object banished, language can be considered a system with its own internally generated set of rules.

Saussure also drew a distinction between diachronic (historical) and synchronic (structural) linguistics; opting for the latter, he reduced the role of the traditional notions of influence and change in linguistic study. In a Saussurean structure, each word is a unit regarded entirely in terms of its difference from other words in the system. Thus there is a sense in which what we might call the spaces between words take precedence over the words as such. The system can be regarded as one composed of negative relations rather than positive substances.

Of particular interest to literary critics is also Saussure's distinction between *langue* and *parole*. *Langue* is the system of a language as a whole; *parole* is a particular usage within it. In structuralist literary criticism, a literary text is, by analogy, a *parole*.

The *Course*'s influence has been extended into anthropology (principally by Claude Lévi-Strauss [below, page 1119]) and into philosophy by Jacques Derrida (below, page 1203), who puts it, however, under critical scrutiny, particularly with respect to Saussure's emphasis on speech rather than writing. Also, in deconstruction Saussure's closed system is seen as actually infinitely open, since there is nothing to call a halt to a chain of differential relations. Thus analysis of Saussure's system has been one of the forces leading to poststructuralism.

Saussure published little in his lifetime, mainly essays on fairly specialized linguistic subjects. The *Course in General Linguistics* (1913) appeared in English translation in 1959. Saussure's writings in French are found in *Recueil de publications scientifique de F. de Saussure* (1922). Jean Starobinski has presented Saussure's strange *Anagrammes* in *Les Mots sous les mots* (1971), translated as *Words upon Words* (1979). See Rulon S. Wells, "De Saussure's System of Linguistics," *Word* 3 (1947); the introduction by Manuel Mourette-Lema to *A Geneva Reader in Linguistics,* R. Goedel, ed. (1969); Jonathan Culler, *Ferdinand de Saussure* (1976); Roy Harris, *Reading Saussure* (1986) and his *Language, Saussure, and Wittgenstein* (1988); Robert M. Strozier, *Saussure, Derrida, and the Metaphysics of Subjectivity* (1988); Francoise Gadet, *Saussure and Contemporary Culture* (tr. 1989); David Holdcroft, *Saussure: Signs, System, and Arbitrariness* (1991).

Course in General Linguistics

Part One

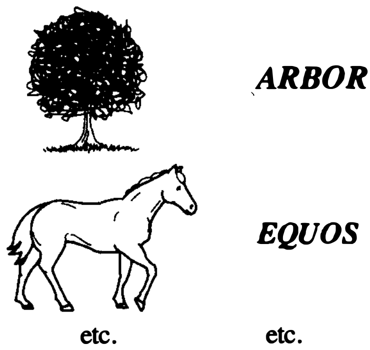
General Principles

Chapter I

Nature of the Linguistic Sign

1. *Sign, Signified, Signifier*

Some people regard language, when reduced to its elements, as a naming-process only—a list of words, each corresponding to the thing that it names. For example:



This conception is open to criticism at several points. It assumes that ready-made ideas exist before words; it does not tell us whether a name is vocal or psychological in nature (*arbor,* for instance, can be considered from either viewpoint); finally, it lets us assume that the linking of a name and a thing is a very simple operation—an assumption that is anything but true. But this rather naive approach can bring us near the truth by showing us that the linguistic unit is a double entity, one formed by the associating of two terms.

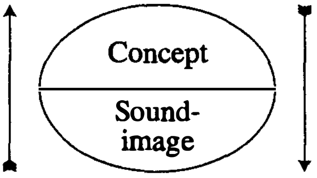
We have seen in considering the speaking-circuit that both terms involved in the linguistic sign are psychological and are united in the brain by an associative bond. This point must be emphasized.

The linguistic sign unites, not a thing and a name, but a concept and a sound-image. The latter is not the material sound, a purely physical thing, but the psychological imprint of the sound, the impression that it makes on our senses. The sound-image is sensory, and if I happen to call it "material," it is only in that sense, and by way of opposing it to the other term of the association, the concept, which is generally more abstract.

The psychological character of our sound-images becomes apparent when we observe our own speech. Without moving our lips or tongue, we can talk to ourselves or recite mentally a selection of verse. Because we regard the words of our language as sound-images, we must avoid speaking of the "phonemes" that make up the words. This term, which suggests vocal activity, is applicable to the spoken word only, to the realization of the inner image in discourse. We can avoid that misunderstanding by speaking of the *sounds* and *syllables* of a word provided we remember that the names refer to the sound-image.

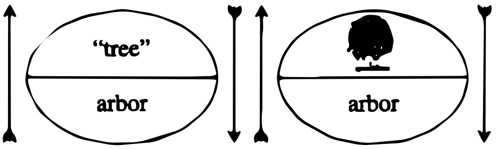
Course de linguistque gènerale was published in France in 1913. The selection here is from *Course in General Linguistics* translated by Wade Baskins (New York: The Philosophical Library, 1959).

The linguistic sign is then a two-sided psychological entity that can be represented by the drawing:



The two elements are intimately united, and each recalls the other. Whether we try to find the meaning of the Latin word *arbor* or the word that Latin uses to designate the concept "tree," it is clear that only the associations sanctioned by that language appear to us to conform to reality, and we disregard whatever others might be imagined.

Our definition of the linguistic sign poses an important question of terminology. I call the combination of a concept and a sound-image a *sign,* but in current usage the term generally designates only a sound-image, a word, for example (*arbor,* etc.). One tends to forget that *arbor* is called a sign only because it carries the concept "tree," with the result that the idea of the sensory part implies the idea of the whole.



Ambiguity would disappear if the three notions involved here were designated by three names, each suggesting and opposing the others. I propose to retain the word *sign* [*signe*] to designate the whole and to replace *concept* and *sound-image* respectively by *signified* [*signifié*] and *signifier* [*signifiant*]; the last two terms have the advantage of indicating the opposition that separates them from each other and from the whole of which they are parts. As regards *sign,* if I am satisfied with it, this is simply because I do not know of any word to replace it, the ordinary language suggesting no other.

The linguistic sign, as defined, has two primordial characteristics. In enunciating them I am also positing the basic principles of any study of this type.

2. *Principle I: The Arbitrary Nature of the Sign*

The bond between the signifier and the signified is arbitrary. Since I mean by sign the whole that results from the associating of the signifier with the signified, I can simply say: *the linguistic sign is arbitrary.*

The idea of "sister" is not linked by any inner relationship to the succession of sounds *s-ö-r* which serves as its signifier in French; that it could be represented equally by just any other sequence is proved by differences among languages and by the very existence of different languages: the signified "ox" has as its signifier *b-ö-f* on one side of the border and *o-k-s (Ochs)* on the other.

No one disputes the principle of the arbitrary nature of the sign, but it is often easier to discover a truth than to assign to it its proper place. Principle I dominates all the linguistics of language; its consequences are numberless. It is true that not all of them are equally obvious at first glance; only after many detours does one discover them, and with them the primordial importance of the principle.

One remark in passing: when semiology becomes organized as a science, the question will arise whether or not it properly includes modes of expression based on completely natural signs, such as pantomime. Supposing that the new science welcomes them, its main concern will still be the whole group of systems grounded on the arbitrariness of the sign. In fact, every means of expression used in society is based, in principle, on collective behavior or—what amounts to the same thing—on convention. Polite formulas, for instance, though often imbued with a certain natural expressiveness (as in the case of a Chinese who greets his emperor by bowing down to the ground nine times), are nonetheless fixed by rule; it is this rule and not the intrinsic value of the gestures that obliges one to use them. Signs that are wholly arbitrary realize better than the others the ideal of the semiological process; that is why language, the most complex and universal of all systems of expression, is also the most characteristic; in this sense linguistics can become the master-pattern for all branches of semiology although language is only one particular semiological system.

The word *symbol* has been used to designate the linguistic sign, or more specifically, what is here called the signifier. Principle I in particular weighs against the use of this term. One characteristic of the symbol is that it is never wholly arbitrary; it is not empty, for there is the rudiment of a natural bond between the signifier and the signified. The symbol of justice, a pair of scales, could not be replaced by just any other symbol, such as a chariot.

The word *arbitrary* also calls for comment. The term should not imply that the choice of the signifier is left entirely to the speaker (we shall see below that the individual does not have the power to change a sign in any way once it has become established in the linguistic community); I mean that it is unmotivated, i.e. arbitrary in that it actually has no natural connection with the signified.

In concluding let us consider two objections that might be raised to the establishment of Principle I:

1) *Onomatopoeia* might be used to prove that the choice of the signifier is not always arbitrary. But onomatopoeic formations are never organic elements of a linguistic system. Besides, their number is much smaller than is generally supposed. Words like French *fouet* 'whip' or *glas* 'knell' may strike certain ears with suggestive sonority, but to see that they have not always had this property we need only examine their Latin forms (*fouet* is derived from *fāgus* 'beech-tree,' *glas* from *classicum* 'sound of a trumpet'). The quality of their present sounds, or rather the quality that is attributed to them, is a fortuitous result of phonetic evolution.

As for authentic onomatopoeic words (e.g. *glug-glug, tick-tock*, etc.), not only are they limited in number, but also they are chosen somewhat arbitrarily, for they are only approximate and more or less conventional imitations of certain sounds (cf. English *bow-bow* and French *ouaoua*). In addition, once these words have been introduced into the language, they are to a certain extent subjected to the same evolution—phonetic, morphological, etc.—that other words undergo (cf. *pigeon*, ultimately from Vulgar Latin *pīpiō*, derived in turn from an onomatopoeic formation): obvious proof that they lose something of their original character in order to assume that of the linguistic sign in general, which is unmotivated.

2) *Interjections*, closely related to onomatopoeia, can be attacked on the same grounds and come no closer to refuting our thesis. One is tempted to see in them spontaneous expressions of reality dictated, so to speak, by natural forces. But for most interjections we can show that there is no fixed bond between their signified and their signifier. We need only compare two languages on this point to see how much such expressions differ from one language to the next (e.g. the English equivalent of French *aïe!* is *ouch!*). We know, moreover, that many interjections were once words with specific meanings (cf. French *diable!* 'darn!' *mordieu!* 'golly!' from *mort Dieu* 'God's death.' etc.).

Onomatopoeic formations and interjections are of secondary importance, and their symbolic origin is in part open to dispute.

3. *Principle II: The Linear Nature of the Signifier*

The signifier, being auditory, is unfolded solely in time from which it gets the following characteristics; (a) it represents a span, and (b) the span is measurable in a single dimension; it is a line.

While Principle II is obvious, apparently linguists have always neglected to state it, doubtless because they found it too simple; nevertheless, it is fundamental, and its consequences are incalculable. Its importance equals that of Principle I: the whole mechanism of language depends upon it. In contrast to visual signifiers (nautical signals, etc.) which can offer simultaneous groupings in several dimensions, auditory signifiers have at their command only the dimension of time. Their elements are presented in succession; they form a chain. This feature becomes readily apparent when they are represented in writing and the spatial line of graphic marks is substituted for succession in time.

Sometimes the linear nature of the signifier is not obvious. When I accent a syllable, for instance, it seems that I am concentrating more than one significant element on the same point. But this is an illusion; the syllable and its accent constitute only one phonational act. There is no duality within the act but only different oppositions to what precedes and what follows.

Chapter IV

Linguistic Value

1. *Language as Organized Thought Coupled with Sound*

To prove that language is only a system of pure values, it is enough to consider the two elements involved in its functioning: ideas and sounds.

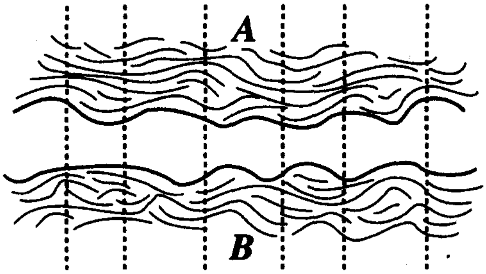
Psychologically our thought—apart from its expression in words—is only a shapeless and indistinct mass. Philosophers and linguists have always agreed in recognizing that without the help of signs we would be unable to make a clear-cut, consistent distinction between two ideas. Without language, thought is a vague, uncharted nebula.[1] There are no pre-existing ideas, and nothing is distinct before the appearance of language.

Against the floating realm of thought, would sounds by themselves yield predelimited entities? No more so than ideas. Phonic substance is neither more fixed nor more rigid than thought; it is not a mold into which thought must of necessity fit but a plastic substance divided in turn into distinct parts to furnish the signifiers needed by thought. The linguistic fact can therefore be pictured in its totality—i.e.

---

[1] The question of what comes first, thought or expression, has its own history and can be traced, for example, from Locke (above, page 281), through Benedetto Croce's *Aesthetic* (1900), to Cassirer's *Philosophy of Symbolic Forms* and his *An Essay on Man* (below, page 1018). But see also Peirce (above, page 652).

language—as a series of contiguous subdivisions marked off on both the indefinite plane of jumbled ideas *(A)* and the equally vague plane of sounds *(B)*. The following diagram gives a rough idea of it:



The characteristic role of language with respect to thought is not to create a material phonic means for expressing ideas but to serve as a link between thought and sound, under conditions that of necessity bring about the reciprocal delimitations of units. Thought, chaotic by nature, has to become ordered in the process of its decomposition. Neither are thoughts given material form nor are sounds transformed into mental entities; the somewhat mysterious fact is rather that "thought-sound" implies division, and that language works out its units while taking shape between two shapeless masses. Visualize the air in contact with a sheet of water; if the atmospheric pressure changes, the surface of the water will be broken up into a series of divisions, waves; the waves resemble the union or coupling of thought with phonic substance.

Language might be called the domain of articulations, using the word as it was defined earlier. Each linguistic term is a member, an *articulus* in which an idea is fixed in a sound and a sound becomes the sign of an idea.

Language can also be compared with a sheet of paper: thought is the front and the sound the back; one cannot cut the front without cutting the back at the same time; likewise in language, one can neither divide sound from thought nor thought from sound; the division could be accomplished only abstractedly, and the result would be either pure psychology or pure phonology.

Linguistics then works in the borderland where the elements of sound and thought combine; *their combination produces a form, not a substance.*

These views give a better understanding of what was said before about the arbitrariness of signs. Not only are the two domains that are linked by the linguistic fact shapeless and confused, but the choice of a given slice of sound to name a given idea is completely arbitrary. If this were not true, the notion of value would be compromised, for it would include an externally imposed element. But actually values remain entirely relative, and that is why the bond between the sound and the idea is radically arbitrary.

The arbitrary nature of the sign explains in turn why the social fact alone can create a linguistic system. The community is necessary if values that owe their existence solely to usage and general acceptance are to be set up; by himself the individual is incapable of fixing a single value.

In addition, the idea of value, as defined, shows that to consider a term as simply the union of a certain sound with a certain concept is grossly misleading. To define it in this way would isolate the term from its system; it would mean assuming that one can start from the terms and construct the system by adding them together when, on the contrary, it is from the interdependent whole that one must start and through analysis obtain its elements.

To develop this thesis, we shall study value successively from the viewpoint of the signified or concept (Section 2), the signifier (Section 3), and the complete sign (Section 4).

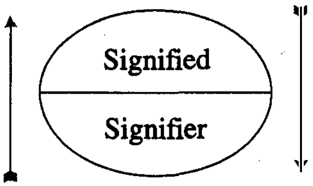
Being unable to seize the concrete entities or units of language directly, we shall work with words. While the word does not conform exactly to the definition of the linguistic unit, it at least bears a rough resemblance to the unit and has the advantage of being concrete; consequently, we shall use words as specimens equivalent to real terms in a synchronic system, and the principles that we evolve with respect to words will be valid for entities in general.

2. *Linguistic Value from a Conceptual Viewpoint*

When we speak of the value of a word, we generally think first of its property of standing for an idea, and this is in fact one side of linguistic value. But if this is true, how does *value* differ from *signification?* Might the two words be synonyms? I think not, although it is easy to confuse them, since the confusion results not so much from their similarity as from the subtlety of the distinction that they mark.

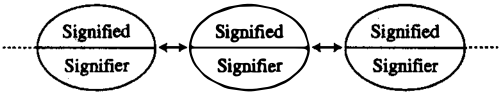
From a conceptual viewpoint, value is doubtless one element in signification, and it is difficult to see how signification can be dependent upon value and still be distinct from it. But we must clear up the issue or risk reducing language to a simple naming-process.

Let us first take signification as it is generally understood and as it was pictured previously. As the arrows in the drawing show, it is only the counterpart of the sound-image. Everything that occurs concerns only the sound-image and the concept when we look upon the word as independent and self-contained.



But here is the paradox: on the one hand the concept seems to be the counterpart of the sound-image, and on the other hand the sign itself is in turn the counterpart of the other signs of language.

Language is a system of interdependent terms in which the value of each term results solely from the simultaneous presence of the others, as in the diagram:



How, then, can value be confused with signification, i.e. the counterpart of the sound-image? It seems impossible to liken the relations represented here by horizontal arrows to those represented above by vertical arrows. Putting it another way—and again taking up the example of the sheet of paper that is cut in two—it is clear that the observable relation between the different pieces A, B, C, D, etc. is distinct from the relation between the front and back of the same piece as in A/A′, B/B′, etc.

To resolve the issue, let us observe from the outset that even outside language all values are apparently governed by the same paradoxical principle. They are always composed:

(1) of a *dissimilar* thing that can be *exchanged* for the thing of which the value is to be determined; and

(2) of *similar* things that can be *compared* with the thing of which the value is to be determined.

Both factors are necessary for the existence of a value. To determine what a five-franc piece is worth one must therefore know: (1) that it can be exchanged for a fixed quantity of a different thing, e.g. bread; and (2) that it can be compared with a similar value of the same system, e.g. a one-franc piece, or with coins of another system (a dollar, etc.). In the same way a word can be exchanged for something dissimilar, an idea; besides, it can be compared with something of the same nature, another word. Its value is therefore not fixed so long as one simply states that it can be "exchanged" for a given concept, i.e. that it has this or that signification: one must also compare it with similar values, with other words that stand in opposition to it. Its content is really fixed only by the concurrence of everything that exists outside it. Being part of a system, it is endowed not only with a signification but also and especially with a value, and this is something quite different.

A few examples will show clearly that this is true. Modern French *mouton* can have the same signification as English *sheep* but not the same value, and this for several reasons, particularly because in speaking of a piece of meat ready to be served on the table. English uses *mutton* and not *sheep*. The difference in value between *sheep* and *mouton* is due to the fact that *sheep* has beside it a second term while the French word does not.

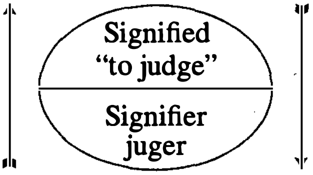
Within the same language, all words used to express related ideas limit each other reciprocally; synonyms like French *redouter* 'dread,' *craindre* 'fear,' and *avoir peur* 'be afraid' have value only through their opposition: if *redouter* did not exist, all its content would go to its competitors. Conversely, some words are enriched through contact with others: e.g. the new element introduced in *décrépit* (un vieillard *décrépit*) results from the coexistence of *décrépi* (un mur *décrépi*). The value of just any term is accordingly determined by its environment; it is impossible to fix even the value of the word signifying "sun" without first considering its surroundings: in some languages it is not possible to say "sit in the *sun*."

Everything said about words applies to any term of language, e.g. to grammatical entities. The value of a French plural does not coincide with that of a Sanskrit plural even though their signification is usually identical; Sanskrit has three numbers instead of two (*my eyes, my ears, my arms, my legs,* etc. are dual); it would be wrong to attribute the same value to the plural in Sanskrit and in French; its value clearly depends on what is outside and around it.

If words stood for pre-existing concepts, they would all have exact equivalents in meaning from one language to the next; but this is not true. French uses *louer (une maison)* 'let (a house)' indifferently to mean both "pay for" and "receive payment for," whereas German uses two words, *mieten* and *vermieten;* there is obviously no exact correspondence of values. The German verbs *schätzen* and *urteilen* share a number of significations, but that correspondence does not hold at several points.

Inflection offers some particularly striking examples. Distinctions of time, which are so familiar to us, are unknown in certain languages. Hebrew does not recognize even the fundamental distinctions between the past, present, and future. Proto-Germanic has no special form for the future; to say that the future is expressed by the present is wrong, for the value of the present is not the same in Germanic as in languages that have a future along with the present. The Slavic languages regularly single out two aspects of the verb: the perfective represents action as a point, complete in its totality; the imperfective represents it as taking place, and on the line of time. The categories are difficult for a Frenchman to understand, for they are unknown in French; if they were predetermined, this would not be true. Instead of pre-existing ideas then, we find in all the foregoing examples *values* emanating from the system. When they are said to correspond to concepts, it is understood that the concepts are purely differential and defined not by their positive content but negatively by their relations with the other terms of the system. Their most precise characteristic is in being what the others are not.

Now the real interpretation of the diagram of the signal becomes apparent. Thus



means that in French the concept "to judge" is linked to the sound-image *juger:* in short, it symbolizes signification. But it is quite clear that initially the concept is nothing, that is only a value determined by its relations with other similar values, and that without them the signification would not exist. If I state simply that a word signifies something when I have in mind the associating of a sound-image with a concept, I am making a statement that may suggest what actually happens, but by no means am I expressing the linguistic fact in its essence and fullness.

3. *Linguistic Value from a Material Viewpoint*

The conceptual side of value is made up solely of relations and differences with respect to the other terms of language, and the same can be said of its material side. The important thing in the word is not the sound alone but the phonic differences that make it possible to distinguish this word from all others, for differences carry signification.

This may seem surprising, but how indeed could the reverse be possible? Since one vocal image is no better suited than the next for what it is commissioned to express, it is evident, even a *priori,* that a segment of language can never in the final analysis be based on anything except its noncoincidence with the rest. *Arbitrary* and *differential* are two correlative qualities.

The alteration of linguistic signs clearly illustrates this. It is precisely because the terms *a* and *b* as such are radically incapable of reaching the level of consciousness—one is always conscious of only the *a/b* difference—that each term is free to change according to laws that are unrelated to its signifying function. No positive sign characterizes the genitive plural in Czech *žen;* still the two forms *žena: žen* function as well as the earlier forms *žena: ženb; žen* has value only because it is different.

Here is another example that shows even more clearly the systematic role of phonic differences: in Greek, *éphēn* is an imperfect and *éstēn* an aorist although both words are formed in the same way; the first belongs to the system of the present indicative of *phēmī* 'I say,' whereas there is no present **stēmi;* now it is precisely the relation *phēmī: éphēn* that corresponds to the relation between the present and the imperfect (cf. *déiknūmi: edéiknūn,* etc.). Signs function, then, not through their intrinsic value but through their relative position.

In addition, it is impossible for sound alone, a material element, to belong to language. It is only a secondary thing, substance to be put to use. All our conventional values have the characteristic of not being confused with the tangible element which supports them. For instance, it is not the metal in a piece of money that fixes its value. A coin nominally worth five francs may contain less than half its worth of silver. Its value will vary according to the amount stamped upon it and according to its use inside or outside a political boundary. This is even more true of the linguistic signifier, which is not phonic but incorporeal—constituted not by its material substance but by the differences that separate its sound-image from all others.

The foregoing principle is so basic that it applies to all the material elements of language, including phonemes. Every language forms its words on the basis of a system of sonorous elements, each element being a clearly delimited unit and one of a fixed number of units. Phonemes are characterized not, as one might think, by their own positive quality but simply by the fact that they are distinct. Phonemes are above all else opposing, relative, and negative entities.

Proof of this is the latitude that speakers have between points of convergence in the pronunciation of distinct sounds. In French, for instance, general use of a dorsal *r* does not prevent many speakers from using a tongue-tip trill; language is not in the least disturbed by it; language requires only that the sound be different and not, as one might imagine, that it have an invariable quality. I can even pronounce the French *r* like German *ch* in *Bach, doch,* etc., but in German I could not use *r* instead of *ch,* for German gives recognition to both elements and must keep them apart. Similarly, in Russian there is no latitude for *t* in the direction of *t'* (palatalized *t*), for the result would be the confusing of two sounds differentiated by the language (cf. *gov-*

orit' 'speak' and *goverit* 'he speaks'), but more freedom may be taken with respect to *th* (aspirated *t*) since this sound does not figure in the Russian system of phonemes.

Since an identical state of affairs is observable in writing, another system of signs, we shall use writing to draw some comparisons that will clarify the whole issue. In fact:

1) The signs used in writing are arbitrary; there is no connection, for example, between the letter *t* and the sound that it designates.

2) The value of letters is purely negative and differential. The same person can write *t*, for instance, in different ways: The only requirement is that the sign for *t* not be confused in his script with the signs used for *l, d,* etc.

3) Values in writing function only through reciprocal opposition within a fixed system that consists of a set number of letters. This third characteristic, though not identical to the second, is closely related to it, for both depend on the first. Since the graphic sign is arbitrary, its form matters little or rather matters only within the limitations imposed by the system.

4) The means by which the sign is produced is completely unimportant, for it does not affect the system (this also follows from characteristic 1). Whether I make the letters in white or black, raised or engraved, with pen or chisel—all this is of no importance with respect to their signification.

4. *The Sign Considered in Its Totality*

Everything that has been said up to this point boils down to this: in language there are only differences. Even more important: a difference generally implies positive terms between which the difference is set up; but in language there are only differences *without positive terms.* Whether we take the signified or the signifier, language has neither ideas nor sounds that existed before the linguistic system, but only conceptual and phonic differences that have issued from the system. The idea or phonic substance that a sign contains is of less importance than the other signs that surround it. Proof of this is that the value of a term may be modified without either its meaning or its sound being affected, solely because a neighboring term has been modified.

But the statement that everything in language is negative is true only if the signified and the signifier are considered separately; when we consider the sign in its totality, we have something that is positive in its own class. A linguistic system is a series of differences of sound combined with a series of differences of ideas; but the pairing of a certain number of acoustical signs with as many cuts made from the mass of thought engenders a system of values; and this system serves as the effective link between the phonic and psychological elements within each sign. Although both the signified and the signifier are purely differential and negative when considered separately, their combination is a positive fact; it is even the sole type of facts that language has, for maintaining the parallelism between the two classes of differences is the distinctive function of the linguistic institution.

Certain diachronic facts are typical in this respect. Take the countless instances where alteration of the signifier occasions a conceptual change and where it is obvious that the sum of the ideas distinguished corresponds in principle to the sum of the distinctive signs. When two words are confused through phonetic alteration (e.g. French *décrépit* from *dēcrepitus* and *décrépi* from *crispus*), the ideas that they express will also tend to become confused if only they have something in common. Or a word may have different forms (cf. *chaise* 'chair' and *chaire* 'desk'). Any nascent difference will tend invariably to become significant but without always succeeding or being successful on the first trial. Conversely, any conceptual difference perceived by the mind seeks to find expression through a distinct signifier, and two ideas that are no longer distinct in the mind tend to merge into the same signifier.

When we compare signs—positive terms—with each other, we can no longer speak of difference; the expression would not be fitting, for it applies only to the comparing of two sound-images, e.g. *father* and *mother,* or two ideas, e.g. the idea "father" and the idea "mother"; two signs, each having a signified and signifier, are not different but only distinct. Between them there is only *opposition.* The entire mechanism of language, with which we shall be concerned later, is based on oppositions of this kind and of the phonic and conceptual differences that they imply.

What is true of value is true also of the unit. A unit is a segment of the spoken chain that corresponds to a certain concept; both are by nature purely differential.

Applied to units, the principle of differentiation can be stated in this way: *the characteristics of the unit blend with the unit itself.* In language, as in any semiological system, whatever distinguishes one sign from the others constitutes it. Difference makes character just as it makes value and the unit.

Another rather paradoxical consequence of the same principle is this: in the last analysis what is commonly referred to as a "grammatical fact" fits the definition of the unit, for it always expresses an opposition of terms; it differs only in that the opposition is particularly significant (e.g. the formation of German plurals of the type *Nacht: Nächte*). Each term present in the grammatical fact (the singular without umlaut or final *e* in opposition to the plural with umlaut and -*e*) consists of the interplay of a number of oppositions within the system. When isolated, neither *Nacht* nor *Nächte* is anything: thus everything is opposition. Putting it another way, the *Nacht: Nächte* relation can be expressed by an algebraic formula *a/b* in which *a* and *b* are not simple terms but result from a set of relations. Language, in a manner of speaking, is a type of algebra consisting solely of complex terms. Some of its oppositions are more significant than others; but units and grammatical facts are only different names for designating diverse aspects of the same general fact: the functioning of linguistic oppositions. This statement is so true that we might very well approach the problem of units by starting from grammatical facts. Taking an opposition like *Nacht: Nächte,* we might ask what are the units involved in it. Are they only the two words, the whole series of similar words, *a* and *ä,* or all singulars and plurals, etc.?

Units and grammatical facts would not be confused if linguistic signs were made up of something besides differences. But language being what it is, we shall find nothing simple in it regardless of our approach; everywhere and always there is the same complex equilibrium of terms that mutually condition each other. Putting it another way, *language is a form and not a substance.* This truth could not be overstressed, for all the mistakes in our terminology, all our incorrect ways of naming things that pertain to language, stem from the involuntary supposition that the linguistic phenomenon must have substance.

Chapter V

Syntagmatic and Associative Relations

1. *Definitions*

In a language-state everything is based on relations. How do they function?

Relations and differences between linguistic terms fall into two distinct groups, each of which generates a certain class of values. The opposition between the two classes gives a better understanding of the nature of each class. They correspond to two forms of our mental activity, both indispensable to the life of language.

In discourse, on the one hand, words acquire relations based on the linear nature of language because they are chained together. This rules out the possibility of pronouncing two elements simultaneously. The elements are arranged in sequence on the chain of speaking. Combinations supported by linearity are *syntagms.* The syntagm is always composed of two or more consecutive units (e.g. French *relire* 're-read,' *contre tous* 'against everyone,' *la vie humaine* 'human life.' *Dieu est bon* 'God is good,' *s'il fait beau temps, nous sortirons* 'if the weather is nice, we'll go out,' etc.). In the syntagm a term acquires its value only because it stands in opposition to everything that precedes or follows it, or to both.

Outside discourse, on the other hand, words acquire relations of a different kind. Those that have something in common are associated in the memory, resulting in groups marked by diverse relations. For instance, the French word *enseignement* 'teaching' will unconsciously call to mind a host of other words (*enseigner* 'teach,' *renseigner* 'acquaint,' etc.; or *armement* 'armament,' *changement* 'amendment,' etc.; or *éducation* 'education,' *apprentissage* 'apprenticeship,' etc.). All those words are related in some way.

We see that the co-ordinations formed outside discourse differ strikingly from those formed inside discourse. Those formed outside discourse are not supported by linearity. Their seat is in the brain; they are a part of the inner storehouse that makes up the language of each speaker. They are *associative relations.*

The syntagmatic relation is *in praesentia.* It is based on two or more terms that occur in an effective series. Against this, the associative relation unites terms *in absentia* in a potential mnemonic series.

From the associative and syntagmatic viewpoint a linguistic unit is like a fixed part of a building, e.g. a column. On the one hand, the column has a certain relation to the architrave that it supports; the arrangement of the two units in space suggests the syntagmatic relation. On the other hand, if the column is Doric, it suggests a mental comparison of this style with others (Ionic, Corinthian, etc.) although none of these elements is present in space: the relation is associative.

Each of the two classes of co-ordination calls for some specific remarks.

2. *Syntagmatic Relations*

The examples have already indicated that the notion of syntagm applies not only to words but to groups of words, to complex units of all lengths and types (compounds, derivatives, phrases, whole sentences).

It is not enough to consider the relation that ties together the different parts of syntagms (e.g. French *contre* 'against' and *tous* 'everyone' in *contre tous, contre* and *maître* 'master' in *contremaître* 'foreman'), one must also bear in mind the relation that links the whole to its parts (e.g. *contre tous* in opposition on the one hand to *contre* and on the other *tous,* or *contremaître* in opposition to *contre* and *maître*).

An objection might be raised at this point. The sentence is the ideal type of syntagm. But it belongs to speaking, not to language. Does it follow that the syntagm belongs to speaking? I do not think so. Speaking is characterized by freedom of combinations; one must therefore ask whether or not all syntagms are equally free.

It is obvious from the first that many expressions belong to language. These are the pat phrases in which any change is prohibited by usage, even if we can single out their meaningful elements (cf. *à quoi bon?* 'what's the use?' *allons donc!* 'nonsense!'). The same is true, though to a lesser degree, of expressions like *prendre la mouche* 'take offense easily,' *forcer la main à quelqu'un* 'force someone's hand,' *rompre une lance* 'break a lance,' or even *avoir mal* (*à la tête,* etc.) 'have (a headache, etc.),' *à force de* (*soins,* etc.) 'by dint of (care, etc.),' *que vous en semble?* 'how do you feel about it?' *pas n'est besoin de . . .* 'there's no need for . . .' etc., which are characterized by peculiarities of signification or syntax. These idiomatic twists cannot be improvised; they are furnished by tradition. There are also words which, while lending themselves perfectly to analysis, are characterized by some morphological anomaly that is kept solely by dint of usage (cf. *difficulté* 'difficulty' beside *facilité* 'facility,' etc., and *mourrai* '[I] shall die' beside *dormirai* '[I] shall sleep').

There are further proofs. To language rather than to speaking belong the syntagmatic types that are built upon regular forms. Indeed, since there is nothing abstract in language, the types exist only if language has registered a sufficient number of specimens. When a word like *indécorable* arises in speaking, its appearance supposes a fixed type, and this type is in turn possible only through remembrance of a sufficient number of similar words belonging to language (*impardonable* 'unpardonable,' *intolérable* 'intolerable,' *infatigable* 'indefatigable,' etc.). Exactly the same is true of sentences and groups of words built upon regular patterns. Combinations like *la terre tourne* 'the world turns,' *que vous dit-il?* 'what does he say to you?' etc. correspond to general types that are in turn supported in the language by concrete remembrances.

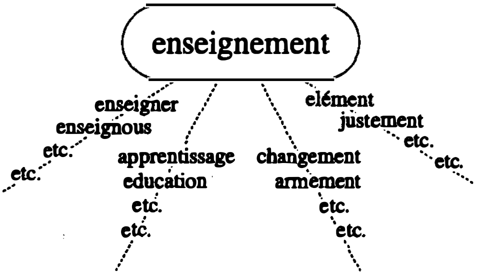
But we must realize that in the syntagm there is no clear-cut boundary between the language fact, which is a sign of collective usage, and the fact that belongs to speaking and depends on individual freedom. In a great number of instances it is hard to class a combination of units because both forces have combined in producing it, and they have combined in indeterminable proportions.

3. *Associative Relations*

Mental association creates other groups besides those based on the comparing of terms that have something in common; through its grasp of the nature of the relations that bind the terms together, the mind creates as many associative series as there are diverse relations. For instance, in *enseignement* 'teaching,' *enseigner* 'teach,' *enseignons* '(we) teach,' etc., one element, the radical, is common to every term; the same word may occur in a different series formed around another common element, the suffix (cf. *enseignement, armement, changement,* etc.); or the association may spring from the analogy of the concepts signified (*enseignement, instruction, apprentissage, éducation,* etc.); or again, simply from the similarity of the sound-images (e.g. *enseignement* and *justement* 'precisely'). Thus there is at times a double similarity of meaning and form, at times similarity only of form or of meaning. A word can always evoke everything that can be associated with it in one way or another.

Whereas a syntagm immediately suggests an order of succession and a fixed number of elements, terms in an associative family occur neither in fixed numbers nor in a definite order. If we associate *painful, delightful, frightful,* etc. we are unable to predict the number of words that the memory will suggest or the order in which they will appear. A particular word is like the center of a constellation; it is the point of convergence of an indefinite number of coordinated terms.

But of the two characteristics of the associative series—indeterminate order and indefinite number—only the first can always be verified; the second may fail to meet the test. This happens in the case of inflectional paradigms, which are typical of associative groupings. Latin *dominus, domini, dominō,* etc. is obviously an associative group formed around a common element, the noun theme *domin-*, but the series



is not indefinite as in the case of *enseignement, changement,* etc.; the number of cases is definite. Against this, the words have no fixed order of succession, and it is by a purely arbitrary act that the grammarian groups them in one way rather than in another; in the mind of speakers the nominative case is by no means the first one in the declension, and the order in which terms are called depends on circumstances.

Victor Shklovsky

1893–1984

A principal notion offered by the Russian Formalist movement early in the twentieth century was that of "defamiliarization." In Shklovsky's essay below the term plays the major role. Defamiliarization is described as a device to destroy habitual or "automatic" perception, as Boris Eichenbaum (below, page 867) later characterized it. Shklovsky presents the notion as part of an attack on the theories of Alexander Potebnya and of the Russian Symbolist movement in general. In place of emphasis on symbols and images as the fundamental defining elements of poetry—"thinking in images"—Shklovsky and the Formalists would study "phonetic and lexical structure" as well as the "characteristic distribution of words . . . the characteristic thought structures compounded from words." The shift led to the Structuralist movement and developments in linguistics associated with the Prague School. All of the structures that Shklovsky mentions create defamiliarization in poetry, the result of which is the experience of new satisfactions and perspectives. Poetry is described as "difficult, roughened, impeded language"; it is "attenuated, tortuous speech"; obviously it is "formed" speech. Even rhythm is seen according to this notion, and the result is a reversal of our usual assumptions about poetic technique.

Shklovsky was a founder of the OPOYAZ group in Russia, which flourished until it came under sharp and repressive attack by the Soviet state. Shklovsky was harshly criticized by Leon Trotsky in his *Literature and Revolution* (1924). The movement was subsequently defended by one of its founders Boris Eichenbaum in his essay "The Theory of the 'Formal Method'" (below, page 868), where Shklovsky's essay is discussed. Shklovsky himself retreated from theorizing in print under Communist rule and engaged in other literary and cinematic activities; finally, he was reconciled with the government.

Shklovsky's writings were collected and published in a single edition in Moscow in 1973–1974 by Khudozh' Lit'ra. His book on Trotsky was translated into English in 1978. See Victor Erlich, *Russian Formalism: History-Doctrine* (rev. ed. 1964); Mikhail M. Bakhtin [P. N. Medvedev], *The Formal Method in Literary Scholarship* (tr. 1978). See also bibliographical material in the selection from Eichenbaum (below, page 867). The Formalist movement is put in the context of Russian literary criticism by R. H. Stacy, *Russian Literary Criticism: A Short History* (1974).

Art as Technique

"Art is thinking in images." This maxim, which even high school students parrot, is nevertheless the starting point for the erudite philologist who is beginning to put together some kind of systematic literary theory. The idea, originated in part by Potebnya, has spread. "Without imagery there is no art, and in particular no poetry," Potebnya writes.[1] And elsewhere, "Poetry, as well as prose, is first and foremost a special way of thinking and knowing."[2]

Poetry is a special way of thinking; it is, precisely, a way of thinking in images, a way which permits what is generally called "economy of mental effort," a way which makes for "a sensation of the relative ease of the process." Aesthetic feeling is the reaction to this economy. This is how the academician Ovsyaniko-Kulikovsky,[3] who undoubtedly read the works of Potebnya attentively, almost certainly understood and faithfully summarized the ideas of his teacher. Potebnya and his numerous disciples consider poetry a special kind of thinking—thinking by means of images; they feel that the purpose of imagery is to help channel various objects and activities into groups and to clarify the unknown by means of the known. Or, as Potebnya wrote:

> The relationship of the image to what is being clarified is that: (a) the image is the fixed predicate of that which undergoes change—the unchanging means of attracting what is perceived as changeable. . . . (b) the image is far clearer and simpler than what it clarifies.[4]

In other words:

> Since the purpose of imagery is to remind us, by approximation, of those meanings for which the image stands, and since, apart from this, imagery is unnecessary for thought, we must be more familiar with the image than with what it clarifies.[5]

It would be instructive to try to apply this principle to Tyutchev's comparison of summer lightning to deaf and dumb demons or to Gogol's comparison of the sky to the garment of God.[6]

"Without imagery there is no art"—"Art is thinking in images." These maxims have led to far-fetched interpretations of individual works of art. Attempts have been made to evaluate even music, architecture, and lyric poetry as imagistic thought. After a quarter of a century of such attempts Ovsyaniko-Kulikovsky finally had to assign lyric poetry, architecture, and music to a special category of imageless art and to define them as lyric arts appealing directly to the emotions. And thus he admitted an enormous area of art which is not a mode of thought. A part of this area, lyric poetry (narrowly considered), is quite like the visual arts; it is also verbal. But, much more important, visual art passes quite imperceptibly into nonvisual art; yet our perceptions of both are similar.

Nevertheless, the definition "Art is thinking in images," which means (I omit the usual middle terms of the argument) that art is the making of symbols, has survived the downfall of the theory which supported it. It survives chiefly in the wake of Symbolism, especially among the theorists of the Symbolist movement.

Many still believe, then, that thinking in images—thinking, in specific scenes of "roads and landscape" and "furrows and boundaries"[7]—is the chief characteristic of poetry. Consequently, they should have expected the history of "imagistic art," as they call it, to consist of a history of changes in imagery. But we find that images change little; from century to century, from nation to nation, from poet to poet, they flow on without changing. Images belong to no one: they are "the Lord's." The more you understand an age, the more convinced you become that the images a given poet used and which you thought his own were taken almost unchanged from another poet. The works of poets are classified or grouped according to the new techniques that poets discover and share, and according to their arrangement and development of the resources of language; poets are much more concerned with arranging images than with creating them. Images are given to poets; the ability to remember them is far more important than the ability to create them.

Shklovsky's *Art as Technique* first appeared in 1917. It is reprinted here from *Russian Formalist Criticism: Four Essays*, translated by Lee T. Lemon and Marion J. Reis (Lincoln: University of Nebraska Press, 1965).

[1] Alexander Potebnya (1835–1891), Russian philologist influenced by Wilhelm von Humboldt. [Shklovsky] Alexander Potebnya, *Iz zapisok po teorii slovesnosti* [*Notes on the Theory of Language*] (Kharkov, 1905), page 83.

[2] [Shklovsky] Ibid., page 97.

[3] [Lemon and Reis] Dimitry Ovsyaniko-Kulikovsky (1835–1920), a leading Russian scholar, was an early contributor to Marxist periodicals and a literary conservative, antagonistic towards the deliberately meaningless poems of the Futurists.

[4] [Shklovsky] Potebnya, *Iz zapisok po teorii slovesnosti*, page 314.

[5] [Shklovsky] Ibid., page 291.

[6] [Lemon and Reis] Fyodor Tyutchev (1803–1873), a poet, and Nicholas Gogol (1809–1852), master of prose fiction and satire, are mentioned here because their bold use of imagery cannot be accounted for by Potebnya's theory. Shklovsky is arguing that writers frequently gain their effects by comparing the commonplace to the exceptional rather than vice versa.

[7] [Lemon and Reis] This is an allusion to Vyacheslav Ivanov's *Borozdy i mezhi* [*Furrows and Boundaries*] (Moscow, 1916), a major statement of symbolist theory.

Imagistic thought does not, in any case, include all the aspects of art nor even all the aspects of verbal art. A change in imagery is not essential to the development of poetry. We know that frequently an expression is thought to be poetic, to be created for aesthetic pleasure, although actually it was created without such intent—e.g., Annensky's opinion that the Slavic languages are especially poetic and Andrey Bely's ecstasy over the technique of placing adjectives after nouns, a technique used by eighteenth-century Russian poets.[8] Bely joyfully accepts the technique as something artistic, or more exactly, as intended, if we consider intention as art. Actually, this reversal of the usual adjective-noun order is a peculiarity of the language (which had been influenced by Church Slavonic). Thus a work may be (1) intended as prosaic and accepted as poetic, or (2) intended as poetic and accepted as prosaic. This suggests that the artistry attributed to a given work results from the way we perceive it. By "works of art," in the narrow sense, we mean works created by special techniques designed to make the works as obviously artistic as possible.

Potebnya's conclusion, which can be formulated "poetry equals imagery," gave rise to the whole theory that "imagery equals symbolism," that the image may serve as the invariable predicate of various subjects. (This conclusion, because it expressed ideas similar to the theories of the Symbolists, intrigued some of their leading representatives—Andrey Bely, Merezhkovsky[9] and his "eternal companions" and, in fact, formed the basis of the theory of Symbolism.) The conclusion stems partly from the fact that Potebnya did not distinguish between the language of poetry and the language of prose. Consequently, he ignored the fact that there are two aspects of imagery: imagery as a practical means of thinking, as a means of placing objects within categories; and imagery as poetic, as a means of reinforcing an impression. I shall clarify with an example. I want to attract the attention of a young child who is eating bread and butter and getting the butter on her fingers. I call, "Hey, butterfingers!" This is a figure of speech, a clearly prosaic trope. Now a different example. The child is playing with my glasses and drops them. I call, "Hey butterfingers!"[10] This figure of speech is a poetic trope. (In the first example, "butterfingers" is metonymic; in the second, metaphoric—but this is not what I want to stress.)

Poetic imagery is a means of creating the strongest possible impression. As a method it is, depending upon its purpose, neither more nor less effective than other poetic techniques; it is neither more nor less effective than ordinary or negative parallelism, comparison, repetition, balanced structure, hyperbole, the commonly accepted rhetorical figures, and all those methods which emphasize the emotional effect of an expression (including words or even articulated sounds).[11] But poetic imagery only externally resembles either the stock imagery of fables and ballads or thinking in images—e.g., the example in Ovsyaniko-Kulikovsky's *Language and Art* in which a little girl calls a ball a little watermelon. Poetic imagery is but one of the devices of poetic language. Prose imagery is a means of abstraction: a little watermelon instead of a lampshade, or a little watermelon instead of a head, is only the abstraction of one of the object's characteristics, that of roundness. It is no different from saying that the head and the melon are both round. This is what is meant, but it has nothing to do with poetry.

The law of the economy of creative effort is also generally accepted. [Herbert] Spencer wrote:

> On seeking for some clue to the law underlying these current maxims, we may see shadowed forth in many of them, the importance of economizing the reader's or the hearer's attention. To so present ideas that they may be apprehended with the least possible mental effort, is the desideratum towards which most of the rules above quoted point. . . . Hence, carrying out the metaphor that language is the vehicle of thought, there seems reason to think that in all cases the friction and inertia of the vehicle deduct from its efficiency; and that in composition, the chief, if not the sole thing to be done, is to reduce this friction and inertia to the smallest possible amount.[12]

And R[ichard] Avenarius:

> If a soul possess inexhaustible strength, then, of

[9] Dmitri Sergeyevich Merezhkovsky (1865–1941).

[10] [Lemon and Reis] The Russian text involves a play on the word for "hat," colloquial for "clod," "duffer," etc.

[11] [Lemon and Reis] Shklovsky is here doing two things of major theoretical importance: (1) he argues that different techniques serve a single function and that (2) no single technique is all important. The second permits the formalists to be concerned with any and all literary devices; the first permits them to discuss the devices from a single consistent theoretical position.

[12] [Shklovsky] Herbert Spencer, *The Philosophy of Style* (Humboldt Library, vol. 34, New York, 1882), 2–3. [Lemon and Reis] Shklovsky's quoted reference, in Russian, preserves the idea of the original but shortens it.

> course, it would be indifferent to how much might be spent from this inexhaustible source; only the necessarily expended time would be important. But since its forces are limited, one is led to expect that the soul hastens to carry out the apperceptive process as expediently as possible—that is, with comparatively the least expenditure of energy, and, hence, with comparatively the best result.[13]

Petrazhitsky, with only one reference to the general law of mental effort, rejects [William] James's theory of the physical basis of emotion, a theory which contradicts his own.[14] Even Alexander Veselovsky acknowledged the principle of the economy of creative effort, a theory especially appealing in the study of rhythm, and agreed with Spencer: "A satisfactory style is precisely that style which delivers the greatest amount of thought in the fewest words."[15] And Andrey Bely, despite the fact that in his better pages he gave numerous examples of "roughened" rhythm and (particularly in the examples from Baratynsky) showed the difficulties inherent in poetic epithets, also thought it necessary to speak of the law of the economy of creative effort in his book[16]—a heroic effort to create a theory of art based on unverified facts from antiquated sources, on his vast knowledge of the techniques of poetic creativity, and on Krayevich's high school physics text.

These ideas about the economy of energy, as well as about the law and aim of creativity, are perhaps true in their application to "practical" language; they were, however, extended to poetic language. Hence they do not distinguish properly between the laws of practical language and the laws of poetic language. The fact that Japanese poetry has sounds not found in conversational Japanese was hardly the first factual indication of the differences between poetic and everyday language. Leo Jakubinsky has observed that the law of the dissimilation of liquid sounds does not apply to poetic language.[17] This suggested to him that poetic language tolerated the admission of hard-to-pronounce conglomerations of similar sounds. In his article, one of the first examples of scientific criticism, he indicates inductively, the contrast (I shall say more about this point later) between the laws of poetic language and the laws of practical language.[18]

We must, then, speak about the laws of expenditure and economy in poetic language not on the basis of an analogy with prose, but on the basis of the laws of poetic language.

If we start to examine the general laws of perception, we see that as perception becomes habitual, it becomes automatic. Thus, for example, all of our habits retreat into the area of the unconsciously automatic; if one remembers the sensations of holding a pen or of speaking in a foreign language for the first time and compares that with his feeling at performing the action for the ten thousandth time, he will agree with us. Such habituation explains the principles by which, in ordinary speech, we leave phrases unfinished and words half expressed. In this process, ideally realized in algebra, things are replaced by symbols. Complete words are not expressed in rapid speech; their initial sounds are barely perceived. Alexander Pogodin offers the example of a boy considering the sentence "The Swiss mountains are beautiful" in the form of a series of letters: *T, S, m, a, b.*[19]

This characteristic of thought not only suggests the method of algebra, but even prompts the choice of symbols (letters, especially initial letters). By this "algebraic" method of thought we apprehend objects only as shapes with imprecise extensions; we do not see them in their entirety but rather recognize them by their main characteristics. We see the object as though it were enveloped in a sack. We know what it is by its configuration, but we see only its silhouette. The object, perceived thus in the manner of prose perception, fades and does not leave even a first impression; ultimately even the essence of what it was is forgotten. Such perception explains why we fail to hear the prose word in its entirety (see Leo Jakubinsky's article[20]) and, hence, why (along with other slips of the tongue) we fail to pronounce it. The process of "algebrization," the over-automatization of an object, permits the greatest economy of perceptive effort. Either objects are assigned only one proper feature—a number, for example—or else they function as though by formula and do not even appear in cognition:

> I was cleaning a room and, meandering about, approached the divan and couldn't remember whether or not I had dusted it. Since these

[20] [Shklovsky] Jakubinsky, *Sborniki* I (1916).

> movements are habitual and unconscious, I could not remember and felt that it was impossible to remember—so that if I had dusted it and forgot—that is, had acted unconsciously, then it was the same as if I had not. If some conscious person had been watching, then the fact could be established. If, however, no one was looking, or looking on unconsciously, if the whole complex lives of many people go on unconsciously, then such lives are as if they had never been.[21]

And so life is reckoned as nothing. Habitualization devours works, clothes, furniture, one's wife, and the fear of war. "If the whole complex lives of many people go on unconsciously, then such lives are as if they had never been." And art exists that one may recover the sensation of life; it exists to make one feel things, to make the stone *stony*. The purpose of art is to impart the sensation of things as they are perceived and not as they are known. The technique of art is to make objects "unfamiliar," to make forms difficult, to increase the difficulty and length of perception because the process of perception is an aesthetic end in itself and must be prolonged. *Art is a way of experiencing the artfulness of an object; the object is not important.*

The range of poetic (artistic) work extends from the sensory to the cognitive, from poetry to prose, from the concrete to the abstract: from Cervantes's Don Quixote—scholastic and poor nobleman, half consciously bearing his humiliation in the court of the duke—to the broad but empty Don Quixote of Turgenev; from Charlemagne to the name "king" [in Russian "Charles" and "king" obviously derive from the same root, *korol*][22] The meaning of a work broadens to the extent that artfulness and artistry diminish; thus a fable symbolizes more than a poem, and a proverb more than a fable. Consequently, the least self-contradictory part of Potebnya's theory is his treatment of the fable, which, from his point of view, he investigated thoroughly. But since his theory did not provide for "expressive" works of art, he could not finish his book. As we know, *Notes on the Theory of Literature* was published in 1905, thirteen years after Potebnya's death. Potebnya himself completed only the section on the fable.[23]

After we see an object several times, we begin to recognize it. The object is in front of us and we know about it, but we do not see it[24]—hence we cannot say anything significant about it. Art removes objects from the automatism of perception in several ways. Here I want to illustrate a way used repeatedly by Leo Tolstoy,[25] that writer who, for Merezhkovsky at least, seems to present things as if he himself saw them, saw them in their entirety, and did not alter them.

Tolstoy makes the familiar seem strange by not naming the familiar object. He describes an object as if he were seeing it for the first time, an event as if it were happening for the first time. In describing something he avoids the accepted names of its parts and instead names corresponding parts of other objects. For example, in "Shame" Tolstoy "defamiliarizes" the idea of flogging in this way: "to strip people who have broken the law, to hurl them to the floor, and to rap on their bottoms with switches," and, after a few lines, "to lash about on the naked buttocks." Then he remarks:

> Just why precisely this stupid, savage means of causing pain and not any other—why not prick the shoulders or any part of the body with needles, squeeze the hands or the feet in a vise, or anything like that?

I apologize for this harsh example, but it is typical of Tolstoy's way of pricking the conscience. The familiar act of flogging is made unfamiliar both by the description and by the proposal to change its form without changing its nature. Tolstoy uses this technique of "defamiliarization" constantly. The narrator of "Kholstomer," for example, is a horse, and it is the horse's point of view (rather than a person's) that makes the content of the story seem unfamiliar. Here is how the horse regards the institution of private property:

> I understood well what they said about whipping and Christianity. But then I was absolutely in the dark. What's the meaning of "his own," "his colt"? From these phrases I saw that people thought there was some sort of connection between me and the stable. At the time I simply could not understand the connection. Only much later, when they separated me from the other horses, did I begin to understand. But even then I simply could not see what it meant when they called me "man's property." The words "my horse" referred to me, a living horse, and seemed as strange to me as the words "my land," "my air," "my water."

[25] Leo Tolstoy (above, page 757).

> But the words make a strong impression on me I thought about them constantly, and only after the most diverse experiences with people did I understand, finally, what they meant. They meant this: In life people are guided by words, not by deeds. It's not so much that they love the possibility of doing or not doing something as it is the possibility of speaking with words, agreed on among themselves, about various topics. Such are the words "my" and "mine," which they apply to different things, creatures, objects, and even to land, people, and horses. They agree that only one may say "mine" about this, that, or the other thing. And the one who says "mine" about the greatest number of things is, according to the game which they've agreed to among themselves, the one they consider the most happy. I don't know the point of all this, but it's true. For a long time I tried to explain it to myself in terms of some kind of real gain, but I had to reject that explanation because it was wrong. Many of those, for instance, who called me their own never rode on me—although others did. And so with those who fed me. Then again, the coachman, the veterinarians, and the outsiders in general treated me kindly, yet those who called me their own did not. In due time, having widened the scope of my observations, I satisfied myself that the notion "my," not only in relation to us horses, has no other basis than a narrow human instinct which is called a sense of or right to private property. A man says "this house is mine" and never lives in it; he only worries about its construction and upkeep. A merchant says "my shop," "my dry goods shop," for instance, and does not even wear clothes made from the better cloth he keeps in his own shop.
>
> There are people who call a tract of land their own, but they never set eyes on it and never take a stroll on it. There are people who call others their own, yet never see them. And the whole relationship between them is that the so-called "owners" treat the others unjustly.
>
> There are people who call women their own, or their "wives," but their women live with other men. And people strive not for the good in life, but for goods they can call their own.
>
> I am now convinced that this is the essential difference between people and ourselves. And therefore, not even considering the other ways in which we are superior, but considering just this one virtue, we can bravely claim to stand higher than men on the ladder of living creatures. The actions of men, at least those with whom I have had dealings, are guided by *words*—ours, by deeds.

The horse is killed before the end of the story, but the manner of the narrative, its technique, does not change:

> Much later they put Serpukhovsky's body, which had experienced the world, which had eaten and drunk, into the ground. They could profitably send neither his hide, nor his flesh, nor his bones anywhere.
>
> But since his dead body, which had gone about in the world for twenty years, was a great burden to everyone, its burial was only a superfluous embarrassment for the people. For a long time no one had needed him; for a long time he had been a burden on all. But nevertheless, the dead who buried the dead found it necessary to dress this bloated body, which immediately began to rot, in a good uniform and good boots; to lay it in a good new coffin with new tassels at the four corners, then to place this new coffin in another of lead and ship it to Moscow; there to exhume ancient bones and at just that spot, to hide this putrefying body, swarming with maggots, in its new uniform and clean boots, and to cover it over completely with dirt.

Thus we see that at the end of the story Tolstoy continues to use the technique even though the motivation for it [the reason for its use] is gone.

In *War and Peace* Tolstoy uses the same technique in describing whole battles as if battles were something new. These descriptions are too long to quote; it would be necessary to extract a considerable part of the four-volume novel. But Tolstoy uses the same method in describing the drawing room and the theater:

> The middle of the stage consisted of flat boards, by the sides stood painted pictures representing trees, and at the back a linen cloth was stretched down to the floor boards. Maidens in red bodices and white skirts sat on the middle of the stage. One, very fat, in a white silk dress, sat apart on a narrow bench to which a green pasteboard box was glued from behind. They were all singing something. When they had finished, the maiden in white approached the prompter's box. A man in silk with tight-fitting pants on his fat legs approached her with a plume and began to sing and spread his arms in dismay. The man in the tight

> pants finished his song alone; then the girl sang. After that both remained silent as the music resounded; and the man, obviously wanting to begin singing his part with her again, began to run his fingers over the hand of the girl in the white dress. They finished their song together, and everyone in the theater began to clap and shout. But the men and women on stage, who represented lovers, start to bow, smiling and raising their hands.
>
> In the second act there were pictures representing monuments and openings in the linen cloth representing the moonlight, and they raised lamp shades on a frame. As the musicians started to play the bass horn and counter-bass, a large number of people in black mantles poured onto the stage from right and left. The people, with something like daggers in their hands, started to wave their arms. Then still more people came running out and began to drag away the maiden who had been wearing a white dress but who now wore one of sky blue. They did not drag her off immediately, but sang with her for a long time before dragging her away. Three times they struck on something metallic behind the side scenes, and everyone got down on his knees and began to chant a prayer. Several times all of this activity was interrupted by enthusiastic shouts from the spectators.

The third act is described:

> . . . But suddenly a storm blew up. Chromatic scales and chords of diminished sevenths were heard in the orchestra. Everyone ran about and again they dragged one of the bystanders behind the scenes as the curtain fell.

In the fourth act, "There was some sort of devil who sang, waving his hands, until the boards were moved out from under him and he dropped down."[26]

In *Resurrection* Tolstoy describes the city and the court in the same way; he uses a similar technique in "Kreutzer Sonata" when he describes marriage—"Why, if people have an affinity of souls, must they sleep together?" But he did not defamiliarize only those things he sneered at:

> Pierre stood up from his new comrades and made his way between the campfires to the other side of the road where, it seemed, the captive soldiers were held. He wanted to talk with them. The French sentry stopped him on the road and ordered him to return. Pierre did so, but not to the campfire, not to his comrades, but to an abandoned, unharnessed carriage. On the ground, near the wheel of the carriage, he sat cross-legged in the Turkish fashion, and lowered his head. He sat motionless for a long time, thinking. More than an hour passed. No one disturbed him. Suddenly he burst out laughing with his robust, good natured laugh—so loudly that the men near him looked around, surprised at his conspicuously strange laughter.
>
> "Ha, ha, ha," laughed Pierre. And he began to talk to himself. "The soldier didn't allow me to pass. They caught me, barred me. Me—me—my immortal soul. Ha, ha, ha," he laughed with tears starting in his eyes.
>
> Pierre glanced at the sky, into the depths of the departing, playing stars. "And all this is mine, all this is in me, and all this is I," thought Pierre. "And all this they caught and put in a planked enclosure." He smiled and went off to his comrades to lie down to sleep.[27]

Anyone who knows Tolstoy can find several hundred such passages in his work. His method of seeing things out of their normal context is also apparent in his last works. Tolstoy described the dogmas and rituals he attacked as if they were unfamiliar, substituting everyday meanings for the customarily religious meanings of the words common in church ritual. Many persons were painfully wounded; they considered it blasphemy to present as strange and monstrous what they accepted as sacred. Their reaction was due chiefly to the technique through which Tolstoy perceived and reported his environment. And after turning to what he had long avoided, Tolstoy found that his perceptions had unsettled his faith.

The technique of defamiliarization is not Tolstoy's alone. I cited Tolstoy because his work is generally known.

Now, having explained the nature of this technique, let us try to determine the approximate limits of its application. I personally feel that defamiliarization is found almost everywhere form is found. In other words, the difference between Potebnya's point of view and ours is this: An image is not a permanent referent for those mutable complexities of life which are revealed through it; its purpose is not to make us perceive meaning, but to create a special perception of the object—*it creates a "vision" of the object instead of serving as a means for knowing it.*

---

[26] [Lemon and Reis] The Tolstoy and Gogol translations are ours. The passage occurs in Vol. II, Part 8, Chap. 9 of the edition of *War and Peace* published in Boston by the Dana Estes Co. in 1904–1912.

[27] [Lemon and Reis] Leo Tolstoy, *War and Peace*, IV, Art. 13, Chap. 14.

The purpose of imagery in erotic art can be studied even more accurately; an erotic object is usually presented as if it were seen for the first time. Gogol, in "Christmas Eve," provides the following example:

> Here he approached her more closely, coughed, smiled at her, touched her plump, bare arm with his fingers, and expressed himself in a way that showed both his cunning and his conceit.
>
> "And what is this you have, magnificent Solokha?" and having said this, he jumped back a little.
>
> "What? An arm, Osip Nikiforovich!" she answered.
>
> "Hmm, an arm! *He, he, he!*" said the secretary cordially, satisfied with his beginning. He wandered about the room.
>
> "And what is this you have, dearest Solokha?" he said in the same way, having approached her again and grasped her lightly by the neck, and in the very same way he jumped back.
>
> "As if you don't see, Osip Nikiforovich!" answered Solokha, "a neck, and on my neck a necklace."
>
> "Hmm! On the neck a necklace! *He, he, he!*" and the secretary again wandered about the room, rubbing his hands.
>
> "And what is this you have, incomparable Solokha?" . . . It is not known to what the secretary would stretch his longer fingers now.

And Knut Hamsun[28] has the following in *Hunger:* "Two white prodigies appeared from beneath her blouse."

Erotic subjects may also be presented figuratively with the obvious purpose of leading us away from their "recognition." Hence sexual organs are referred to in terms of lock and key,[29] or quilting tools,[30] or bow and arrow, or rings and marlinspikes, as in the legend of Stavyor, in which a married man does not recognize his wife, who is disguised as a warrior. She proposes a riddle:

"Remember, Stavyor, do you recall
How we little ones walked to and fro in the street?
You and I together sometimes played with a
marlinspike—
You had a silver marlinspike.
But I had a gilded ring?
I found myself at it just now and then,
But you fell in with it ever and always."
Says Stavyor, son of Godinovich,
"What! I didn't play with you at marlinspikes!"
Then Vasilisa Mikulichna: "So he says.
Do you remember, Stavyor, do you recall,
Now must you know, you and I together learned to
read and write;
Mine was an ink-well of silver,
And yours a pen of gold?
But I just moistened it a little now and then,
And I just moistened it ever and always."[31]

In a different version of the legend we find a key to the riddle:

Here the formidable envoy Vasilyushka
Raised her skirts to the very navel,
And then the young Stavyor, son of Godinovich,
Recognized her gilded ring. . . .[32]

But defamiliarization is not only a technique of the erotic riddle—a technique of euphemism—it is also the basis and point of all riddles. Every riddle pretends to show its subject either by words which specify or describe it but which, during the telling, do not seem applicable (the type: "black and white and 'red'—read—all over") or by means of odd but imitative sounds ("'Twas brillig, and the slithy toves / Did gyre and gimble in the wabe").[33]

Even erotic images not intended as riddles are defamiliarized ("boobies," "tarts," "piece," etc.). In popular imagery there is generally something equivalent to "trampling the grass" and "breaking the guelder-rose." The technique of defamiliarization is absolutely clear in the widespread image—a motif of erotic affectation—in which a bear and other wild beasts (or a devil, with a different reason for nonrecognition) do not recognize a man.[34]

[28] Knut Hamsun (1859–1952), Norwegian novelist.

[29] [Shklovsky] [Dimitry] Savodnikov, *Zagadki russkova naroda* [*Riddles of the Russian People*] (St. Petersburg, 1901), Nos. 102–7.

[30] [Shklovsky], Ibid., Nos. 588–91.

[31] [Shklovsky] A. E. Gruzinsky, ed., *Pesni, sobrannye P[avel] N. Rybnikovym* [*Songs Collected by P. N. Rybnikov*] (Moscow, 1909–1910, No. 30).

[32] [Shklovsky] Ibid., No. 171.

[33] From Lewis Carroll's *Jabberwocky*. [Lemon and Reis] We have supplied familiar English examples in place of Shklovsky's word-play. Shklovsky is saying that we create words with no referents or with ambiguous referents in order to force attention to the objects represented by the similar-sounding words. By making the reader go through the extra step on interpreting the nonsense word, the writer prevents an automatic response. A toad is a toad, but "tove" forces one to pause and think about the beast.

[34] [Shklovsky] E. R. Romanov, "Besstrashny barin" *Velikorusskiye skazki* (Zapiski Imperskovo Russkovo Geograficheskovo Obschestva XLII, No. 52). Belorussky sbornik, "Spravyadlivy soldat" ["The Intrepid Gentleman," *Great Russian Tales* (Notes of the Imperial Russian Geographical Society, XLII, No. 52). White Russian Anthology, "The Upright Soldier (1886–1912)].

The lack of recognition in the following tale is quite typical:

> A peasant was plowing a field with a piebald mare. A bear approached him and asked, "Uncle, what's made this mare piebald for you?"
>
> "I did the piebalding myself."
>
> "But how?"
>
> "Let me, and I'll do the same for you."
>
> The bear agreed. The peasant tied his feet together with a rope, took the ploughshare from the two-wheeled plough, heated it on the fire, and applied it to his flanks. He made the bear piebald by scorching his fur down to the hide with the hot ploughshare. The man untied the bear, which went off and lay down under a tree.
>
> A magpie flew at the peasant to pick at the meat on his shirt. He caught her and broke one of her legs. The magpie flew off to perch in the same tree under which the bear was lying. Then, after the magpie, a horsefly landed on the mare, sat down, and began to bite. The peasant caught the fly, took a stick, shoved it up its rear, and let it go. The fly went to the tree where the bear and the magpie were. There all three sat.
>
> The peasant's wife came to bring his dinner to the field. The man and his wife finished their dinner in the fresh air, and he began to wrestle with her on the ground.
>
> The bear saw this and said to the magpie and the fly, "Holy priests! The peasant wants to piebald someone again."
>
> The magpie said, "No, he wants to break someone's legs."
>
> The fly said, "No, he wants to shove a stick up someone's rump."[35]

The similarity of technique here and in Tolstoy's "Kholstomer," is, I think, obvious.

Quite often in literature the sexual act itself is defamiliarized; for example, the *Decameron*[36] refers to "scraping out a barrel," "catching nightingales," "gay wool-beating work" (the last is not developed in the plot). Defamiliarization is often used in describing the sexual organs.

A whole series of plots is based on such a lack of recognition; for example, in Afanasyev's[37] *Intimate Tales* the entire story of "The Shy Mistress" is based on the fact that an object is not called by its proper name—or, in other words, on a game of nonrecognition. So too in Onchukov's[38] "Spotted Petticoats," tale no. 525, and also in "The Bear and the Hare" from *Intimate Tales,* in which the bear and the hare make a "wound."

Such constructions as "the pestle and the mortar," or "Old Nick and the infernal regions" *(Decameron),* are also examples of the technique of defamiliarization. And in my article on plot construction I write about defamiliarization in psychological parallelism. Here, then, I repeat that the perception of disharmony in a harmonious context is important in parallelism. The purpose of parallelism, like the general purpose of imagery, is to transfer the usual perception of an object into the sphere of a new perception—that is, to make a unique semantic modification.

In studying poetic speech in its phonetic and lexical structure as well as in its characteristic distribution of words and in the characteristic thought structures compounded from the words, we find everywhere the artistic trademark—that is, we find material obviously created to remove the automatism of perception; the author's purpose is to create the vision which results from that deautomatized perception. A work is created "artistically" so that its perception is impeded and the greatest possible effect is produced through the slowness of the perception. As a result of this lingering, the object is perceived not in its extension in space, but, so to speak, in its continuity. Thus "poetic language" gives satisfaction. According to Aristotle, poetic language must appear strange and wonderful;[39] and, in fact, it is often actually foreign: the Sumerian used by the Assyrians, the Latin of Europe during the Middle Ages, the Arabisms of the Persians, the Old Bulgarian of Russian literature, or the elevated, almost literary language of folk songs. The common archaisms of poetic language, the intricacy of the sweet new style [*dolce stil nuovo*],[40] the obscure style of the language of Arnaut Daniel[41] with the "roughened" [*harte*] forms *which make pronunciation difficult*—these are used in much the same way. Leo Jakubinsky has demonstrated the principle of phonetic "roughening" of poetic language in the particular case of the repetition of identical sounds. The language of poetry is, then, a difficult, roughened, impeded language. In a few special instances the language of poetry approximates the language of prose, but this does not violate the principle of "roughened" form.

> Her sister was called Tatyana.
> For the first time we shall
> Wilfully brighten the delicate
> Pages of a novel with such a name.

wrote Pushkin.[42] The usual poetic language of Pushkin's contemporaries was the elegant style of Derzhavin;[43] but Pushkin's style, because it seemed trivial then, was unexpectedly difficult for them. We should remember the consternation of Pushkin's contemporaries over the vulgarity of his expressions. He used the popular language as a special device for prolonging attention, just as his contemporaries generally used Russian words in their usually French speech (see Tolstoy's examples in *War and Peace*).

Just now a still more characteristic phenomenon is under way. Russian literary language, which was originally foreign to Russia, has so permeated the language of the people that it has blended with their conversation. On the other hand, literature has now begun to show a tendency towards the use of dialects (Remizov, Klyuyev, Essenin, and others,[44] so unequal in talent and so alike in language, are intentionally provincial) and of barbarisms (which gave rise to the Severyanin group[45]). And currently Maxim Gorky is changing his diction from the old literary language to the new literary colloquialism of Leskov.[46] Ordinary speech and literary language have thereby changed places (see the work of Vyacheslav Ivanov[47] and many others). And finally, a strong tendency, led by Khlebnikov,[48] to create a new and properly poetic language has emerged. In the light of these developments we can define poetry as *attenuated, tortuous* speech. Poetic speech is *formed speech.* Prose is ordinary speech—economical, easy, proper, the goddess of prose [*dea prosae*] is a goddess of the accurate, facile type, of the "direct" expression of a child. I shall discuss roughened form and retardation as the general *law* of art at greater length in an article on plot construction.[49]

Nevertheless, the position of those who urge the idea of economy of artistic energy as something which exists in and even distinguishes poetic language seems, at first glance, tenable for the problem of rhythm. Spencer's description of rhythm would seem to be absolutely incontestable:

> Just as the body in receiving a series of varying concussions, must keep the muscles ready to meet the most violent of them, as not knowing when such may come: so, the mind in receiving unarranged articulations, must keep its perspectives active enough to recognize the least easily caught sounds. And as, if the concussions recur in definite order, the body may husband its forces by adjusting the resistance needful for each concussion; so, if the syllables be rhythmically arranged, the mind may economize its energies by anticipating the attention required for each syllable.[50]

This apparently conclusive observation suffers from the common fallacy, the confusion of the laws of poetic and prosaic language. In *The Philosophy of Style* Spencer failed utterly to distinguish between them. But rhythm may have two functions. The rhythm of prose, or of a work song like "Dubinushka," permits the members of the work crew to do their necessary "groaning together" and also eases the work by making it automatic. And, in fact, it is easier to march with music than without it, and to march during an animated conversation is even easier, for the walking is done unconsciously. Thus the rhythm of prose is an important automatizing element; the rhythm of poetry is not. There is "order" in art, yet not a single column of a Greek temple stands exactly in its proper order; poetic rhythm is similarly disordered rhythm. Attempts to systematize the irregularities have been made, and such attempts are part of the current problem in the theory of rhythm. It is obvious that the systematization will not work, for in reality the problem is not one of complicating the rhythm but of disordering the rhythm—a disordering which cannot be predicted. Should the disordering of rhythm become a convention, it would be ineffective as a device for the roughening of language. But I will not discuss rhythm in more detail since I intend to write a book about it.[51]

---

[42] Alexander Sergeyevick Pushkin (1799–1837), Russian poet.

[43] Gavril Romanovich Derzhavin (1743–1816), Russian writer

[44] [Lemon and Reis] Alexy Remizov (1877–1957) is best known as a novelist and satirist; Nicholas Klyuyev (1885–1937) and Sergey Essenin (1895–1925) were "peasant poets." All three were noted for their faithful reproduction of Russian dialects and colloquial language.

[45] [Lemon and Reis] A group noted for its opulent and sensuous verse style.

[46] [Lemon and Reis] Nicholas Leskov (1835–1895), novelist and short story writer, helped popularize the *skaz*, or yarn, and hence, because of the part dialect peculiarities play in the *skaz*, also altered Russian literary language.

[47] Vyacheslav Ivanov (1866–1949), Russian symbolist poet.

[48] Velimir Khlebnikov (1885–1922), Russian Futurist poet and critic.

[49] [Lemon and Reis] Shklovsky is probably referring to his *Razvyortyvaniye syuzheta* [*Plot Development*] (Petrograd, 1921).

[50] [Lemon and Reis] Spencer, page 169. Again the Russian text is shortened from Spencer's original.

[51] [Lemon and Reis] We have been unable to discover the book Shklovsky promised.

T. S. Eliot

1888–1965

T. S. Eliot was probably the most influential poet and critic of the first half of the twentieth century. He was born in St. Louis and educated at Harvard, where he came under the influence of Irving Babbitt, who was highly critical of Romanticism (see especially his *Rousseau and Romanticism* [1919]). Eliot was also acquainted with the self-proclaimed classicist T. E. Hulme, who in his *Speculations* (written in 1913–1914, posthumously published in 1924) called Romanticism "spilt religion" and warned against poetry that "flies away into the circumambient gas." These views Eliot tempered somewhat later in life, but his tastes remained generally "classicist." Indeed, in 1928 he characterized himself as "classical in literature, royalist in politics, Anglo-Catholic in religion." But Eliot's classicism might better be called traditionalism. His raising up of John Donne and the seventeenth-century metaphysical poets is connected with his earliest views, and his essays on them and on Renaissance drama exercised a major influence on the American New Criticism.

In the well-known essay *Tradition and the Individual Talent* (1917) Eliot attacks certain emphases in Romanticism: the cult of originality and the idea that a poem is primarily an expression of the poet's personality. Eliot argues that a great poem always implies its relation to the works of previous poets and artists and that a poet must develop a sense of the presentness as well as the pastness of the past. For Eliot, the poet expresses not a personality but a medium, and it is his concern for the medium that is reflected in those influenced by him. For Eliot, poetry is not a "turning loose of emotion but an escape from emotion." Some commentators have accused Eliot, on the basis of such remarks, of antipoetical coldness. Eliot's point, however, is more like the one Keats made with his term "negative capability" (above, page 536).

Eliot refers in a later essay, *The Frontiers of Criticism* (1956), to "a few of [his] notorious phrases which have had a truly embarrassing success in the world." One of these is surely the "objective correlative," offered in his essay *Hamlet and His Problems* (1919). He describes it as "a set of objects, a situation, a chain of events which shall be the formula for that *particular* emotion" which is the poem's (not the author's) intent. Eliot's argument in the essay is that there is no such thing in *Hamlet,* for the main character is "dominated by an emotion which is inexpressible, because it is in excess of the facts as they appear." Eliot's later view warns against explanations of a poem based on inquiry into origins, while resisting the idea that a poem has just one correct interpretation. We particularly recommend *The Frontiers of Criticism* for Eliot's very cogent reflections on the rise of academic criticism, taking a broader view, but urging that readers ask "when is criticism not literary criticism but something else?"

Eliot's critical works include *The Sacred Wood* (1920), *The Uses of Poetry and the Use of Criticism* (1933), *After Strange Gods* (1934), *Essays Ancient and Modern* (1936), *Christianity and Culture* (1940), *Selected Essays* (rev. ed., 1950), and *On Poetry and Poets* (1957). See F. O. Matthiessen, *The Achievement of T. S. Eliot* (rev. ed., 1947);

Tradition and the Individual Talent

I

In English writing we seldom speak of tradition, though we occasionally apply its name in deploring its absence. We cannot refer to "the tradition" or to "a tradition"; at most, we employ the adjective in saying that the poetry of so-and-so is "traditional" or even "too traditional." Seldom, perhaps, does the word appear except in a phrase of censure. If otherwise, it is vaguely approbative, with the implication, as to the work approved, of some pleasing archaeological reconstruction. You can hardly make the word agreeable to English ears without this comfortable reference to the reassuring science of archaeology.
